INDEX.

List of sub-headings:—AUTHORS, BANKRUPTCY PROCEEDINGS, CITY NOTES, CONTRACTS CLOSED AND OPEN, CORRESPONDENCE, INSTITUTION AND LECTURE NOTES, LEGAL, LIGHTING AND POWER NOTES, LIQUIDATIONS, NEW COMPANIES, NEW ELECTRICAL DEVICES, FITTINGS AND PLANT, OBITUARY, OFFICIAL RETURNS, PROCEEDINGS OF SOCIETIES AND INSTITUTIONS, PROSPECTUSES, RAILWAY NOTES, REVIEWS, TELEGRAPH NOTES, TELEPHONE NOTES, TRAMWAY NOTES, WAR ITEMS.

ACCIDENTS, 704, 739

Accounting by machinery, Cost, 102
Accumulator works, Lead poisoning in, Action, Ideas and, 454
506, 625, 652, 710
Advisory Council, The, 330
Agents and commission, 327
Agriculture, Electricity in, 410, 666
Aircraft constructors, 480
Alien enemies, Patents and, 53, 117, 172, 373, 423, 509
Allen members, The Institution of Electrical Engineers and, 33, 83, 177, 190, 206, 275, 279, 289, 307, 316, 359, 506, 625, 652, 710
Alloys, Resistance, 652
Aluminium industry, The future of the, 694
Aluminium in Norway, 687
Amalgamated Society of Engineers, 305
Ambulance cars, Radiograph, 176
America and export trade development, 576
America and foreign trade, 127
America, Hydro-electric development in, 523
American electric cooking campaign, 569
American electric cooking conditions, 58
American electrical exports, 312, 512, 647
American General Electric; Bonus to employees, 459
American lamp patents, 275
America's electrical week, 569
Antenna, Effect of imperfect dielectrics in the field of a radiotelegraphic, 596
Appeal to the Government, Trade after the war: An influential, 130
Appointments vacant, 21, 54, 82, 116, 150, 178, 260, 290, 345, 373, 429, 460, 485, 513, 543, 570, 597, 625, 652, 683, 711, 738
Argentina, Electrical trade in, 485
Argentine naval electrical specifications, 345
Argentine railway electrification, Central, 555
Argentine Republic, Electrical imports to the, 537
Artists' Rifles O.T.C., 178
Association of Electrical Station Engineers, 569
Austin field workshop electric generating plant, 422
Australia, Edison's showrooms in, 256
Australia, Electrical trade in, 387
Australia, Science and industry in, 229
Australia, Scientific research in, 569
Australia, Shortage of electricians in, 344
Australia, Steel shortage in, 708
Australia, The voice of, 331
Australia, Trade with—Trade Commissioner's visit, 479
Australian electrical contract conditions, 25, 460
Australian engineers for Australia, 459
Australian imports, 536
Australian insulators, 733
Australian metals developments, 682
Australian Patents Board, 153
Australian preferences, 461
Australian Trade Commissioner, 177

AUTHORS—

Archdeacon, G. R., on Tips from China, 27; on The engineer in the tropics, 303; on Battery rooms, 612
Austin, E. P., on A rotary converter installation, 506
Batho, W., on Tar oils as fuel for Diesel engines, 326
Beard, J. R., on The design of high pressure distribution systems, 28, 61, 92, 125, 156, 168
Beardmore, Sir W., on The application of science in factories, 509
Beatty, P., and A. F. Smith, on The effect of the presence of moisture in gas coke fuel, 415
"Belgian," on Dutch manufacturers and future trade in Belgium, 27

AUTHORS—continued.

Brighten, E., on British engineering trade expansion, 38
Butler, E. F., on Control gear for direct-current motors, 697, 744
Carter, F. W., on The electric locomotive, 94; on The resistance of a cube, 332
Crabtree, J. A., on The renaissance of the low tension fuse, 276, 323
Cramer, R., on High steam pressures, 43
Darrah, W. A., on The electric arc in vapours and gases at reduced pressures, 215
Dixon, L. W., on Electricity supply development in a straggling industrial area, 191
Dobson, Prof. J. H., on Johannesburg electricity supply, 222
Dornan, J., on The electric propulsion of ships, 41
Eaton, G. M., on Chattering wheel slip in electric motive power, 298
Elder, T. C., on The business side of science, 449
Farnham, R. V., on A suction gas producer using bituminous coal, 351
Field, Prof. A. B., on Some difficulties in the design of high-speed generators, 63
Fleming, A. P. M., on Industrial research in the U.S.A., 418
Harrison, H. H., on Modern printing telegraphy, 184, 221
Hill, H. P., on Electrical precipitation of smoke and dust, 660
Hirsch, H. H., on The Hirsch portable electric lamp, 197
Hoadley, E. E., on The efficiency of labour, 464
Hobart, H. M., on Electric railways design and operation, 728
Hull, A. W., on The production of constant high potential with moderate power output, 364
Jeffery, C. S., on The electric cooker in India, 502
Joseph, H., on The hire and maintenance of continuous current motors, 407, 436
Lackie, W. W., on Boiler house design and operation, 728
Lees, S., on Direct current motor maintenance, 4, 57
Macleod, D. M., on Service branches from extra-high tension circuits, 388
Makower, A. J., on The resistance of a cube, 267
Marks, John, on The neglect of commercial matters by the engineer, 277; on Labour demands and responsibilities after the war, 550
Mawdesley, R. Turnbull, on Municipal electricity supply at Johannesburg, 89, 100, 153, 168
Morgan, J. D., on The ignition of explosive gas mixtures by electric sparks, 10
Muto, G. K., on The electric lighting of small towns, 644
Nelson, G. H., on Electrical trade after the war, 249
Nicoll, W. L., on Coke as a boiler fuel, 39
Pannell, E. V., on Continuous current railway motors, 296, 324, 333
Paton, G. K., on Electric power in slate quarries, 494
Portman, R. S., on The Ljungström turbine and its application to marine propulsion, 519, 547
Record, O. L., on Testing underground cables with continuous current, 185, 304
Ridsdale, C. H., on The electrical testing of steel conductor rails, 689

AUTHORS—continued.

"Rover," on From the power house window, 547; on Some hydro troubles in Canada, 687
Sand, Dr. H. J. S., on An enclosed cadmium-vapour arc lamp, 250
Smith, A. F., and P. Beatty, on The effect of the presence of moisture in gas coke fuel, 415
Smith, Prof. C. A. Middleton, on electric generating stations in China, 188
Smith, W. B., on Electricity in small households, 701
"Station Engineer," on Concerning Discounts, 254
"Station Superintendent," on A turbo-generator steam consumption test, 234, 240
Stewart, W. N., on What to do with our canals, 295
Storer, N. W., on Direct current traction at 5,000 volts, 343; on The use of continuous current for terminal and trunk line electrification, 354, 380, 409, 493
T. E. C. H., on Ball bearings for electric motors, 379
Thornton, Dr. W. M., on The nature of electrical insulation, 634
Tooke, W. A., on Internal-combustion-driven electrical sets, 670
Walker, Prof. Miles, on The predetermination of the performance of dynamo-electric machinery, 68, 125, 137
"Whitfield," on Coal prices: A tragedy in limitation, 30
Wilkinson, S., on Electric heating: its present position and future development, 136
Williams, E. T., on The electricity supply of Great Britain, 447, 575, 592
Yensen, T. D., on The effect of vacuum fusion upon the magnetic properties of iron, 643
Automobiles, Switch control for, 465

BALL bearings for electric motors, by

T. E. C. H., 379
Ball bearings on railway rolling stock, 96
Ballater, Electricity supply at, 360
Bank for Russian industry, British, 682

BANKRUPTCY PROCEEDINGS—

Birkett, W. D., 285, 338, 368
Bonner, G. E., 111, 143, 200, 230, 396, 647
Boul, J., & J. H. Bolt, 705
Brook, J., 705
Clark, J. P. K., 78
Connold, R. E., 564, 622, 733
Craig, A. B., 253
Garbutt, A., 16, 49, 172
Hawdon, A. F., 480, 565, 593, 676
Leibbrand, C. H., 172
Loader, A. J., 239
Page, H. (Cremation & Page), 676
Parfitt, G. J. T., 78, 255, 313
Pieddie, J. Taylor, 200, 285, 456
Poulton, F. C., 647
Slatter, 200
Steel Bros., 508, 593
Swainson, J., 460
Tattersall, J. W. & T. W., 338, 508
Watts, F. H., 239
West, H. A., 78
Whitehouse, J., 255, 313, 338
Wild, W. C., 16, 78, 230, 537

Banks, Industrial, 176
Bath, Fatality in the, 219
Batteries, Municipal loans for storage, 460
Battery cars, Electromobile, 248
Battery-driven recruiting van, A, 642
Battery locomotive, An electric, 225
Battery rooms, by G. R. Archdeacon, 612
Battery sub-station, A large, 445
Battery vehicle, A railless trolley, 557
Batti-Wallahs' Society, The, 559, 371

Belgium, American reconstruction work in, 512
Belgium, British manufacturers and future trade in, by "Belgian," 27
Benevolent Institution, Electrical Trades, 310, 372, 710
Benjamin Electric Works, The, 734
Bequest, 543
Birthday honours, 653
Black list, Electricity supply engineers and an enemy, 177
Blast furnaces, Tapping, 219
Board of Trade Advisory Committee's report on British industry after the war, 161, 163, 212
Board of Trade Commercial Intelligence Branch, 34, 480
Board of Trade inquiries, 79, 255, 283, 285, 676, 734
Boards of employés, American General Electric, 459
Bonuses, London County Council's war, 460
Books for British prisoners of war, Educational, 708
Brazil, German samples from, 313
Brazil, Inquiry from, 230
Breakdown of governors in hydro-electric station, 636
Bribery prevention, 511
Bristol Corporation and enemy goods, 30
British Association meeting, 680
British Columbia, An inquiry from, 112
British Electrical and Allied Manufacturers' Association, 148, 187
British Electrical and Allied Manufacturers' Association, Discussion on commercial mobilisation, 107
British engineering trade expansion, by E. Brighten, 38
British Engineers' Association, 710
British industries fair, The, 230
British industry after the war. Board of Trade Advisory Committee's report, 161, 163, 212
British manufacturers and future trade in Belgium, by "Belgian," 27
British Manufacturers' Association—One too many, 415
British manufacturing and the Russian market, 241
British Thompson-Houston Co., The, 82
Buenos Ayres, Financial troubles at, 35
Bullet extractor, An electric, 371
Burnley, Three-phase extensions at, 331
Business-getting abroad, 470
Business languages of South America, 512
Business organisation, National, 66

CABLE, An 11,000-volt submarine,

445
Cable codes and telegraphic addresses—an important detail, 439
Cables after the war, Germany's submarine, 101
Cables, Submarine power, 178
Callender's hospital fund, 153
Canada, Inquiry from, 229
Canada, Notes from, 166, 391
Canada, Some hydro troubles in, by "Rover," 687
Canada, The outlook in, 37
Canada, Trade statistics of, 31
Canada, Power plants, Protecting, 607
Canadian trade, 564
Canal comedy, A, 568
Canals, What to do with our, by W. N. Stewart, 295
Carbons, Economy in, 322
Carbons for Italy, American, 110
Cartels, German, 597
Catalogues, German, 119
Caucasus, Electrical trade in the, 536
Central Argentine railway electrification, 555
Ceylon Import trade of, 290
Charges to electricity consumers, 88
Cheap power, 512
Chemical combine, German, 587
Chemical plants, Power and heat for, 651

Chemical Society and alien enemy members, 768, 710
 Chemistry at University College, 435
 Chicago, The largest supply undertaking in the world, 681
 Child, A high pressure plant in, 378
 China, British trade in, 21
 China, General Electric Co.'s electrical plant for, 284
 China, Import trade of, 439
 China stopped, Electrical machinery for, 205
 China, Tips from, by G. R. Archdeacon, 27
 China, Trade in: Catalogues wanted, 112
 Chinese power house bombed, 84
 Church lighting without fittings, 617

CITY NOTES—

Adelaide Electric Supply Co., 602
 Alderley & Wilmshurst Electric Supply, 517
 Alldays & Onions Pneumatic Eng. Co., 377
 Alley MacLellan, 377
 Altrincham Electric Supply Co., 432
 Aluminium Corporation, 714, 740
 American Telephone & Telegraph Co., 400
 Anchor Cable Co., 601
 Anglo-American Telegraph Co., 55, 461, 517
 Anglo-Argentine Tramways Co., 573, 601, 655, 714, 741
 Anglo-Portuguese Telephone Co., 545, 600
 Arkrath Electric Light & Power Co., 376
 Argentine Tramways & Power Co., 628
 Auckland Electric Tramways Co., 545
 Austrian Cable Works, 489
 Austrian Electrical Companies, 516
 Automatic Telephone Manufacturing Co., 265, 320, 346, 376, 685
 Balcock & Wilcox, 573
 Bath Electric Tramways, 489, 516
 Beaulieu Electric Supply Co., 405

 Bell's United States Telephone Co., 209
 Berlin Elevated & Underground Railway, 403
 Birmingham District Power & Traction Co., 373
 Blackpool & Fleetwood Tramroad Co., 151
 Bombay Electric Supply & Tramways Co., 376, 602
 Bombay Telephone Co., 433
 Bournemouth & Poole Electricity Supply, 238, 292, 349
 Braby, F., & Co., 209
 Braintree Electric Light & Power Co., 87, 293, 462, 658
 Brisbane Electric Tramways & Investment Co., 546
 Bristol Tramways & Carriage Co., 237
 British Aluminium Co., 348, 377, 404
 British Coalite Co., 490
 British Columbia Electric Railway Co., 22
 British Electric Traction Co., 293, 373, 684
 British Electric Transformer Co., 293, 320, 347
 British Engine, Boiler & Electrical Insurance Co., 544
 British Ever-Ready Co., 544
 British Insulated & Helsby Cables, 238, 349, 376
 British L. M. Ericsson Manufacturing Co., 263, 347
 British Westinghouse Electric & Manufacturing Co., 349, 403, 431
 Bromley (Kent) Electric Light & Power Co., 376
 Brompton & Kensington Electricity Supply Co., 348, 376, 403
 Browett, Lindley & Co., 496
 Bruce Peebles & Co., 293, 319
 Brush Electrical Supply Co., 432, 487
 Buenos Ayres Lacroze Tramways Co., 55
 Bullers, 714
 Calcutta Electric Supply Corporation, 23, 181, 265, 405, 491, 515, 516, 572, 658
 Calcutta Tramways Co., 489, 545
 Calgary Power Co., 546
 Callender's Cable & Construction Co., Ltd., 572, 628
 Cambridge Electric Supply Co., 181, 209, 434
 Canadian General Electric Co., 293, 431, 638
 Canadian Westinghouse Co., 545
 Castner-Kellner Alkali Co., 802
 Central Electric Supply Co., Ltd., 181
 Central London Railway Co., 209, 377
 Charing Cross, West End & City Electricity Supply Co., 263, 376
 Chatham & District Light Railways Co., 181
 Chelsea Electricity Supply Co., 209, 263, 320
 Chesham Electric Light and Power Co., Ltd., 572
 Chiswick Electricity Supply Co., 515
 City & South London Railway Co., 210, 237
 City Electric Light Co., Ltd. (Brisbane), 517
 City of Buenos Aires Tramways Co. (1904), Ltd., 151, 181, 518
 City of London Electric Lighting Co., 265, 318, 494

CITY NOTES—continued.

Cleveland, Portishead & District Electric Supply Co., 432
 Cleveland & Durham Electric Power Co., 376, 402
 Clyde Valley Electrical Power Co., 349
 Colombo Electric Tramways & Lighting Co., 489
 Commercial Cable Co., 658
 Compania de Electricidad de la Provenencia de Buenos Aires, 348
 Companies struck off the register, 119
 Consolidated Diesel Engine Manufacturers, Ltd., 517
 Consolidated Electrical Co., 741
 Cord Electric Tramways & Lighting Co., 433
 County of London Electric Supply Co., 265, 318
 Coventry Chain Co., 713
 Craigpark Electric Cable Co., 546, 573
 Crossley Bros., 209
 Cuba Submarine Telegraph Co., 488
 Davis & Timmins, 209, 263
 Dawlish Electric Light & Power Co., 461
 Delhi Electric Tramways & Lighting Co., 629
 Direct Spanish Telegraph Co., 321, 349
 Direct United States Cable Co., 55, 432, 439
 Direct West India Cable Co., 238
 Doulton & Co., 320, 602
 Dublin & Lucan Electric Railway, 262, 419
 Dublin United Tramways (1896) Co., 55, 181
 East London Railway Co., 87
 Eastern Extension, Australasia and China Telegraph Co., 433, 373
 Eastern Telegraph Co., 433, 545, 573, 656, 714
 Electric Construction Co., 600, 627
 Electrical and Industrial Investment Co., 181
 Electrical Distribution Co. of Yorkshire, 209, 291
 Electrical Utilities Corporation, 87
 Electro Bleach & By-Products, 265
 Evered & Co., 375
 Falkirk & District Tramways Co., 403
 Ferranti, 657
 Fife Tramway, Light & Power Co., 265
 Folkestone Electricity Supply Co., 377, 402
 French electrical companies, 85, 263, 376, 372
 French Thomson-Houston Co., 714
 French tramway companies, 462
 General Electric Co. (U.S.A.), 571
 German electrical companies, 86, 346, 432, 515, 571, 654, 712
 German Netherlands Telegraph Co., 712
 German transport companies, 86
 Globe Telegraph & Trust Co., 293, 349, 741
 Glover, W. T., & Co., 321, 403
 Great Northern Telegraph Co. of Denmark, 461, 602, 635
 Greenwood & Bailey, 55
 Hadfield's, 350
 Halifax & Bermudas Cable Co., 238
 Harrow Electric Light & Power Co., 291
 Hart Accumulator Co., 741
 Hastings & District Electric Tramways, 349
 Henley's Telegraph Works Co., W. I., 293, 348, 404
 Heston Gas & Electric Supply Co., 434
 Imperial Tramways Co., 711
 India Rubber, Gutta Percha & Telegraph Works Co., Ltd., 299
 Indian Electric Supply & Traction Co., 518, 545
 Indo-European Telegraph Co., 628, 655
 International Light & Power Co., 349
 International Lighting Association, 434
 Isle of Wight Light & Power Co., 434
 Jackson, P. R., & Co., 348
 Jarrold & District Electric Traction Co., 264
 Johnson & Phillips, 488, 516
 Johnson, R., Clapham & Morris, 546
 Kalgoolie Electric Power & Lighting Corporation, 433, 373, 628
 Kaminstiquia Power Co., 239
 Keith, Blackman, James, & Co., 740
 Kempsey (Aust.) Electric Light & Power Co., 434
 Kensington & Knightsbridge Electric Lighting Co., 210, 237, 319
 Kidderminster & District Electric Lighting & Traction Co., 373
 Lancashire Tramways Co., 181
 Lancashire Dynamo & Motor Co., 433, 654
 Lancashire Power Construction Co., 685, 741
 Lancashire United Tramways, 265, 291
 La Plata Electric Tramways, 462
 Launceston & District Electric Supply Co., 321, 348
 Leamington & Warwick Electrical Co., 454
 Lima Light, Power & Tramways Co., 629

As a nation we know a good deal more about German means and methods than we did a year and a half ago, and the voices of those who have cried for years in the wilderness anent the national importance of industrial reform are now listened to. The outstanding characteristic of the German is his thoroughness. It permeates his every walk of life—even his methods of "frightfulness." At times this characteristic, coupled with a good proportion of *Dummheit*, leads him into the most absurd and "impossible" of situations (as witness the majority of his diplomatic machinations)—at times, it leads him into a positive bewilderment of micro-detail (as witness many of his researches, which produce an amazing wealth of indigestible data but no conclusions). These, however, are the results of becoming obsessed by the system, and they do not alter the fact that Teutonic developments during the past fifty years have largely resulted from Teutonic thoroughness. Without any attempt to transplant a German quality to an uncongenial soil we shall do well to adapt any good features that we have observed in German industrialism and commercialism to our own circumstances before the German detects and tries to remedy the defects of his system.

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AOREKAY, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, £1 1s. 8d. Canada, £1 3s. 10d. (\$5.80). Postage inclusive, in Great Britain, To all other countries, £1 10s.

NOTICE.

IN view of the recent increase in the Postal Charges, our Subscription Rates for Great Britain and Canada will until further notice be increased to £1 1s. 8d. and £1 3s. 10d. respectively.

so that no suspicion of private interest be aroused, and it is equally important that it be understood that the co-operation of every firm, large and small, is needed. There can thus be formed what may be called an Industrial Parliament, entirely free from the baneful influence of politicians. Its resources will be immense without placing any appreciable burden on individual "constituents." Provided that there is nothing of a hole-in-the-corner nature about the floating of such a scheme, there seems to be no reason why it should not at once assume national proportions. As a national organisation, embracing every industry, nothing could resist its activities, and we believe that on a proper elective basis it would command general confidence and energetic support.

A matter closely associated with the lessons in national industrial organisation and intensive organisation of individual works taught to us by the present war, is the value of national testing and approving. For years past the National Physical Laboratory has been gaining rapidly in reputation, and ever-increasing numbers of private firms have taken advantage of the services it offers in standardisation and testing work. Now that it has been made the final arbiter in so many matters connected with the production of munitions, its scope and qualifications should be brought home more clearly than ever to manufacturers all over the country, and its relations with British industry should be permanently improved thereby, to the benefit of all concerned.

It is no mean work which the National Physical Laboratory has accomplished in extending its staff and equipment to undertake the responsible work of testing wireless and all sorts of other electrical equipment—on top of an immense amount of research work and mechanical standardisation and testing, such as inspection of gauges (the final arbiter of accuracy in shell production), testing constructional materials, and so on. In due course publication of what has been done, and the means whereby the high standard of precision has been maintained, should inspire confidence and excite that interest which has unfortunately been rather lacking in the past. In short, its services in war work should place national testing and standardisation on a broader, firmer basis than heretofore. This, in conjunction with the revolutionary reorganisation which has taken place in our industry as a whole, will place us in a much better position to face the industrial struggle to come. And there is reason to believe that we shall need every advantage that can be given to us by circumstances and by our own efforts.

Telephony in 1915.

THE outbreak of the conflict now raging between civilisation and barbarism cut short experimental research in the Old World and compelled our investigators to turn their attention from peaceful progress to the arts of war; especially was research in wireless telegraphy and telephony forbidden ground except to the scientific staffs of the Army and Navy. Just before the commencement of the war sundry hints were thrown out by the Marconi Co. as to the approaching success of its efforts to place wireless telephony on a commercial footing, but whether sufficient progress had been made to enable our defenders to make use of it in the course of their operations we do not know, and if we did, we should not tell. But in the Western Hemisphere no such restrictions obtained, and our American friends made good use of the unique opportunities at their command, with the result that the year 1915 will for ever be distinguished by two great achievements—trans-Continental and trans-Atlantic telephony.

The former was inaugurated on January 25th, when the veteran inventor of the telephone, Dr. Alexander Graham Bell, conversed with his assistant of 1876, Mr. T. A.

Watson, over 3,400 miles of line between New York and San Francisco, a line consisting of 1,480 tons of copper wire per circuit, carried on no fewer than 180,000 poles. That the human voice unaided should be capable of energising so great a mass of metal, of so attenuated dimensions, so effectually as to be recognisable at the far end of the line, is inconceivable; the feat, in fact, was only made possible by injecting into the circuit energy derived from external sources by the aid of relays, the development of which in itself was a striking achievement.

No such assistance *en route* was possible in the case of wireless telephony; once launched, the etherial vibrations must pursue their course on their own merits, and therefore we may perhaps regard the latter accomplishment as the more remarkable, although it represented only a tentative performance, and has not, like the former, become a commercial proposition. In this instance the human voice controlled at their source electric waves which traversed a distance of 4,900 miles, and still remained capable of being understood when reconverted into sound waves. As the longest distance covered in the former case was 4,750 miles, the palm for the greatest distance of transmission of speech must be awarded to wireless telephony. What will be accomplished in the future we cannot say, but we can safely predict that future achievements will put in the shade anything that we dare imagine now. And these two great feats in themselves suffice to mark the year as one of the most notable in the history of electrical methods of communication.

Copper.

THERE has been no holding back the copper market, the strength of which increased daily during the closing weeks of the old year, and which shows no signs whatever of relaxing. There has been an enormous business done in America, a large proportion of which was on behalf of the Allied Governments, and it was the buying in this connection which definitely pushed the market up to round 22 cents a lb. for electrolytic, the movement in America being followed by an upward rush in prices here which has carried refined material to about £111 a ton c.i.f. Liverpool. The position is one of the greatest gravity, for stocks have been reduced to entirely trifling proportions, and it seems hopeless to look for any substantial abatement in the material conditions ruling the market at the present juncture. It is all too apparent that the world's production has proved unequal to meeting the enormous demands for munitions. While production cannot well be extended, there seems no limit to the absorption of metal for war purposes. It is estimated by those in a position to speak with some authority, that the Allies are using up about 35,000 to 40,000 tons of copper a month, and the estimate seems to be pretty well based as far as can be ascertained from the broad indications available.

There are, of course, no approximate figures either of production or consumption now issued, but as the world's output of copper can be put down at about a million tons a year, the importance of the war can easily be gauged from a consideration of the facts set forth. So far as general consumption is concerned, each week sees a lessening in the business done. Labour scarcity is reported in all directions, while copper is practically too dear to be used for anything other than munition requirements, where expense is a factor which never enters into consideration. How far the upward movement may be carried is a mere matter of conjecture, but it may be said that there is not the slightest sign, so far, of any relief coming to the situation. No doubt, if there were any sign of peace there would be a sharp break in prices, but it is by no means a foregone conclusion that the termination of hostilities and the resumption of normal national conditions in Europe would produce a permanent lowering of prices, for the accumulated demands of the warring nations, to say nothing of the necessity of making good the hundreds of millions sterling of damage, might quite easily keep copper for an indefinite period upon a higher plane than has been seen within living memory.

ELECTRIC COOKING AT EUSTON STATION.

In connection with the handsome new dining-room which has recently been opened by the London and North-Western Railway Co. at Euston Station, advantage has been taken of the opportunity to install a modern, and indeed model, system of electric cooking, in substitution for the previous

cooking arrangements which involved the use of steam and gas-heated apparatus.

The complete electrical equipment has been supplied by the Brompton and Kensington Accessories Co., and is installed in a basement kitchen, and servery and grill adjoining the dining-room. The kitchen equipment comprises four ovens, each measuring internally 2 ft. by 2 ft. by 2 ft. 6 in. high, with the heating elements arranged

INTERIOR OF ELECTRIC KITCHEN, EUSTON STATION, SHOWING OVENS, HAM BOILERS, &c.

LARGE BOILING TABLE, EUSTON STATION ELECTRIC KITCHEN.

around the sides and back. Seven different heats are provided, controlled through two three-way Diamond H switches, with pilot lights, in which the bulbs are enclosed in metal spinnings to safeguard against breakages, and Zed fuses—accessories of this type being used throughout the equipment. Above the oven range is a hot closet, with a maximum loading of 3 kw. controlled by two single-pole switches, and the total loading of the oven range is 23 kw.

Adjoining the oven range are two ham-boilers, each of 30 gallons capacity taking about eight average-size hams, together these have a loading of 7.5 kw., and adjoining this apparatus is a double grill for kitchen use, both apparatus being provided with heat regulation, and the latter—with 7 kw. loading—having four push-and-pull switches, with fuses and pilot lights. In the centre of the kitchen is what forms, in more senses than one, the technical *pièce de résistance* of the equipment—a large boiling table equipped with 23 hot plates of from 2,000 to 1,200 watts maximum loading, giving a total loading of 38.6 kw. Each plate is provided with a three-heat regulation switch, fuse and pilot light, these accessories being arranged round the frame of the top plate. A bain-marie, arranged in two sections with 1,500 watts, maximum loading, a hot closet for 1,000 plates with two-heat regulation and a loading of 3.7 kw., and a vegetable steamer with six nests, and a 4.5-kw. loading with three-heat regulation, are also installed; while adjacent to the service lifts in the entrance, which communicate with the servery above, is a small hot closet, of 2.3-kw. loading, for keeping the food warm while *en route* to the servery. The service lifts are of the Waygood automatic type, with push-button control.

In the servery—which is, of course, close to the dining-room—there is, adjacent to the lift, a vegetable server with a 4.2-kw. loading and two heats to each compartment; the top plate of this server is arranged for the reception of two nests or upper sections of the vegetable steamer, which are

lation, fresh air being introduced and used air exhausted through special trunking, while the kitchen is tiled and finished in white, and electrically lighted throughout. In fact, one cannot help the reflection that such an excellent example of modern hygienic cooking methods should not be hidden from the public view, and that both the company and the public would be gainers were it allowed to advertise itself directly, as well as indirectly, by the excellent cooking results which, we understand, are being obtained. It may be mentioned that each apparatus is on a separate fused circuit and each circuit is led through a meter with a view to obtaining complete cost records.

The total number of meals served at present per day is about 400; the equipment has a total loading of 130 kw. The work has been carried out under the supervision of Lieut.-Colonel Cortez-Leigh, T.D., R.E., chief electrical engineer to the L. and N.-W. Ry. Co., to the requirements of the Hotel Department.

DIRECT-CURRENT MOTOR MAINTENANCE.

By S. LEESE.

(Continued from Vol. 77, page 838.)

The box type of brush-holder has now almost completely ousted the hinged-arm or the grip type which was so prevalent a few years ago. The grip-holder, when constructed properly, with due regard to its right application, makes a thoroughly good and satisfactory brush clip; the box type, however, possesses peculiar advantages which render this form more suitable for use on modern multipolar motors. The smaller amount of circumferential space occupied by the box-holder affords greater protection against the detrimental effects of "flash-over." And with a tendency ever towards economy, especially in the direction of cubical dimensions, the commutator end, particularly in the small-powered machines, becomes a detail of extremely restricted dimensions, and consequently, the short-pitched brush gear, practically unavoidable under such circumstances, gets uncomfortably crowded. Hence, faults which become manifest in "flashing-over" invariably play havoc with the brush-gear. It is possible, and moreover, by no means a rare occurrence, for a "flash-over" to maintain an arc sufficiently destructive in effect to wreck the brush-holders—the circuit fuses remaining intact, although not under-rated. The complication of detail so common in brush-holders of only a few years ago has gradually disappeared, and the absence of "knock-off" catches has rendered the present-day box-type holder a very simple affair by comparison with its earlier prototypes. The helical spring, too, has given way to some

modification or other of volute spring of ribbon section; and by suitably shaping the free end of the spring to correspond to the brush head, auxiliary triggers are dispensed with. Given a sufficient number of convolutions in the spring, tension adjusting gear is unnecessary, as the pressure exerted at the free extremity of the spring is practically uniform throughout the comparatively small range of travel required for nearly all, if not all, commercial brushes.

Many manufacturers have adopted this construction as a standard type, using the same size of holder in multiple as required. Some little time back two well-known makers had turned out quite a number of big machines fitted with this type of brush-holder for tramway traction service. In both cases under review the brush-gear was of unusually massive build, but an unforeseen weak point pretty nearly caused the condemnation of the whole brush-gear. This circumstance came about as follows: The position of the brush-spring normally stood out considerably proud of the body of the holder casting, as will be seen on reference to

VIEW IN THE SERVERY, SHOWING CARVING TABLE AND VEGETABLE SERVER.

transferred direct with their cooked contents to it, preparatory to serving. Two soup tureens kept hot by means of water baths are also fitted; the heat regulation is controlled by six push-and-pull switches.

The servery also contains a large carving table with five cutting dishes for joints and other sundries; an electrically heated shelf behind enables plates and food to be kept hot while waiting delivery, and hot cupboards are also provided below the table for keeping food warm.

The total loading of this apparatus is 10 kw. and heat regulation by means of six single-pole switches is provided.

Yet another piece of apparatus has been installed—viz., the dining room electric grill, which, as usual, is adjacent to, and visible from, the dining room. This has two grilling compartments, with hot closets above and below, and has a 12.5-kw. loading. The switches in this case are of the push and pull type. It will be seen that the equipment is a very complete one in every way, and the kitchen is in many respects a model one, being provided with mechanical venti-

fig. 8. Obviously, under the abnormal conditions inseparable from traction operation, the effects of "flashing-over" would be more concentrated on the outside turns (α) of the spring than on any other part, and so it proved. Spring renewals became of rather too frequent occurrence, and there was always the added danger of a severed spring uncoiling and coming in contact with the commutator many bars behind

FIG. 8.

the same line of brushes. The writer has good reason for citing this case, as he had the "pleasure" of rehabilitating a number of installations of machines afflicted with the trouble described. An effective expedient for protecting brush-gear, especially the weaker and more exposed details thereof, is to shield the holder with a guard made of vulcanised fibre (sheet), one method of application being represented at α in fig. 9.

As an external protective agency the employment of vulcanised fibre finds many useful applications in the operation of electrical machinery. A prolific source of breakdown is

FIG. 9.

that arising from the failure of field-coil connecting wires. In practically all makes of machines, especially of motors, the conventional short tag of wire is used. Sometimes in the winding of the spool a finishing turn of heavier gauge wire is used for strength, but invariably the frail tag end issues at a point more or less inconvenient for connection with the adjacent coil. After the usual servings of spirit varnish the insulation becomes so brittle that great care is required in handling to avoid breaking off the said tag end of wire, which would, of course, necessitate unwrapping the coil covering before repair could be made. There are very few firms indeed that fit a really sound and mechanically safe

FIG. 10.

terminal attachment for field-coils. Two neat devices for this purpose are shown in figs. 10 and 11. As a safeguard against accidental breakage or damage to the connecting

wires, a good plan is to protect the leads by a length of fibre tubing, as represented at a in fig. 11. Fibre tubing may also be used with advantage on the terminal ends of brush-leads and similar connections. This addition obviates

FIG. 11.

the unsightly mess of a matted bunch of greasy dishevelled braiding or flabby overgrown heap of decomposing rubber, and, moreover, makes for greater safety. The desirable neatness too of the finish given to such connections is obvious on reference to fig. 12.

Regarding carbon brushes, the writer asserts deliberately that practically all the troubles arising therefrom are caused either directly or indirectly through insufficient discrimination being made in their selection for the various classes of duty. There can be no excuse (except perhaps, economy) for using unsuitable brushes, as any reputable maker can supply carbon brushes graded to fit every known condition of working. What is commonly known as blackening of commutators is a condition which can be usually corrected by a suitable change of brushes. There is a growing tendency toward the wider use of plain or metal-capped brushes without bonding strips or cords, especially for low-powered motors. This cannot be looked upon as other than a retrograde step, as even if a number of brushes of the same design are used, the absence of any

FIG. 12.

properly defined path for the brush current leads to all manner of trouble, and the inevitable heating which is set up destroys the tension spring, and insidiously weakens the holder at some slim part or other, such as rivet, pin, screw, &c. Greater tension, too, is required to ensure sufficient contact between the spring member and the brush; obviously, the life of the brush is considerably reduced thereby. For bonded brushes, probably the best method of amalgamating the flexible copper member with the carbon mass is to employ some binding medium which allows of the connection being made while the brush is in the plastic stage. The common method of soldering the bond to a metal cap or pin is unreliable, and the use of screw-clips and claws is equally bad, as, in addition, the practice renders a large proportion of the brush unusable. This detail is admittedly a weak point. There can be no excuse, however, for the existence of the many wretched devices which are to be seen at the other extremity of the brush-bond. For instance, the brushes of a certain standard 1,000-kw. machine were fitted with bonding cords which terminated in toy-like thimbles secured by $\frac{1}{8}$ in. Whitworth screws, the tapped hole in the thimble socket being insufficient in section to carry even a couple of full threads. The employment of separately attached terminals or thimbles

is bad and quite unnecessary, as suitable eyelets may be formed easily on the flexible bond itself by pressing or welding. Of the various methods in vogue for securing the eyelet end of the bond to the brush-holder or its spindle very few can be described as good, some are indifferent, the majority distinctly bad. Naturally, the ordinary threaded screw is largely used, and if due regard be paid to proper proportions, this method of making the connection provides a secure and efficient fastening. But one might, not altogether unreasonably, wish for a more facile and dignified way of securing a refractory brush-bond on a bottom set of brushes of a 1,000-KW. generator, than by means of a No. 5 B.A. round-head screw, the operator lying face upward with spinal column at a most unnatural angle. For this purpose such ridiculously small screws are altogether out of place; nothing smaller than a $\frac{3}{8}$ -in. Whitworth, or equivalent thread, should ever be used, and loose washers should be avoided always. A good form of screw is shown at fig. 13. The type of pin plug (fig. 14) is used on some makes of motors, various kinds of socket being available; in one form a spring clip is attached to the brush-holder by means of screws, in others an extension of the holder itself is made to form a socket into which the said pin is introduced. To be really efficient a pin-plug for this kind of duty should have a bifurcated shank and be brazed or

FIG. 13.

FIG. 14.

FIG. 15.

welded to the flexible tape or cord, and fit into a correctly-drilled socket, one form of this attachment being shown at fig. 15. The shoulder at *a* is to prevent the pin from touching the commutator, as it not infrequently happens that the careless replacing of a brush-bond results in a badly-grooved commutator, when the connecting pin is unshouldered. Some makes of brushes are fitted with bonds of inordinate length, especially for the smaller sized motors; great care should, therefore, be exercised in fitting so as to avoid making accidental contact with the motor case, or fouling the brush tension spring or trigger. The writer has experience of many cases where unnecessarily long brush-leads have become welded to the motor frame, causing considerable damage and inconvenience, through being disturbed during cleaning operations.

Another fruitful source of trouble is the failure of the external insulation at the commutator end clamp-ring, as indicated at *a*, fig. 16. Usually, the breakdown is not primarily due to inherent defects or flaws in the insulation

FIG. 16.

itself, but rather is the resultant effect of the time-honoured practice of binding with string or twine. The inconsistent practice of covering a fairly wide space of mica or micanite with cotton or hemp banding is really ridiculous. To argue that a serving of shellac solution is afterwards applied only aggravates matters, as the inevitable shrinkage that takes place renders the banding brittle and easily severed; moreover, the interstices between the several turns afford lodging places for dirt and grease. Farther, to re-string an unwound band *in situ* is not an amateur's job, even were such a course recommendable, which it is not. This practice, still widely persisted in, is bad, mechanically and electrically,

and it would seem, surely, that some better form of finish should not be beyond the resources of the progressive manufacturer. A satisfactory method was employed by one of the pioneer firms for a good many years, on fairly high-voltage machines.

The practice of "grooving" commutator bar insulation as a panacea for sparking troubles has enjoyed a very short-lived vogue, and perhaps rightly so. Doubtless, many cases of sparking have become amenable to some modification or other of this kind of treatment, but its application as a cure-all savours somewhat of the "tall order." Endless expedients have been devised and used with more or less success in the amelioration of sparking arising from external causes, and every plant attendant will have faith in his own particular pet palliative for administration in refractory cases. One might wish there were fewer proprietary nostrums on the market, as such so-called commutator compositions do more harm than good in ignorant hands, and it is by such that these substances are mostly used. Purely external sparking can be invariably traced to some well-defined cause or other, and when shorn of the profound mystification which usually surrounds the diagnosis of such affections, the disturbing factor oftener than not proves to be of an almost ridiculously simple character.

Given fair treatment a commutator will run for a surprisingly long time, even when it has become worn considerably out of truth. It is a mistake, however, unduly to

FIG. 17.

overrun a machine when in such a state. The best policy always in such circumstances is to have the commutator properly trued up before the inevitable mishap occurs. Of the two methods available—turning and grinding, it is pretty safe to say that neither has much, if any, advantage as regards the finished job over the other, all things else being equal. The turning of commutator metals demands the services of the skilled turner experienced on this particular class of work. On the other hand, a satisfactory job may be made by an unskilled hand (that is to say, one inexperienced at turning) with a good grinding machine. This is rendered possible by the employment of devices hitherto found only on the more expensive and fixed machine tools. Control of feeds and speeds is now obtained with micrometer-like precision, and the possibility of over-running is eliminated by automatic reversing and stop-gear motion. One great advantage of the modern commutator grinder is that the commutator which is being operated upon also drives the grinder, usually by means of friction gear. With the older types of grinding machine the necessity for some external source of driving agent often added to the difficulties of overhauling a commutator. Of course, there are limits to the application of grinding *in situ*, especially in small sizes of motors—say, 20 H.P. and downwards. Improved methods of design and manufacture have rendered the withdrawal of an armature quite a simple matter, and no special appliances are necessary for its subsequent insertion between lathe centres. Once it is properly chucked, the actual work of turning up the commutator is performed with less expenditure of labour and time than if grinding were resorted to. When truing a commutator by turning, light cuts only should be taken, especially at the start, as the bulk of the cutting is on white stock, and mica quickly turns the edge of the tool. Heavy cuts, too,

have a tendency to spring the commutator bars and open the mica, thus presenting openings for the entry of metal dust and chips. A good average cutting speed is 90 to 100 ft. per minute, using a sharp V tool having slight *top rake* and set at centre of work. A good finish is obtained with "medium" and "fine" carborundum cloth. To prevent the lodging of cuttings between the commutator connections a stiff paper covering should be previously attached in a suitable manner. The practice of swathing the armature winding at this part in canvas wrapping has much to recommend it, and has, in fact, been adopted by a few makers. Instead of the conventional rope sling commonly used for lifting armatures, a form of cradle, as shown at fig. 17 is better, as, with the latter, risk of damage to winding, commutator, &c., is practically non-existent. The writer has had the pattern illustrated made up of a suitable size of Gandy belting with patch eyelets as shown, for handling armatures up to 6 tons in weight.

The fitting of new brushes is an operation far too casually treated; so also the re-bedding of the whole of the brushes after skimming up the commutator is often neglected. Obviously, owing to the reduced diameter of the commutator, the brush face and commutator surface will not coincide. The initial correct shaping of the brush face is of the utmost importance, and new brushes should never be left to shape on the commutator unassisted; neglect of this measure results in scorching and discoloration of the commutator surface, which then requires restoration.

(To be continued.)

SOUTH AFRICAN MUNICIPAL ELECTRICAL ENGINEERS IN CONGRESS.

THE first annual Congress of the Association of Municipal Electrical Engineers (Union of South Africa) was held in Johannesburg, commencing on Monday, November 15th, and terminating on Saturday, November 20th, 1915. There were present the undermentioned municipal electrical engineers:—

M. McDonough, Bethlehem.
W. F. Long, Cape Town.
G. H. Swingler, Cape Town.
J. Roberts, Durban.
E. Poole, Durban.
J. H. Blatchford, Greytown.
J. R. English, Heilbron.
T. Miller, Harrismith.
J. H. Dobson, Johannesburg.
F. T. Stokes, Johannesburg.
E. T. Price, Johannesburg.
T. Jagger, Ladysmith.

T. C. Wolley-Dod, Pretoria.
B. Sankey, Port Elizabeth.
A. S. Munro, Pietermaritzburg.
F. Castle, Oudtshoorn.
N. D. Ross, Potchefstroom.
W. Bellad-Ellis, Queenstown.
R. Mortimer, Rodepoort.
W. Leonard, Standerton.
— Ward, Newcastle.
L. L. Horroll, Pretoria.
L. B. Proctor, Boksburg.
W. S. Guildford, Boksburg.

On Monday the delegates were welcomed by the Mayor (Mr. Norman Anstey) and the chairman of the Tramway and Lighting Committee (Councillor T. F. Allen). Prof. J. H. Dobson, general manager, Gas, Electric Supply and Tramways Department, Johannesburg Municipality, was unanimously elected President for the year, and in the afternoon the members visited the Rosherville power station of the Victoria Falls and Transvaal Power Co., returning to Johannesburg at 6 p.m.

On Tuesday morning the delegates visited the Crown mines, and were received by the general manager, Mr. A. J. Brett, and the underground manager, Mr. Simpson. The party went down the mine, visited the large underground electric pumping plant, and afterwards inspected the surface plant. In the afternoon, the President, Prof. J. H. Dobson, delivered his inaugural address, and was accorded a hearty vote of thanks by Messrs. T. C. Wolley-Dod, of Pretoria, and B. Sankey, of Port Elizabeth. Mr. W. F. Long, city electrical engineer of Cape Town, read a short paper, entitled "Some Notes on the Prevention of Corrosion in Condenser Tubes," and a lengthy discussion followed.

On Wednesday the Congress met at 10 a.m. at the Town Hall, and after informal business, Mr. John Roberts, borough electrical engineer, Durban, read a paper on "Tariffs of Prices for Electricity," which was fully discussed. In the afternoon the delegates visited the power station of the Randfontein Estates and Gold Mining Co., being welcomed at the mine by Mr. T. P. E. Butt, the chief electrical engineer to the company.

Next morning a paper on "Diesel Engines" was read by Mr. W. Bellad-Ellis, borough electrical engineer, Queens-

[Johannesburg.]

A GROUP OF THE DELEGATES AT THE CONFERENCE OF THE MUNICIPAL ELECTRICAL ENGINEERS OF SOUTH AFRICA,
Held at Johannesburg (S.A.).

BACK ROW.—M. McDonough, Bethlehem; J. R. English, Heilbron; T. Jagger, Ladysmith; T. Miller, Harrismith; J. Roberts, Durban (Member of Council); T. C. Wolley-Dod, Pretoria; B. Sankey, Port Elizabeth (Member of Council); E. T. Price, Johannesburg (Hon. Treasurer); F. Castle, Oudtshoorn; G. H. Swingler, Cape Town.
BOTTOM ROW.—W. Bellad-Ellis, Queenstown (Member of Council); F. T. Stokes, Johannesburg (Hon. Secretary); W. F. Long, Cape Town (Vice-President); J. H. Dobson, Johannesburg (President); A. S. Munro, Pietermaritzburg; W. H. Blatchford, Greytown; E. Poole, Durban.
(Names reading left to right.)

town, and after discussion the members visited the various places of interest in the town; in the evening they were the guests of the S.A. Institute of Electrical Engineers at the Transvaal School of Mines and Technology, when Prof. J. H. Dobson read a paper entitled "The Distribution Plant of the Johannesburg Municipal Electric Supply System," receiving a hearty vote of thanks from the Council of the Institution for his valuable paper.

On Friday, further discussions on the papers read during the week took place, and in the afternoon the Johannesburg municipal power station and distribution system were visited, also the large municipal abattoirs.

The Congress was brought to a conclusion on the following day, Saturday, when informal business was transacted, and the additional officers and Council were elected for the ensuing year, making the complete list as follows:—President, J. H. Dobson; vice-presidents, W. F. Long, B. Sankey, John Roberts, W. Bellad-Ellis; hon. secretary, F. T. Stokes; hon. treasurer, E. T. Price.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

An Expansible Boring Cutter.

MESSRS. VISLOK, LTD., of 2, St. Bride's House, Salisbury Square E.C., have recently placed on the market a new patented adjustable double-ended cutter for finishing holes in boring work, which is known as the "Gauge-all." The new cutter consists of two high-speed tool steel ends connected at the centre by special soft metal alloy. When, after the usual wear, it is necessary to increase the length of the cutter to its original dimensions, this is achieved by lightly hammering the alloy centre, which, being compressed,

FIG. 1.—METHOD OF EXPANDING CUTTER.

forces out the steel ends. A U-shape iron or brass clip is placed round the alloy centre in order to facilitate the operation, and it will be noted that as the machine-man himself does this work, frequent visits to the tool room are dispensed with. A "Gauge-all" cutter with one centre has finished 200 holes, 3 in. by 10 in., in steel castings, and as new centres can be put in by the makers,

FIG. 2.—CUTTER, SHOWING ALLOY CENTRE.

its life can be still further prolonged. The ordinary cutter after about three visits to the toolsmith, has lost its nature, and therefore the new tool represents a great saving of tool steel—an indispensable commodity at the present time—and time, which is

FIG. 3.—"GAUGE-ALL" CUTTER EXPANDED.

always costly. We understand that the "Gauge-all" cutter has been thoroughly tested for a long time, mainly on steel castings, with most satisfactory results, and that in practice it has proved as stiff under a heavy cut as a solid steel cutter.

"Witton" Motor Starters and Controllers.

THE GENERAL ELECTRIC CO., LTD., of 67, Queen Victoria Street, E.C., has recently issued a new illustrated catalogue—"V section supplement"—dealing particularly with the numerous types of motor starters and controllers constructed by the company, which it is prepared to deliver either from stock or at short notice.

All kinds of "Witton" open, enclosed or semi-enclosed D.C. starters are stocked; this also applies to plain A.C. motor starters. These motor starters comprise adjustable three-phase resistances, without any automatic features, mounted somewhat similarly to those used in standard D.C. starters. The resistances are adjusted to pass approximately full load current on the first contact and thus to start motors against full load torque. "Off" contacts are provided. A spring return and "on" catch may also be provided at a slightly increased price.

For starting three-phase squirrel-cage motors against loads not exceeding half full-load torque, "Witton" star-delta drum type

FIG. 4.—"WITTON" MISTAKE-PROOF AUTO-TRANSFORMER STARTER.

starters are to be recommended. These starters are suitable for motors taking a line current up to 50 amperes at 550 volts, three-phase. The "starting," "running" and "off" positions follow one another consecutively, so that it is impossible to go from the "off" to the "running" position without passing the "starting" stop.

Where squirrel-cage motors have to start against a greater torque than half full load torque, an auto-transformer starter should be employed; these starters comprise an auto-transformer with tapplings giving a voltage of 40, 60, 70 and 80 per cent.

FIG. 5.—"WITTON" LIQUID STARTER FOR USE IN MINES, FLOUR MILLS, CEMENT WORKS OR DUST-LADEN ATMOSPHERES.

of the full line voltage, together with a change-over switch, operated by an external handle. The transformer can be oil-immersed if desired.

The well-known "Witton" liquid starter for continuous or alternating current motors is also listed, and we understand arrangements have been made to hold a large stock of finished parts to facilitate quick delivery.

In the case of extensions to existing motor equipment or new motor equipment in improvised factories and workshops, the "dockyard" and "factory" types of motor-starting panels are especially suitable. These panels consist of a Salford switch and fuse (two-pole for D.C. and three-pole for A.C.), one ammeter, totally enclosed in the dockyard and open in the factory type, and one D.C. or star-delta starter, totally enclosed in the dockyard

FIG. 6.—FACTORY TYPE MOTOR STARTING PANEL WITH DOOR OPEN, SHOWING FUSES.

and semi-enclosed in the factory type. The panel is simply bolted in position on site and connected to the motor by leads in the usual way.

For the control of small cranes and in other situations where space is limited, "Witton" 1 A.R. size controllers are suitable.

In addition to the foregoing, other controllers and controller resistances are listed, as are automatic motor starters, ironclad reversing switches, shunt regulators, main regulators, multiple switch starters, single-phase motor starters, &c.

Horn-Gap Fuses.

In the *Electrical World* for December 11th, Mr. E. A. Dillard describes methods which he has found satisfactory for the protection of small sub-stations against overload and breakdown of apparatus with high-pressure fuses. He prefers annealed copper wire for the fusible metal, though other metals would serve, and has found it easy to calculate the time in which a fuse will blow under given conditions, but not so easy to ensure the speedy clearing of the arc that follows.

The best shape of horn was found experimentally; straight horns like portions of the letter V were not so good as horns

FIG. 7.—HORN-GAP FUSE.

curved as in the accompanying figure, which shows the horn-gap fuses used on overhead circuits at 22,000 volts; with these horns the arc was opened in half the time required with horns of other shapes.

The horns were made of galvanised-iron pipe, provided with clamping bolts at the base for the fuse wire, which was also

wrapped round the horns, but enclosed fuses were found more satisfactory, the fuse-wire being enclosed in a fibre tube surrounded with a glass tube capped at one end with a heavy brass terminal. On fusion taking place, the arc vapours are violently expelled from the open end of the tube, and the arc is quickly broken without damage to the holder.

Electric Hot-Pad.

The HOTPOINT ELECTRIC HEATING CO., of 38, Poland Street, Oxford Street, W., have introduced a new flexible metal hot-pad—the "El Comfo"—constructed of nickel-plated metal with a removable eiderdown cover, and sufficiently flexible as a whole to bind round an arm or leg or fit to the shape of the body.

A special feature is the provision for temperature regulation. An even temperature can be maintained between 100° and 200° by

FIG. 8.—"EL COMFO" FLEXIBLE HOT-PAD.

means of a thermostatic cut-out arranged inside the apparatus, while the temperature limit is fixed by a small switch lever at one end of the device. It is claimed that owing to the automatic heat control, some five hours' service can be obtained for 1d. The

FIG. 9.—ALUMINIUM HOT-PAD.

apparatus is supplied with 4 ft. of specially reinforced flexible to connect to 6 ft. of ordinary cord and measures 10½ in. by 6½ in. by ½ in. thick.

A non-flexible aluminium hot-pad is also supplied of circular disk pattern, with one side convex and the other concave to suit body curves. The temperature arrangements and covering are similar to the preceding type; the apparatus is 8 in. in diameter and weighs 1 lb. The heating elements are guaranteed for two years for the flexible and for five years for the non-flexible type.

Japanese Electro-chemical Works.—H.M. Vice-Consul at Osaka reports that a company has been formed in Osaka, with a capital of 350,000 yen (about £35,700 at par), for the manufacture of caustic soda by the electrolytic process, and is going to erect a factory in Kyushu, where hydro-electric power is fairly cheap. The machinery is to be Japanese. As a by-product bleaching powder will be obtained, and an output of 300,000 lb. of caustic soda per month is spoken of.

Renumbering of Patent Specifications.—The Patent Office announces that in order to give the public the advantage of having abridgments of specifications up to date while retaining their numerical sequence, applications for patents made subsequent to 1915 will be given new numbers when their complete specifications are accepted, or become open to public inspection before acceptance. The new numbers will start with No. 100,001 (without any indication of date), and will supersede the original application numbers in all proceedings after acceptance or publication of the complete specifications. It is intended in future to issue abridgments of specifications in the illustrated official *Journal* a few weeks later than that in which their acceptance or publication is advertised, so that they will be available for search purposes soon after the printed copies of the specifications are on sale; but, until the system is fully in force, they will only be issued when there are sufficient to make up a full sheet of 16 pages. The present series of abridgments will run concurrently with the new series in the *Journal* until April, 1917, when it will be entirely superseded.

THE IGNITION OF EXPLOSIVE GAS MIXTURES BY ELECTRIC SPARKS.

By J. D. MORGAN, A.M.I.E.E.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS at Birmingham, December 18th, 1915.)

The ignition of an explosive gas mixture by a spark is commonly considered to depend upon the communication of heat from the spark to the gas. When approaching the subject it is natural to suppose that the ability of the spark to ignite the gas can be expressed in terms of the heat energy of the spark. On examining the subject experimentally, however, a suspicion is soon created that ignition depends partly, if not entirely, upon some cause other than heat.

Assuming that heat alone when accompanied by sufficient temperature is capable of causing ignition, it would apparently be right to suppose that the mode of producing electric sparks containing sufficient heat could have no effect upon the igniting property of such sparks. This, however, is not found to be the case.

Prof. Thornton has shown that a greater amount of energy is required to produce an igniting spark by an alternating

FIG. 1.

current than by a continuous current; and the relationship between the number of volts and amperes in the circuits immediately prior to the production of the sparks differs in character in the two cases. This fact is in itself sufficient to prompt the question: Does ignition depend upon some factor other than heat? A variety of experiments suggest a reply. If an iron wire heated by an electric current (continuous) be held over the disk of a charged electroscope, it will be found that when the wire first becomes visibly hot there is no effect upon the electroscope and gas cannot be ignited. On gradually increasing the current a condition of temperature is attained at which the electroscope steadily discharges. It is at this temperature that ignition occurs. Mr. J. R. Thompson has found that it is possible to ignite a cold explosive mixture by the incidence of X-rays on a platinum surface in it.

Where a hot wire or spark is the source, ignition only occurs when ionisation is produced, and ionisation alone without heat has been found to be capable of causing ignition.

FIG. 2.

Ionisation accompanies the common electrical methods of ignition.

It is well known that gas mixtures are only combustible when the proportions lie within certain limits. These limits, for methane and air, have been carefully worked out by Dr. Wheeler, and the least single igniting spark for mixtures between these limits has been investigated by both Wheeler and Thornton. Mixtures of methane and air containing less than 5.6 per cent., and more than 14.8 per cent., of methane are incapable of ignition. The most sensitive mixtures lie between 7.5 per cent. and 9 per cent. of methane.

A common method of defining the least spark which will ignite a given gas mixture is by specifying the number of volts and amperes, or the number of amperes and the inductance in the circuit prior to the formation of the spark. On the assumption that this gives a measure of the ability of a spark to ignite a gas (or the "incendivity" of the spark), the validity of the method has been rightly questioned. For both inductive and non-inductive circuits there seems to be

no sufficient reason, as will be explained later, for the assumption that the energy associated with a circuit prior to sparking can be regarded as a measure of the incendivity of the spark. Nevertheless, there is a practical value in curves showing the relationship between the number of volts and amperes or amperes and inductance in circuits which when broken give rise to sparks capable of igniting a given gas mixture, for they indicate conveniently the practical conditions under which dangerous sparking becomes possible.

The character of the alternating-current curves is different from those for continuous current, and for a given voltage the amount of the current is always higher. Fig. 1 shows how at a fixed voltage (90 volts) the least current capable of producing an igniting spark in an 8 per cent. mixture of methane and air varies with the inductance of the circuit. It is interesting to note that in an inductive circuit at relatively low voltages the current varies but little over a wide range of voltage variation. An example is shown in fig. 2. A similar condition is found in fig. 4. The curves given in figs. 1 and 2 show that the amounts of voltage and current, or current and inductance, capable of producing dangerous sparking are comparatively small, and emphasise the necessity, already well known, of adequately safeguarding electrical apparatus to which explosive gases are accessible.

The experiments upon which the curves in figs. 1 and 2 depend were performed with the aid of single sparks. The author finds that a single spark, which when repeated slowly will not ignite a gas, will after a more or less definite interval produce ignition when repeated rapidly. The element of time seems to him to be a factor of importance in ignition phenomena. If, instead of a single break device, a vibratory make-and-break device (such as the trembler of a bell) be employed, it is found that the ability of a given spark to ignite a gas mixture depends upon the duration of the sparking as well as upon the circuit conditions recorded in the investigations above described.

Fig. 3 shows a typical result following the use of a trembler spark in an explosive atmosphere consisting of a 10 per cent. mixture of coal-gas and air. The current was approximately 0.4 ampere throughout the range of the experiment. At 9 volts ignition was obtained instantly. On reducing the volt-

FIG. 3.

age to 7 a single break-spark would not ignite the gas, even when repeated as rapidly as hand-manipulation would permit; but when the trembler was allowed to vibrate normally, ignition due to the trembler spark occurred after one second. At 5 volts ignition occurred after ten seconds. This fact appears to be of practical importance in connection with that system of bell signalling commonly used in mines, in which the circuit is closed by the application of a piece of iron to a pair of bare wires. Sometimes an old file or a knife is used, and whatever be the implement employed the surface is usually rough. In drawing this implement across the wires there is not obtained the single spark of carefully maintained laboratory apparatus, but a rapid succession of sparks approximating to that of the trembler.

Reverting now to the question whether the measure of the circuit volts and amperes, or amperes and inductance, can be regarded as a measure of the incendivity of the spark, Prof. Thornton has stated that the energy of a break-flash (referred to sometimes in this paper as a single spark) is proportional to the power of the circuit and is equal to $\frac{1}{2} L i^2$, where i is the circuit current. In a recent leading article, the ELECTRICAL REVIEW* has gone a step further. Arguing from Prof. Thornton's work and basing its calculations specifically on certain curves by Dr. Wheeler (of which fig. 1 is one), it is stated that the igniting power of a break-flash depends on the $L i^{3/2}$, or approximately the $L i^{3/2}$, of the circuit. Finally, it is stated that for every gaseous mixture there is a constant value of the product $L i^{3/2}$ beyond which the break-flash will be capable of igniting the mixture. This is an interesting deduction, but the truth does not seem to be expressible in such a simple form. Igniting sparks can be produced in practically inductanceless circuits carrying but a few amperes. These sparks, which may be termed "hot-point" sparks, are not included in an expression based on inductance.

When a pair of contact points in a non-inductive circuit are separated so that an arc is maintained between them, it is true that the product vi is a measure of the power of the arc. The value of v is not necessarily the same during arcing as when the contacts are together, and there is no reason for assuming them to be the same when the arc is only of momentary duration. Therefore vi prior to sparking is not a measure of the power of a hot-point spark. Further, in non-inductive circuits carrying the same power, both igniting and non-igniting sparks can be produced by simply altering the shape or material of the contacts. Again, when the circuit is inductive and the above effect does not enter or is negligible, then the energy which produces the spark on separating the contacts is expressed by Li^2 . With the same energy either igniting or non-igniting sparks may be produced according to the shape or material of the sparking points.

As already indicated, curves connecting volts and amperes, or amperes and inductance, in the circuit are useful as giving a general idea of the magnitudes involved in the production of igniting sparks, but caution must be exercised in using them, since (1) a variation of the size or material of the sparking points is attended by an alteration of the value of the circuit current required to produce an igniting spark, and (2) the incendency of a spark depends to some extent upon its duration.

The general conclusion to which the author has been led by a variety of experiments on the electrical ignition of gases is that it is necessary to distinguish between the energy which produces a spark and that quality of the spark termed by him "incendency," which enables the spark to cause ignition, and that the magnitude of the one is not a measure of the other, although there may be a more or less regular relation between them when certain physical conditions are kept constant. Ignition seems to depend on the ionisation caused by the spark. During the interval of sparking the ionisation may be rapidly dissipated or neutralised. If the neutralising action predominates there is no ignition of a gas mixture. If there is little or no neutralising action, ignition occurs immediately. Between these two limits there are a variety of intermediate conditions, which apparently account

FIG. 4.

for the delay of ignition indicated by fig. 3, and much of the great irregularity that is often experienced in experimental work on this subject.

Enclosed Apparatus.—The effect on an explosion of the shape of the gas containing-chamber is not sufficient to be of any practical importance in the design of a case. However, if the shape is such that the case virtually comprises two or more communicating compartments, then an explosion initiated in one of them might spread to and produce destructive effects in the other; and a given gas mixture which explodes harmlessly in a motor case when the armature is at rest might explode with sufficient violence to wreck the case when the armature is in motion. These phenomena are quite well known in connection with the study of gas explosions. The increased pressure in the first is due to turbulence prior to ignition, and in the second is due to turbulence. In the design of protective cases for electrical apparatus it is necessary (1) to avoid intercommunicating chambers or chambers with partitions so arranged that it is possible for an explosion in one chamber to compress the gas in the other before igniting it, and (2) to construct the case so that it will withstand the increased explosion pressure due to turbulence. A motor which successfully resisted an internal gas explosion when at rest had its cover blown off by an explosion when the motor was in motion. At first sight this does not appear to agree with what is known of turbulence effects; but the explanation is probably that when an explosion occurs in a chamber in which the cooling surface is relatively large, turbulence may produce not only an increased rate of explosion but also an increased maximum pressure. A further fact which might have a practical bearing upon the design of covers is the character of the internal surface, if the configuration involves restricted passages. A rough surface has an accelerating effect both in dust and gas explosions, probably due to turbulence. Whether this effect is appreciable in closed chambers does not appear to be definitely known, but in tubes the effect is very marked.

Mine Bell-circuits.—The signal bell-circuits employed in mines commonly comprise a pair of bare wires connected to a trembler bell and battery. A signal is given by connecting the wires with the aid of a metal instrument. The bare-wire system has much to commend it on the score of simplicity and convenience, but latterly it has become the subject of much suspicion, especially since the Senghenydd disaster in 1913. Suggestions have been made to abolish bare-wire circuits and employ enclosed switches arranged at suitable intervals along insulated circuits, but the inconvenience of this is sufficiently evident to make it clear that miners will not abandon the bare-wire system unless it is shown to be irretrievably dangerous. The facts appear to be that the system is not seriously risky and that what risk does exist can easily be removed.

The spark at the trembler of a bell is more dangerous than the single break-spark which occurs on the bare circuit when a signal is given. To avoid the use of a trembler it has been proposed to use single-stroke bells; but the trembler bell is apparently preferred by miners as the liability to mistake in the interpretation of a signal is less with the trembler than the single-stroke bell.

Danger of gas ignition at the trembler has been minimised by the use of an enclosing case, and the risk due to the spark in the external circuit has been tolerated partly for the reasons that such spark is supposed to be comparatively harmless and that the ventilation of the mine is sufficient to prevent the accumulation near the wires of an explosive mixture. Laboratory investigations show that, using a bell of the ordinary type, the break-spark can be not less dangerous than the trembler spark. If it is deemed necessary to enclose the trembler, there is no justification therefore for disregarding the break-spark. The first necessity is to abolish the break-spark or reduce it to a harmless dimension, and the second is to render impossible such a variation of the bell adjustment as would enable a dangerous break-spark to be produced.

The results of tests by the author on a mining bell in an atmosphere of coal-gas are shown in fig. 4. One object was to find the variation of current in the bell circuit with variation of voltage, and the manner in which these variations are affected by alterations of the bell adjustments. The other object was to find with what voltage and current ignition could be obtained both at the trembler and the break or contact in the external circuit. By adjusting the movable contact-screw at the trembler so as to produce the minimum spark-gap when the armature was vibrated by the magnet, and reducing the resistance of the armature controlling-spring to the minimum, the relation of volts and amperes indicated by mg.mt. was found. At 4 volts the current was 0.1 ampere, and at 12 volts the current was 0.2 ampere. Retaining the same tension at the spring and increasing the trembler gap to the maximum, the curve Mg.mt. was obtained. With this adjustment the current is 0.05 ampere at 4 volts and 0.2 ampere at 12 volts. Keeping the gap at the maximum and increasing the spring tension to the maximum at which the bell could be actuated with a pressure of 4 volts, the relationship between volts and amperes is given by the curve Mg.Mt., in which the current rises from 0.1 ampere at 4 volts to 0.3 ampere at 12 volts. Still keeping the maximum tension, but adjusting the gap to the minimum, there was obtained the curve mg.Mt., which varies from 0.2 ampere at 4 volts to 0.4 ampere at 12 volts. A much higher current could be passed through the system by largely increasing the spring tension, but the bell could not then be actuated at a pressure below 9 volts. The result is shown in the short upper curve, which rises from 0.75 ampere at 9 volts to 0.9 ampere at 12 volts.

Repeating the above experiments in order to determine the conditions necessary for ignition of a coal-gas mixture, it was found that in the tests corresponding to the first three curves ignition could be obtained at 6 volts, but not lower; whereas when the spring tension was increased and the gap diminished as above stated, ignition could be obtained at 4 volts. When the gas could be ignited at the trembler spark it could also be ignited (although sometimes only after a number of trials) at the single break-spark. In these tests, therefore, both sparks were equally dangerous. The system which could be made to operate safely below 6 volts could be rendered dangerous by altering the trembler spring.

The above remarks are only true for coal-gas. It may be rather severe to test a mining installation in coal-gas, but if it can stand the coal-gas test it is abundantly safe in methane. An ignition test made by Dr. Wheeler on the above bell showed that with the armature fixed and the trembler contacts touching (a condition which gives the largest break-flash), the least current required to produce an igniting break-flash in an 8 per cent. mixture of methane and air was 0.26 ampere at 25 volts. An oscillogram of the current taken by the bell while ringing has been kindly supplied by Dr. Wheeler and is shown in fig. 5.

To ascertain whether a large reduction in the strength of the magnet coils would reduce the capability of the trembler and break-sparks to ignite coal-gas, a pair of weaker coils was arranged in conjunction with a vibrating armature contained within a small explosion chamber, the armature being controlled by a spiral spring instead of the flat or blade spring usually employed. In all cases the current values are higher and the sequence of the curves is slightly different from that of the bell tests. With minimum gap and minimum tension, ignition was first obtained both at the trembler and the

break at 6 volts. With the other adjustments ignition was obtained at 4 volts. It follows, apparently, that it is useless to reduce the inductance of the circuit to avoid dangerous sparking unless the value attainable by the current is also reduced. In his report Dr. Wheeler remarks upon the desirability of making the resistance as high as possible, and the above experiments support this conclusion.

An obvious deduction from the foregoing is that for safe working the maximum voltage should be kept as low as possible. In the author's opinion, the value permitted by the Home Office regulations, namely, 25 volts, is much too high. Also the internal resistance of the batteries should be high in order to avoid a relatively large current in the event of an accidental short-circuit. Further, some additional precaution should be taken to abolish the spark or to reduce it to negligible dimensions.

A variety of expedients have been devised. One, well known to telegraphic engineers, consists in the arrangement of a non-inductive shunt of comparatively high resistance across the ends of the magnet windings. This diminishes the trembler spark and probably reduces the break-spark. A condenser across the trembler gap improves the conditions at the trembler, but does not remove the danger from the external circuit. Another device consists of a short-circuited winding or layers of tin-foil between the magnet windings for the purpose of reducing the energy available for sparking.

FIG. 5.

at the gap or break. Layers of tin-foil were wound in the magnet windings of the coils used for the tests recorded above, and it was found that whilst they increased the voltage required for ignition at the trembler from 4 to 6 in the Magnet curve, no improvement was found at the break-spark of the external circuit.

An arrangement which has been found to give good results at both the trembler and the break is shown in fig. 6. The action at the trembler is the reverse of the ordinary action.

FIG. 6.

Instead of interrupting the circuit, the trembler short-circuits the magnet. The magnet windings are indicated by *a* and the spring-controlled armature by *b*. One end of the armature is connected to one end of the magnet coils, and the fixed contact *c* is connected to the other end. When the external circuit is closed as indicated diagrammatically at *d*, the magnet is excited and the armature is attracted by the same. Near the end of the movement a spring blade *e* on the armature touches the fixed contact *c* and short-circuits the magnet. By means of its spring the armature is returned, and the parts *c* and *e* are separated. The action is then repeated and a vibratory motion of the armature is obtained, only a very minute spark is produced at the trembler, and this is entirely negligible. The intensity of the single break-spark at *f* is not reduced, however, to the same extent, and although it is much less active than when the ordinary trembler construction is used in the bell, it is possible to produce ignition of an explosive coal-gas mixture.

The mining bell above referred to was converted, without altering the magnet coils, to correspond to fig. 6, and the result of a test is shown by the top line in fig. 4. It will be observed that the current taken by the bell was very considerably larger than that by the normal bell. At 4 volts the current was 1 ampere, and at 12 volts it was 3 amperes. Notwithstanding the relatively large amount of current, no ignition of a coal-gas mixture could be obtained with any voltage at the trembler, but ignition could be obtained with 6 volts at the external break. By suitably proportioning the magnet windings and inserting a resistance between the battery and the bell, the current can be reduced to something of the same order as that required for an ordinary bell, and in that case the external circuit would be rendered quite safe.

Notwithstanding the improvements obtainable by devices such as those above described, the complete solution lies in the author's opinion, in a suitable relay system. By using a small relay arranged to be actuated by a 4-volt battery, he obtained perfect operation of the bell with a current of 0.1

ampere in the relay circuit. Sparking in the external circuit of the relay was quite insignificant, and no ignition of coal-gas could be obtained. It was necessary to increase the relay current to 0.6 ampere before ignition could be produced. At the relay contact the condition was the same as in the external circuit of an ordinary bell, but it is obvious that this could be avoided by the use of a condenser or non-inductive resistance at the relay contact and the employment of a short-circuiting trembler at the bell. A similar experiment to the foregoing was performed by Mr. Watts* with similar results. Under laboratory conditions there is no difficulty in rendering a bell system safe on the lines above indicated, and there appears to be no reason why the same conditions cannot be realised in a practical apparatus suited for mining conditions.

Conclusion.—The opinion has already been expressed above that the Home Office regulations limiting the highest permissible voltage in bell signalling systems to 25 cannot secure safety, as the figure is obviously too high. If it is desirable to fix a limit, the figure should be reduced to 5. With the adoption of a relay system this lower figure is practicable. The fixing of a voltage limit is not, however, sufficient in itself to ensure safety. There should be added the condition that sparks produced in the system should not be capable of igniting a specified mixture of methane and air, as this result is easily obtained with a relay.

DISCUSSION.

Dr. KAPP said that the subject of the paper was of extreme practical importance, but also of considerable difficulty. The author said "the energy associated with a circuit prior to sparking can be regarded as a measure of the incendency of the spark"; but he submitted that not the energy alone, but also the means employed to dissipate it should be regarded as essential factors of the problem. When the current was interrupted the stored energy $\frac{1}{2} L I^2$ must go somewhere; it was questionable whether a condenser was practicable, and the use of an inductanceless shunt to the exciting circuit of the bell was objectionable, because it increased the line current and, therefore, the sparking at the bare mine wires when bridged. The author's device of working the bell on what might be called an inverted principle seemed much preferable, and, to judge from the results of tests given in the paper, this principle was quite successful. Thanks to the author's ingenious device, the problem might be considered solved at the bell; but what about the danger of incendency of the spark when contact was made and broken at any point along the two bare wires? No doubt a relay system would be a solution, but was it robust enough for the rough usage of a mine? He suggested that perfect safety might be obtained in a simpler manner by distributing condensers along the signal wires, and especially putting one at the tail end. This expedient had the advantage that it could be applied to any existing installation, and at very little cost, by using Mansbridge condensers. To show what the effect of thus ballasting the line with condensers would be, he had calculated the sparking conditions of a particular line a mile long, and consisting of two wires spaced 10 in. apart. Its inductance was 2.6 millihenries, and its capacity a little over one-hundredth of a microfarad; resistance 20 ohms. If a current of 1 ampere were broken at the tail end, there would be an oscillation with a periodic time of 34 microseconds, the damping effect of the resistance being very small. During the fraction of a second that it took to remove the iron bar by which the signal had been given, there might be some thousands of oscillatory sparks passing between wire and bar. The r.m.f. at the moment of zero current would be 440 volts, and the maximum power, which occurred at the time of 4 microseconds after the break, was 200 watts. It was true that the total energy stored in this so-called "non-inductive line" was only about 1,300 microjoules, but the frequency was extremely high, and the author had told them that high frequency increased the danger. It was, therefore, quite conceivable that an ampere broken anywhere on this line might produce a dangerous spark. Now let them ballast this line with only 10 mfd. in all, evenly distributed, say, in quarter-mile sections. The frequency of the spark now decreased to 1,900 per sec., the maximum voltage to 1.1, and the maximum power, which occurred 125 microseconds after breaking, had gone down to very little over 2 watts. These figures were well within the limits set by the author.

Dr. C. C. GARRARD said Mr. Morgan had thrown a very considerable amount of light upon a number of obscure points in the question of the ignition of firedamp in collieries. His own view was that all electric sparks in collieries should be regarded as dangerous and should be enclosed in suitable boxes. In his opinion, a switch-box for use in a colliery should be both explosion-proof and flame-tight, i.e., capable of withstanding any internal explosion without emitting flames or sparks which would ignite an explosive mixture outside the box. There were two other points which Mr. Morgan had not touched on. The presence of ethane increased the liability of explosion of methane and air mixtures. The presence of coal dust was also of importance. It had been found that with sufficient coal dust an explosion could be caused by sparks in an atmosphere containing only $\frac{1}{2}$ per cent. of gas.

These facts strengthened the argument for the total abolition of open sparking in collieries. The remarks of Mr. Morgan as to how ignition depended on the ionisation caused by the spark were very illuminating; he was also much interested in the possibility of the violence of an internal explosion being increased by a portion of the explosive mixture within the box becoming compressed before ignition, due to an explosion in another part of the same box. He could confirm that by means of a relay combined with a condenser it was possible entirely to suppress the spark at the signalling wires. But if anything should go wrong with the adjustments of the relay, sparking might still occur at the signal wires. He was, therefore, inclined to think that a mechanical pull arrangement, with the contact-making device enclosed in an explosion-proof and flame-tight box, would eventually replace the bare signalling wires hitherto used.

Dr. RALLING, referring to the apparent disagreement between those authorities who asserted that the process of ignition was entirely electrical or entirely thermal in its origin, said that possibly both were right. It was possible that some sort of atomic turbulence was necessary to all chemical actions between atoms having an affinity for each other, and that this atomic turbulence could be set up either by electrical or thermal agencies.

Mr. E. A. WATSON wrote that the experiments quoted by the author seemed to show that the problem whether a given spark would or would not ignite an explosive mixture was not altogether a question of the total amount of energy available. On the thermal basis of ignition it was comparatively easy to see how it might be possible for there to be a limiting value to the energy below which ignition would not occur. If they considered a small quantity of hot burnt gas surrounded on all sides by a shell of cold unburnt explosive mixture, ignition would only occur if the heat liberated by the burnt core were sufficient to raise the surrounding shell to its ignition temperature. The smaller the volume of the hot core the less would be the ratio of the volume of core to the area in contact with the surrounding shell and the greater the cooling effect. They should therefore expect that before ignition of the whole charge could occur it would be necessary to raise a definite volume of gas to the ignition point, and this would, of course, require a definite amount of energy. They should, further, expect that the value of the minimum energy required would be affected by the pressure and temperature of the explosive mixture before ignition. The fact that although one spark would not ignite a given mixture yet a rapid succession of sparks would do so, might quite well be due to the heating of the mixture by the energy liberated. In this connection it was interesting to note the very large range of variation in the energy of the spark given by different makes of magnetos on the market, all of which might be said to give satisfactory ignition of the explosive charge. The output of a magneto varied considerably with the speed, but taking a standard speed of 500 R.P.M. it was found that the energy per spark given by various single-cylinder magnetos varied from 0.007 joule for a small American magneto to as much as 0.065 joule for a high-class English machine intended for very similar duty, i.e., a range of output of very nearly 10 to 1. It would therefore seem that either the one machine must be unsatisfactory or the other must be needlessly powerful. The problem, however, was complicated, as much probably depended upon the speed of the engine, it being quite conceivable that an amount of energy which would be sufficient for a slow-speed engine might be inadequate for a high-speed one. It was well known that a substantial increase in B.H.P. might be obtained in most large high-speed engines by igniting the charge simultaneously at two points in the cylinder, but there appeared to be no data available to show whether an increase in B.H.P. might be obtained by increasing the energy at the sparking plug.

Mr. S. P. WALKER wrote that 25 years ago the question arose whether the spark on breaking circuit after ringing by pressing the naked iron wires together would ignite gas; he made some very exhaustive experiments, from which it appeared that there was very little chance indeed of ignition taking place. The signals which he fitted up in mines almost universally employed single-stroke bells, with which the danger of ignition of gas by sparks was considerably reduced. For complete immunity, he thought naked wires would have to be given up, and that connection for ringing would have to be made in explosion-proof cases. About 35 years ago he adopted the relay system at the Nunmery Colliery, Sheffield, but for a totally different reason. A signal was fixed on a very long engine plane, which was also very wet, and the leakage was so great that batteries would only keep up to their work for a very short time. He fixed a relay and put six cells only to work it, connecting the remainder in the local circuit with the bell. The arrangement was completely successful. The leakage was reduced within reasonable terms, and the signals remained loud and strong all the time.

Burnley.—A special meeting of Corporation employés, including tramway workers, has declined the offer of the Council of an increase of 5 per cent. for men earning 30s. and under, and an increase of 1s. per week for those earning over that amount. It was decided to press the original demand for a 3s. increase to the utmost limits.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The A.E.G. Meeting.

In closing this correspondence, I see another anonymous contributor, siding with "Anti-Humbug," accuses me of "obfuscation." Surely, the boot is on the other foot. I replied to the charge that it was as much as the existence of the E.C.A. was worth to tackle the problem of trading with enemy concerns such as the A.E.G. My contrary contention has now been fully conceded by "Anti-Humbug," and I am satisfied.

Allow me to repeat that the E.C.A. does represent the bulk of the capital invested in electrical contracting in this country, and its members are not guilty of the crime specified.

H. Marryat.

Chiswick, January 3rd, 1916.

Salaries in Power Stations.

In connection with the alleged shortage of power station assistants, it would appear that at last the Government are beginning to realise that electricity works, like railways and collieries, are of vital importance to the maintenance of industry, and in particular to the production of munitions of war. Now that the important fact has been brought home to the Ministry of Munitions, it is to be sincerely hoped that a businesslike policy will be adopted in regard to any matters connected with the supply of electricity and questions affecting electricity works employés, etc.

It will be agreed that electrical station men as a class have responded nobly to the call and offered their services for the Forces or as skilled engineers on munition work, although in many cases managers and committees have refused to sanction any temporary depletion of their staffs. The result has been, of course, that some of the more patriotic spirits have resigned in order to join the Forces, whilst others again have left to take up more attractive and better-paid positions in other stations or with firms engaged on Government work.

In order to stem the tide of affairs, chief engineers and managers have in many cases offered paltry war bonuses and an enamelled badge to the members of their technical staffs, with a view to compensation for the increased cost of living, and possibly to imbue the men with the importance of their position in the community. The bait has been swallowed in too many cases, but lately there appears to have been more real difficulty in getting men for charge engineer and switchboard duties, and whilst some engineers and managers have in a businesslike manner offered a living wage and secured competent men, others (judging by their advertisements) still try to continue the "penny wise and pound foolish" policy of employing underpaid technical assistants, and, to crown all, actually wonder why they can't get men!

In several instances the reprehensible practice of promoting comparatively untrained switchboard attendants to the position of "charge engineer" has been resorted to, no doubt, with a view to economising on the salaries item; but the results of such a policy are apt to be reflected in the shape of increased generating costs, particularly in regard to the steam side of the plant.

One hesitates to think that a power station in some fairly important industrial and munition area, containing some thousands of kilowatts of plant, may be placed under the charge of a comparatively inexperienced ex-switchboard attendant as "charge engineer," his salary perhaps being on a level with the wages paid to his engine driver or greaser; and yet there are no regulations in force as yet to prevent this being done.

Thanks to the Board of Trade regulations, our mercantile marine, which we depend upon so much at present, is in a far more enviable and safer position than some of our power stations with regard to its engineers, despite the fact that so many of them have been taken over for naval and transport duties by the Admiralty.

The Institution of Electrical Engineers never has evinced a genuine interest in electrical stations or their engineers; the Board of Trade and the Home Office may, of course, do so in the future, but at present let us hope that if the Ministry of Munitions takes the responsibility of controlling staff matters, it will not overlook the question of competent engineers and an adequate living wage.

Chief Assistant.

Domestic Electric Heating.

Referring to your issue of December 24th, there is one feature of electric heating which appears to have been completely overlooked by most writers. We have found, in Indian hill stations, that a 3-kw. radiator placed under a dining or office table provides all the warmth required when snow and ice are all round the house. The air temperature in these circumstances may not be above 45 deg., but this is a matter of no moment so long as warmed air is rising from under the table. As your leader points out, the normal temperature of

60 deg. is no guide whatever to comfort. I am writing from personal experience in three successive winters, with a tariff well below point five, namely 15s. 4d. per kw. of maximum demand with unrestricted use.

J. W. Meares.

London, E.C., December 30th, 1915.

The Position of the Swedish General Electric, Ltd.

Questions raised in anonymous letters which have lately appeared in the electrical Press seem to indicate a desire on the part of some writers to ascertain the position of firms having connections with manufacturing companies in neutral countries.

We should, therefore, be glad if you would make it known in your columns, by publishing this letter, that we shall be very pleased to give full particulars of our company and of our parent concern, Albmanna Svenska Elektriska Aktiebolaget, Vasteras, Sweden, on application at our offices, Canada House, Kingsway, W.C., where the documentary evidence we have already had the pleasure of putting before you, and which has also been submitted to the authorities, will be available for inspection.

This evidence, we have no doubt, will be accepted as satisfactory proof that Albmanna Svenska Elektriska Aktiebolaget is a purely Swedish concern, not under the influence of any banks, firms, or persons in countries now at war with Great Britain, and that this company's business has been conducted in a manner in no way detrimental to the interests of the Allies.

None of the shareholders and none of the directors of the Swedish company are of enemy nationality.

The Swedish company has issued in all 150,000 shares, held by 1,530 shareholders. The largest number of shares held in one hand is 2 per cent. of the total.

The Swedish company has no working arrangements or understandings of any kind with enemy firms for the protection or control of each other's interests.

The Swedish General Electric, Ltd., has issued in all 5,000 shares, of which 4,996 are held by Albmanna Svenska Elektriska Aktiebolaget.

The Swedish General Electric, Ltd., has secured the services of various persons resident in England previously in the employ of companies controlled by German capital, but they have done so, following the example of prominent British firms, solely in their own interests, and without any arrangement whatever with the companies by whom such persons were formerly employed, or with the foreign firms controlling same. There is no agreement or understanding whatever with or regarding any such employees by which any such employees shall at any future time enter into their former employment, or into the employ of any other British or foreign firm.

The Swedish General Electric, Ltd., has not since the outbreak of war bought or sold any goods manufactured in countries now at war with Great Britain, or taken over or assisted in the disposal of stock owned at the outbreak of war by companies controlled by enemy capital.

Swedish General Electric, Ltd.

By order of the Board,

W. I. TURNER, Secretary

London, W.C., January 3rd, 1916.

WAR ITEMS.

What the Germans Think of Russia's Future Trade.—An American Consular report draws attention to an interesting article on German trade with Russia, which appeared in a recent issue of the "Neue Zürcher Zeitung." Ridiculing any danger of a boycott of all German goods in Russia or of Germany being compelled to yield the Russian market to neutral or the Allied countries, this article lays emphasis on the conservative nature of the Russian merchant, who, it states, is not kindly disposed towards innovations, and could not easily be persuaded to purchase new brands of goods. It points out, as an instance, that the style of electrical apparatus has not changed for 10 years. Allusion is made to the careful "intensive cultivation" of Russian markets by Germany over a long period of years, and the causes of success are stated to be the long credits given by German traders—6, 9, 12 or even 14 months—and the low prices of German goods. It is affirmed that in electrical supplies Germany has no competitor in the Russian market. German influence is extensive; in business houses managers and foremen are almost invariably Germans, and buyers are either German or Russian. "As a result of long years of co-operation there has developed a sense of mutual confidence, and why should it disappear all of a sudden? . . . A boycott of German goods is altogether out of the question, for the mere reason that the loss resulting from a community of interests extending for a long period of years will bind the two countries again after the conclusion of the war. In conclusion, it may be noted that there is hardly a German commercial house of any size that is not represented in

Russia, and that there is a whole staff of German agents and other people who have for years been making their living through German houses, and it is hardly likely that they will suddenly take up with new ventures for the mere purpose of persuading the Russian peasant that French and English goods are better than German. After the war is over the Russian will know no more about France or England than he did before the war, for while he probably never heard English or French he knows something about German, and the Germans say to it that in every small town there should be some German representative of their business."

Trading with the Enemy.—The Foreign Trade Department of the Foreign Office has been set up by the Foreign Office as a new Department in order to carry out the policy embodied in the Trading with the Enemy (Extension of Powers) Act, 1915. This Act gives power to prohibit trade by any person, firm or company in the United Kingdom with any enemy persons or association established in neutral countries. As the Foreign Trade Department will be concerned with preventing trade by British firms and companies with the enemy in neutral countries, it has been decided to merge with it the Trading with the Enemy Department of the Home Office, which has had the duty of enforcing the measures already taken to prevent trading with the enemy, and the staff of which will continue to perform the same duties as members of the new Department, in addition to taking part in the administration of the new Act. Questions of contraband or the hindrance of overseas trade between neutrals and the enemy and the licensing of exports from this country, and all questions of trading with the enemy other than those described above, will continue to be dealt with by the Government Departments which have hitherto been charged with these questions. In order to secure the full benefit for British interests of the policy of the Department, the advice and assistance of business men will be invited through the Chambers of Commerce and other trade organisations. It is recognised that the success of this policy will depend upon the active co-operation of the business community. It is hoped, therefore, that business men will be willing to aid the Department, and also that they will not hesitate to consult it in any matter in which it can be of assistance to them. Mr. L. Worthington Evans, M.P., has undertaken the direction of the new Department, with the title of Controller of the Foreign Trade Department of the Foreign Office. Offices have been obtained at Lancaster House, The Mall, S.W. (above the London Museum), which were opened on January 5th. All communications (including those relating to matters previously dealt with by the Trading with the Enemy Department of the Home Office) should be addressed to the Controller of the Foreign Trade Department, Lancaster House, The Mall, S.W.

An Australian Desire.—In the Fitzroy Council recently there was a discussion about the purchase of an electric motor. A British firm, which quoted £51, could not supply the motor for which it tendered, and the Works Committee wanted to buy one for £40 from America. It was moved that this be referred back, one councillor saying that they ought not to deal with any but British or Australian firms; another saying that the British firm could not fill the order; and a third suggesting that an Australian gas engine ought to be bought rather than an American electric motor. The matter was eventually referred back, on the understanding that only British or Australian motors be purchased. All of which shows how very strongly the wind is blowing in our favour in Australia at present. May British firms be prepared to grasp the opportunity.

After the War Trade: Government Promises.—The week before last we devoted considerable space to a discussion on after the war problems, which took place in the House of Lords. We welcomed that debate, because we regarded it as an indication that at last the time had arrived for the discussion of such matters in Parliament. While our pages were being run off the machines the House of Commons was holding its last sitting of a momentous year, and Mr. Runciman, the President of the Board of Trade, was giving an account of work which has been undertaken by his department, with the assistance of outside experts, for the purpose of safeguarding our national trade and commercial interests after the war. Many questions have been asked in the Commons on these matters, but the reply has generally been that the Government could not yet make a statement. The fact of Mr. Runciman's speech following so speedily upon the debate in the Lords, seems to us to show that our legislators having got over some of the very serious problems of other kinds, immediately connected with the conduct of hostilities and the production of munitions, that have arisen, are now able to give fuller attention to these other matters which were bound to become of predominant importance sooner or later. We are glad that these speeches were not longer delayed, for in absence of them, profitable discussion, either in the Press or in business circles, could not have continued. We can quite understand that in preparing the way for a Government trade and industrial course of action a large number of subjects have had to be exhaustively investigated, and we do not think any exception can be taken to the adoption of secret inquiry in this connection. Without proper data to go upon no sound, satisfactory, or permanent policy could be evolved which would bear the test of searching public examination when the right time came.

Since Mr. Runciman made his speech the matter has taken on a somewhat altered aspect owing to the controversy in the Cabinet and in the country on the question of compulsion, the single men not having responded as duty called them to do under Lord Derby's scheme. Mr. Runciman, as President of the Board of Trade, has national trade affairs under his care, and if he and Mr. McKenna do not champion the cause of export trade, it is not likely that others will feel that their particular office in the Cabinet requires them to do so. The fact is that all along Cabinet Ministers have emphasised the maintenance of our export trade as far as possible during the war, and others have been agitating for far-reaching efforts at "capturing" German trade, but when these speeches were delivered apparently those who made them did not know how many men it would be necessary to call away from their ordinary callings in order to ensure victory. Perhaps they do not know now, but we may leave the members of the Cabinet, at this moment, to settle the supreme question, assured that industry will consistently and loyally follow them by making whatever sacrifices are shown to be necessary in order to hurry up the end of the war. But nobody will wish to deprive Mr. Runciman of the credit that is his due for work done at the Board of Trade during the last eighteen months. His speech on December 23rd showed how fully he had entered into the spirit of the trade problems of that period and the other problems that are anticipated. We observe that he has been described in the German Press as our "Minister of Commerce," and while we remember that there has been, and still is, a very wide appeal for the setting up of such an office, we also recognise that a great deal of the work that has been going on in his department is certainly preparatory and investigation work of a kind which can well form a basis for our future national action. Both he and Mr. Asquith have been careful to inform the House that such work has consisted largely of the collection of material, and that some committee or other, either from inside the House or from among Government officials, or from business and other experts outside, will require to analyse and report conclusions indicating what the future policy of the nation consequent upon all these investigations should be. Mr. Runciman showed that practically every item of our commercial life must come under review at such a time as this, for when the war was over not one of them would stand in the same position as before the war. In every case the relationship of Germany and Austria to what might be called the Central Power Zollverein was bound to conflict with our interest. There were some special subjects of a highly technical character which the Board of Trade were not prepared fully to investigate themselves, and these he had referred to a very small team of business men outside. These investigations covered a great variety of subjects. Among them were the use made by the Germans of the English financial system, the use made of British ports by German tonnage, and the position of German owners of British companies who claimed the advantage of our ports and flag, and the ownership of real property by aliens. The Board were sending to Italy an excellent representative to collect information on which they would be prepared to act, with the idea of capturing some of the trade done by Germans previously. As far as commerce was concerned, Germany was a beaten nation, and it was our business to take good care that she did not get her head up to the same extent after the war was over. The advantage of the investigations already made was that they had been made without arousing suspicions. Mr. Runciman said it must be the business of the Board of Trade to see that the commercial men of this country were given every advantage that the Government could place at their disposal, in order to secure for us our share of the commercial and industrial advantages that Germany enjoyed before the war.

Well done, Mr. Runciman! This is the position stated in a nutshell. If the Board of Trade really rises to the occasion in the thorough way that this speech indicates, and if British manufacturers take full advantage of the excellent opportunity that such an aggressive and enterprising policy should put in their way, we shall not have reason to be down-hearted—even the demand for a Ministry of Commerce would not be heard had we a Board of Trade that was really intelligently, and with a full and expert knowledge of our different industries, assisting us in all the ways that are practicable at home and abroad. But why send to Italy only? There are other and vaster countries—and we might say Colonies, too—where the need for "Special Representatives," or for additional ones, is very pressing indeed.

War Effects in New Zealand.—H.M. Trade Commissioner in New Zealand recently reported:—"The pinch of the war is being felt by those engaged in the electrical trade in Wellington. It is not nearly so easy now for an electrical firm to secure delivery of certain lines of goods as it was six months ago. There is a steady depletion of stocks of brass holders and plugs, hitherto supplied by Germany to a large extent, and if a source of supply of these and other small electrical goods is not soon found, some embarrassment will be experienced by the trade during the next twelve months."

Trade After the War.—With a view to focussing the opinion of the commercial community in all parts of the Empire, says the "Daily News," the British Imperial Council of Commerce, which is the representative body of the Chambers of Commerce and Boards of Trade throughout the

United Kingdom and British Dominions, is convening a conference in London in June next. A provisional programme has recently been circulated to the members for their consideration. The programme is drafted under three main heads: Fiscal questions, legislative questions, and voluntary action by Chambers of Commerce and Boards of Trade. The items enumerated under each head include compulsory registration of aliens throughout the Empire, measures against the "dumping" of enemy goods, and the limitation of membership of Chambers of Commerce, etc., to British-born subjects.

It is announced that a joint committee of the London Chamber of Commerce and the National Patriotic Association has called a meeting on the subject of "Business after the War" for Monday, January 31st, at the Guildhall.

Controlled Works.—There are now 2,422 "controlled establishments" under the Ministry of Munitions.

Recruiting Notes.—It is reported to the Eastbourne T.C. that of the regular staff of 39 at the electricity works, 11 have joined the Forces, one has fallen in action, and another has returned medically unfit. Of the present staff, 18 have joined under Lord Derby's scheme, and the other 21 are ineligible.

A report to the York T.C. states that of the staff of 82 in the electricity department, 32 are with the Forces, and 43 in the reserve under Lord Derby's scheme; of the latter, 16 have official badges, and will not be called up. In the tramways department, 40 men are serving in the Forces, and 59 are enrolled in the reserve.

The whole of the eligible members of the staff of the Exeter electricity department have attested under Lord Derby's scheme.

LEGAL.

ELECTROLYTIC ZINC.

AS reported in the ELECTRICAL REVIEW of December 17th, the Refractory Zinc Ore Treatment Co. applied in the Patents Court for a licence to use the German Patent No. 605 of 1909 for a process for the manufacture of anodes of massive manganese peroxide for use in the electrolysis of aqueous salt solutions, such as zinc sulphate solutions, to obtain commercially pure zinc.

The massive manganese peroxide anode, however, although it resists chemical action and maintains the electrolyte pure, has a comparatively small electrical conductivity, and the Refractory Zinc Ore Treatment Co. on Thursday, December 30th, applied in the Patents Court for a licence to use Patent No. 15,128 of 1911, belonging to Messrs. Siemens & Halske, of Berlin, for an anode in which pieces or rods of lead peroxide are embedded in pure manganese nitrate or in a mixture of crystalline peroxide and manganese nitrate. By this means is obtained an intimate union of the lead peroxide conductor with the manganese peroxide, so that the conductivity of the anode is increased to the desired degree. The application was heard by the Deputy Controller, Sir Cornelius Dalton.

Mr. Edward Evans appeared for the applicants: Mr. C. Barnard Burdon for the patentees.

Mr. BURDON, before the new application was heard, said he desired to correct statements made at the last hearing to the effect that the main work in applying this electrolytic process to the production of pure zinc had been done by the applicants, and that some of Messrs. Siemens & Halske's patents were based on applicants' investigations. He had lately received a belated letter, which indicated that the foreign patentees took out patents about 1913, independent of the experiments of the Refractory Zinc Ore Treatment Co. The royalty offered was a microscopic one.

Mr. EVANS said the difficulty was that they did not yet know what was the life commercially of an anode. Applicants were entirely deprived of the patentees' assistance in proving this process experimentally, and applying it economically to zinc. An elaborate and expensive plant would be required to produce the zinc, apart from that required to produce the anodes, and they would have to look to British manufacturers to help them. The patent now being asked for was highly important for the production of zinc. A price on the basis of the zinc produced was an unfair way of reckoning it. He would put it on the weight of the anode. The applicants had developed this thing on its commercial side entirely without the help of Siemens & Halske.

Mr. BURDON recommended a double royalty—(1) On the basis of the electrode; and (2) a small royalty on the zinc produced. The small royalty paid to Messrs. Siemens & Halske was due to the fact that the patentees were told that prices were then so out down in the zinc trade in this country by foreign competition that it would not be possible to pay more.

Mr. EVANS suggested a royalty of 5 per cent. on the manufactured anodes. He explained that his difficulty with regard to a royalty on the selling price of zinc was that it would probably be necessary to float a separate company to make the zinc, and for that a great capital would be required. The patent covered both the making of the anodes and the getting of the zinc, and the licence would cover both these processes.

THE DEPUTY CONTROLLER said he gathered that the applicants would pay a royalty of 5 per cent. on the anodes they made for

sale to a zinc-getting company, or 1s. per ton on any zinc they chose to manufacture themselves. The royalty would be on whatever they manufactured for sale.

MR. EVANS. And where we pay royalty on any anodes, there is to be no further royalty in respect of zinc.

MR. BURNON asked that the licence should specify that the power to use the anodes was not given for any other electrolytic purpose, and that all parties should pay a royalty to be estimated upon the basis of the zinc produced.

SIR CORNELIUS DALTON said he would communicate with the Board of Trade, and the applicants would hear from them at an early date.

ROSE BROS. v. BULL.

In the City of London Court, on January 4th, before his Honour Judge Atherley-Jones, K.C., Rose Bros., 38, Beech Street, Barbican, E.C. electricians, sued a man named Bull, trading as W. J. Clarence, 42A, George Street, Richmond, for 10s. 8d. for dry batteries for electric flash lights supplied.

The plaintiff Rose said that the goods were supplied in January of last year. Defendant complained of them, and they told him that they knew they were not as good as they would be in a few weeks, when their batteries would be equal to any on the market. In starting a new factory there were difficulties to contend with. They were making the claim on principle, as defendant had behaved in a truculent fashion, shouting in their place: "You sell nothing but 'dud' batteries." They should have been returned within three months if there were any complaints. In cross-examination the witness said the batteries were made by the British Battery Co. Defendant: They were guaranteed for six months. Plaintiff: If returned unbroken within three months we would have taken them back. Defendant: I gave the order on the understanding that they were English batteries and guaranteed for six months. They were made abroad, probably in Germany. Plaintiff: You complained of the English batteries and we sent you Dutch. We could not get German ones if we wanted. If they were German they would have been good ones. We are now making our own. They are not yet quite as good as the Germans; but they will be as soon as we get the raw material.

Judge Atherley-Jones found for the plaintiff. Defendant: It is not fair. This is an absolute waste of money. The Judge: You should have returned them sooner. I cannot discuss it with you.

BUSINESS NOTES.

Consular Notes.—HOLLAND.—In a report from The Hague, an American Commercial Attaché states that, with the increase of the efficiency of machinery for generating, distributing and applying electricity, and making it less difficult to control, there has arisen an increased demand for small electric motors for work on farms in connection with threshing, feed cutting, churning, &c. The thickly-populated country, with its small and intensive farms, offers an inviting field for enterprise in the form of a central power station. The unlimited water supply from the navigation canals solves the problem of good feed water for boilers and cool condensation water for engines, and counterbalances to a large extent the high cost of fuel. Germany has hitherto furnished most of the electrical machinery, but this source of supply is now practically unavailable.

CHINA.—An unconfirmed report states that the board of directors of the China Eastern Railway has awarded the concession to the Russian firm of Barski & Co., at Harbin, Manchuria, to construct an electric tramway between Pristan and Old Harbin, *via* New Harbin, the total length of which is to be about seven miles.

In a comprehensive account of the effect of the war on South China trade, the American Consul-General at Hong-Kong points out that the chief result of the present state of affairs has been the shutting off of European markets for Chinese products, until prices for such products have fallen so low as to make production unprofitable even where the goods could be sold at all. This has, of course, depreciated the ability of China to buy for import. In most lines, therefore, the year's business has been confined to the liquidation of accumulated stocks. As a result of general business depression, there has been less demand for electrical machinery, and what demand has existed has, consequent upon high prices and uncertainty of delivery of British goods, reached the United States in unusual degree. A contributory cause to the falling off in trade in electrical lines is the cessation of German financing of electrical power and light projects. The Consul-General, whilst claiming an increased and increasing demand for American supplies, frankly admits that this is due more to the unique position of the United States as a great trading non-belligerent nation, than to any special activity on the part of American business men.

SPAIN.—From information supplied by the American Consul at Seville, a German electric company—the Compania Sevillana de Electricidad, of Seville—is having marked success. For the year 1914 the receipts, 2,267,436 pesetas (peseta = 86d.), and profits, 980,336 pesetas, show increases over the figures for the previous year of 190,000 and 94,000 pesetas respectively. Since 1911, this company has paid dividends of 8 per cent. annually, established a reserve of 405,000 pesetas, paid 3,485,000 pesetas for the redemption of bonds, and has now a capital of 12,500,000 pesetas.

The company manufactures its own electricity in Seville, and has made an arrangement with the hydro-electric company, which takes its power from the Guadiaro, to have the exclusive right to sell its power in this city. It is, however, interesting to note that a new company—the Catalana de Gas y Electricidad S.A.—financed by Spanish and British interests, started business during 1914, and is having considerable success, although this does not appear as yet to have materially affected the receipts of the older German company.

SOUTH AMERICA.—The American Consul-General at Buenos Ayres, commenting on a meeting of the board of directors of the Camara Sindical de Comercio with reference to the causes restricting the development of commerce between Argentina and the United States, emphasises the importance of the opportunity which now offers itself to American manufacturers to compete for this valuable market. The causes of American failure in the Argentine have been the refusal to give long credits and neglect to consider the peculiar requirements of the country, resulting in the frequent dispatch of goods of quite a different character from those ordered, on the erroneous principle that the next closest thing will suit as well. Laying stress on the present abnormal conditions and the fact that the deviation of trade to the United States is mainly due to the temporary enforced withdrawal from this market of European countries, the Consul-General urges American traders to utilise the present opportunity to lay a solid foundation so that, at the end of the war, they may have become securely entrenched. Argentine newspapers, notably *La Prensa* and *La Nacion*, also openly warn American manufacturers that the present situation must not be taken as a guarantee of the success of American goods when affairs have resumed a normal state. In this connection it is pointed out that the intermediaries and agents in the present accidental commerce are European houses and firms who have recourse to the United States only provisionally, and who logically will endeavour to resume their original relationship as soon as circumstances will allow.

An interesting and instructive table showing the total value of imports of incandescent and other lamps into South American countries from 1910-14 inclusive, is published in a recent American Consular report. The figures for 1913 and 1914 giving details of the imports from each manufacturing country, are not in some cases available, but some interesting comparisons are shown. In Brazil the relative figures from 1910-12 in respect of electric and electric lighting apparatus for Germany, the United Kingdom and the United States, were as follows:—

	Germany. Paper milreis.	United Kingdom. Paper milreis.	United States. Paper milreis.
1910 ...	2,401,121	1,788,954	4,425,563
1911 ...	3,695,937	2,635,266	5,079,112
1912 ...	4,251,435	1,760,080	6,368,801

The figures for the Netherlands and Austria-Hungary for the same period rose from 14,108 to 75,718 paper milreis, and from 20,628 to 109,147 paper milreis respectively. For incandescent lamps imported into Argentina, the figures for the United Kingdom show an increase from 1910 to 1913 from 38,000 to 67,000 pesos, for the Netherlands an increase from 96,000 to 108,000 pesos, for Austria-Hungary an increase from 8,000 to 28,000 pesos, whilst those for Germany and the United States show decreases from 324,000 to 241,000, and from 69,000 to 42,000 pesos respectively. The provisional figures for total imports of incandescent lamps for 1914 show a decrease for the year from 495,000 to 257,000 pesos. The figures for Mexico for 1910-12 are rather startling. The total imports for electric incandescent lamps decreased from 704,912 to 617,476 pesos, but the figures for the United Kingdom show a decrease from 26,417 to 550 pesos. The figures for Germany and Austria-Hungary decreased from 274,796 to 183,230 and 25,198 to 11,335 pesos respectively, but increases from 169 to 2,528 and 360,045 to 441,932 pesos are recorded in respect of the Netherlands and the United States. In Peru, out of a total for 1913 of £8,161 in respect of incandescent lamps, only £282 relates to the United Kingdom, the figures for Germany being £4,671 and for the United States £2,968.

Copper Stealing.—A fine of £20 was imposed by the Widnes Magistrates, on Thursday last week, on Victor Horace Osborne, foreman erecting electrical engineer, of Chatham Street, Stockport, who was charged with stealing 162 lb. of copper and 421 lb. of copper, the property of his employers, the B.T.H. Co. It was stated that the prisoner was supervising the erection of electrical plant at the Sullivan Chemical Works, Widnes, and Supt. Foster said that the police visited a local marine store and found that prisoner had disposed of a quantity of copper. For failing to enter in a book an account of all articles purchased, Charles Bond, marine store dealer, of Lugsdale Road, Widnes, was fined 40s.

RECEIVING STOLEN COPPER.—Thomas Wilson, coal and metal merchant, of Pendleton, was sentenced to six months' imprisonment in the second division by the Salford Recorder, on Monday, on a charge of receiving 1 cwt. of scrap copper, well knowing it to have been stolen. The copper was taken from the British Westinghouse works at Trafford Park.

Bankruptcy Proceedings.—WILLIAM CAREY WILD, electrical engineer, 57, Rhodes Street, Halifax.—At Halifax Bankruptcy Court, on December 30th, a receiving order was made on debtor's own petition. First meeting, January 12th; public examination, January 14th, both at Halifax.

AUGUSTINE GARBOTT, "electrical engineer, now weighing machine attendant," Leeds.—Receiving order made December 31st, on debtor's own petition.

Trade in 1915.—The January issue of the *Chamber of Commerce Journal* contains a series of special reports by experts in the leading trades, regarding the trade and industry of the United Kingdom in 1915.

Trade Announcements.—THE LONDON COMMERCIAL ELECTRICAL STORES, LTD., have removed their offices and stores to 13, Farringdon Avenue, E.C. Telephone number: "Holborn 530"; telegrams: "Galvorite, London."

Owing to the increased business, MESSRS. CAVE & HIGGIN, LTD., have removed to more commodious premises at 265, Deansgate, Manchester (telephone number: "Central 1283").

Catalogues and Calendars.—THE VICTA ELECTRICAL CO., of 60, Queen's Road, Battersea, S.W., have issued a circular relating to their facilities for repairing electric meters during war-time; also a wall calendar for 1916, with monthly tear-off slips.

MR. W. H. JOHNSON, of 14, Pantons Street, London, S.W., has in circulation a wall calendar, with small monthly slips for 1916, which in design effectively illustrates the fact that he is sole European representative for "Rmy" electric apparatus.

THE DAVENPORT ENGINEERING CO., of Harris Street, Bradford, have prepared a wall calendar, with daily date slips, for the current year.

THE COUNTY OF LONDON ELECTRIC SUPPLY CO., LTD., of Moor-gate Court, E.C., have prepared a telephone card for the convenience of consumers.

THE GENERAL ELECTRIC CO., LTD., 67, Queen Victoria Street, London, E.C.—New catalogue of between 40 and 50 pages giving illustrated particulars of their various types of "Wittson" starters, regulators, starting panels and controllers. Prices and other details are tabulated, and dimensioned drawings and diagrams of connections occupy the last few pages.

MESSRS. POPE'S ELECTRIC LAMP CO., LTD., Hythe Road, Willesden, N.W., have issued a wall calendar with plainly printed monthly tear-off slips.

MESSRS. THERMIT, LTD., of 27, Martin's Lane, London, E.C., have again issued one of their pocket memoranda books, the opening pages of which contain a good deal of illustrated information concerning Thermit welding, some useful tables, and calendars for 1916 and 1917.

MESSRS. LANGDON-DAVIES MOTOR CO., of 110, Cannon Street, London, E.C., have sent us a handy-shaped pocket notebook, the opening pages of which contain tables of information respecting some of their standard sizes and types of motors (single-phase, polyphase, and D.C.), while an insurance coupon lies in the front pocket.

THE L.P.S. ELECTRICAL CO., of 18, Adam Street, Strand, London, W.C.—Pocket pamphlet of 16 pages containing illustrated particulars of their current-carrying universal test clips.

MESSRS. W. BARNES & SON, Globe Works, Queensland Road, Holloway, London, N.—Illustrated circular showing various descriptions of perforated steel cable plates, metals and wire-work.

MESSRS. ALFRED HERBERT, LTD., of Coventry, have sent us one of their very acceptable wall calendars with monthly sheets for 1916, with bold printing on good white paper.

MESSRS. PORTER PATENT SAFETY SEALS, LTD., 7 to 9, Belfast Road, London, N.—Prices and samples of their patent safety seals for electricity meters, &c.

Dissolutions and Liquidations.—POWER GAS ECONOMY, LTD.—This company is winding up voluntarily, with Mr. J. Duncan as liquidator. A meeting was called for yesterday at 149, West George Street, Glasgow.

NELSON'S COAL CONVEYOR, LTD.—A meeting of creditors is called for January 3rd, at 142, Park Road, Wallsend. Mr. T. Rose, liquidator.

BILBIE, HOBSON & Co., engineers, 106 Queen Victoria Street, E.C., and Daverell Street, Great Dover Street, S.E.—Mr. H. G. Hall has retired from the partnership, and Messrs. J. B. Bilbie and J. S. Wyldie will continue the business under the same title, &c.

CEDES ELECTRIC TRACTION, LTD.—A petition presented by the Tudor Accumulator Co., Ltd., for the winding up of this company, is to be heard on January 18th, in London.

SALSBURY LAMPS, LTD.—A meeting is to be held on February 7th, at 15, Eastcheap, E.C., to hear an account of the winding up from the liquidator.

Book Notices.—"The Mechanical World Electrical Pocket Book for 1916" (Emmott & Co.; price 6d. net) contains new sections on switchgear and switchboards, earthing, "reducers" for half-watt lighting, and the efficiency of dynamos and motors, and the accumulator notes and sections on lighting circuits and switching, and electric lighting, have been revised and extended. The book gives a remarkable amount of condensed information for the small price charged, and has the great advantage that it opens like other books.

"The Mechanical World Pocket Diary and Year Book for 1916" (Emmott & Co.; price 6d. net), now in its 29th issue, contains several new tables, while much additional information regarding steam boilers has been inserted. A separate section is devoted to the Diesel engine, and notes on brazing and soldering have been added.

Measurements for the Household (Circular No. 55 of the Bureau of Standards, U.S.A.) is a remarkable departure from precedent, in that although the product of a Government Department, it takes cognisance of the existence, requirements and implements of the domestic household and aims to instruct the householder as to units and methods of measurement generally, methods of checking the quantities of goods bought by weight and measure, and the

methods in vogue for cheating him—or rather, her. In this country, we fear, the average housekeeper would actively resent such an incursion into her sphere, which she believes she alone understands, and she would certainly decline to be taught anything about the efficient management of her domain; but perhaps our trans-Atlantic cousins are less dogmatic in such matters and are willing to learn something of scientific method. We have examined the circular—which comprises nearly 150 pages—with interest, and unreservedly congratulate the authors on the manner in which they have carried out their work, and on the admirable matter, both text and illustrations, which the volume contains. True and false weighing and measuring instruments (some of the fraudulent ones showing marvellous though misguided ingenuity), thermometry, fuels, combustion, lighting, electricity, gas and water supplies, with the corresponding meters, humidity, barometric pressure, hydrometry, and time are amongst the subjects dealt with; the treatment is extremely clear and simple, yet accurate, and the information given undoubtedly should go far to reduce the waste and increase the comfort obtaining in the domestic household. Although the first edition is only a few months old, a second is already in preparation, and the newcomer merits the warmest welcome and approval.

"Science Abstracts," Sections A and B. Vol. XVIII, Part 12, December 28th, 1915. London: E. & F. N. Spon. Price 1s. 6d. each. The December number of the "Journal of the Tramways and Light Railways Association" contains a full list of members of the Association and their addresses.

"Journal of the Institution of Electrical Engineers," Vol. 54, No. 253, January 1st, 1916. London: E. & F. N. Spon, Ltd. Price 3s. 6d.—This issue contains the following papers:—"Design of High-Pressure Distribution Systems," by Mr. J. R. Beard; "Mathematical Design of Transformers," by Prof. D. Robertson; "Electric Generating Stations in China," by Prof. C. A. Middleton Smith; "Pole-Face Losses," by Mr. F. W. Carter.

"The Principles of Dynamic-Electric Machinery." By B. F. Bailey. London: Hill Publishing Co. Price 12s. 6d. net.

"The Electrical Engineers' Diary for 1916." London: S. Davis and Co. Price (stiff boards or limp cloth) 3s. 6d. net.

We have received a copy of a new monthly paper, *Russia*, which is published in London at 6d. It is a commercial, financial and literary review, and contains the official bulletin of the Russian Chamber of Commerce in London. One of the articles discusses engineering prospects in Russia; others deal with Russian traffic routes and Russian credit.

LIGHTING AND POWER NOTES.

Aberdeen.—The Electricity Committee has renewed the contracts for the supply of electricity to the Harbour Commissioners and the Great North of Scotland Railway Co. The number of units generated in November was 1,301,800, as compared with 1,138,140 units in the previous year, an increase of 163,660 units.—*Evening Gazette*.

Birmingham.—PLANT EXTENSIONS. — The Electric Supply Committee recommends the City Council to approve a scheme for extending the temporary generating station just completed at Nechells. This recommendation is the outcome of certain negotiations, and the decision of the Committee, in view of the fact that the temporary station would only be sufficient to meet the demand of existing consumers, not to accept any further applications for supplies. Manufacturers who had accepted orders for urgent work thereupon took steps to compel the undertaking to supply. The alternatives of proceeding with the permanent station, or erecting an extension to the existing temporary station, were considered, but it was found that new plant could not be installed in the permanent station before the winter of 1917, whereas the temporary extension will, it is hoped, be ready for use during the winter of 1916. The cost of the buildings and plant is shown in the following table:—Foundations, engine and boiler house, J. J. Shardlow, £3,500; structural steel work, E. C. & J. Key, Ltd., £5,800; corrugated asbestos sheeting for roof and walls, glazing, &c., £2,200; 6,000-kw. turbo-alternator, with condensing plant, £27,000; three boilers with superheaters, chain-grate stokers, chimneys, induced draught fans, &c., Babcock and Wilcox, Ltd., £17,000; coal-handling plant, overhead telephage system, Herbert Morris, Ltd., £3,500; ash-handling plant, £50; overhead crane for engine house, £600; steam, feed and water pipe work, including valves, £5,300; cooling towers, including foundations, Davenport Engineering Co., £5,550; fire appliances, £60; lagging for steam and feed pipes, £160; hotwell feed water tank and connections, £500; engine-room platforms, £200; railway siding, £3,000; high-tension switchgear and cable connections, £5,000; wharf extension, £3,000; contingencies, 10 per cent., £8,240. Total, £90,660. The cost of the underground trunk and distributing mains that will be necessary is estimated at approximately £50,000. If it should be necessary to install economisers there will be an additional expense for economisers and foundations of £2,000. The items of plant against which makers' names are given are those for which tenders have been obtained and submitted to the controlling authority.

Carlisle.—Owing to the heavy rains, the Corporation electric light station was flooded on Friday last, causing a temporary cessation of the electric lighting.—*Times*.

Canada.—The Hydro-Electric Power Commission of Ontario has extended the power plant at South Falls, Muskoka River, by the addition of a 750-k.v.a. unit; the extension will supply the towns of Gravenhurst, Bracebridge and Huntsville. —*Canadian Engineer.*

According to an American Consular report, the plant capacity of the Calgary municipal electrical undertaking is 15,000 k.w., the plant consisting of turbine and reciprocating sets with gas fired boilers. At the present time, however, the Calgary Power Co., is supplying the city under a bulk contract, from its hydro-electric plants on the Bow River, 58 miles away, and using the city's power plant as a stand-by unit. The city distribution is at 2,300 volts, three-phase, by means of 233 miles of pole line; the consumers' secondary feeders are single-phase, three-wire, at 110 and 220 volts and three-phase, 220 volts, for power. Some 11,000 meters are in service and 200 miles of streets are electrically lighted. The department is in a prosperous financial position.

Chelmsford.—**E.L. PURCHASE.**—The T.C. has decided to apply for an order under the Special Acts (Extension of Time) Act, 1915, extending for one year the time within which the Corporation may exercise its option to purchase the local electric light undertaking. In 1894 the B. of T. granted Messrs. Crompton and Co. a provisional order, and the present undertakers are the Electric Supply Corporation, Ltd.

Dublin.—When the chairman of the Lighting Committee recently moved the adoption of a report recommending the Committee's amalgamation with the Electricity Supply Committee, an amendment was moved by Mr. P. T. Daly for deferring the report pending the report of a Special Committee investigating the affairs of the electricity undertaking, and this was agreed to. By 37 votes to 14, the Corporation adopted a report of the Electricity Committee on the charges for electrical energy supplied to theatres.

Erith.—The U.D.C. on December 29th decided to grant a supply of current to the West Kent Electric Co. for a further 200 houses in Colyer's Lane. The electrical engineer has been authorised to install, at a cost of £60, a new centrifugal pump.

Fitchley.—**E.L. FAILURE.**—The electrical engineer, reporting upon the recent breakdown of the mains, said that this was the first occasion on which the supply of current had been completely disorganised since 1903. Each of the three main areas of supply was affected, and there were numerous minor faults on consumers' premises. The breakdown had partially damaged the large generating set. The major fault was due to a pick hole in one of the distributing mains, and the engineer is of opinion that all street openings should be under supervision, as similar damage had been done on several occasions. The engineer spoke highly of the manner in which the staff and men worked to clear the breakdown. The suggestion with regard to the supervision of future excavations was adopted by the Council.

Halifax.—**PROPOSED LOAN.**—The Corporation proposes to apply to the L.G.B. for power to borrow £5,558, the additional cost in connection with the purchase of plant required at the electricity works.

The General Purposes Committee has referred to the Electricity Committee a request for an advance of wages by the employees of the electricity department.

Hereford.—**LOAN REFUSED.**—The L.G.B. has refused the application of the T.C. for sanction to a loan for additional plant at the electricity works on the ground that the matter is not one of pressing necessity. The Council, in consequence, will not entertain for the time being any applications for new supplies, nor any extension of any existing supply.

Heston and Isleworth.—**ELECTRICITY PRICES.**—The Electricity Committee has again decided to retain the present price of current, as in view of the probable falling off in the quality of gas, owing to the extraction of constituents for manufacturing purposes, the undertaking would be likely to reap the benefit of an increased demand.

Leamington.—A sum of £300 is to be spent on X-ray apparatus and an electrical installation at the Warneford and South Warwickshire Hospital.

Leicester.—**PLANT EXTENSIONS.**—Having received numerous applications for increased power supply from manufacturers, the Electricity Committee recommends the Council to sanction an expenditure of £14,000 for the immediate provision of cables and for anticipated requirements, for which official approval will be given.

Lincoln.—**PRICE INCREASE.**—The T.C. has decided to increase the accounts of all ordinary consumers for lighting and power by 20 per cent. from the completion of the meter readings for the Christmas quarter's accounts.

London.—**BETHNAL GREEN.**—The Electricity Committee of the B.C. has had under consideration the question of the method to be adopted in dealing with the mains and services laid by the Shoreditch B.C. in the Bethnal Green area. The Shoreditch Council has from time to time during the past 12 years laid mains and services, some of the work being undertaken on the understanding that the Bethnal Green authority would, when in a position to supply current, purchase the mains of the Shoreditch

Council, whilst other works have been carried out by the latter authority in the absence of objection on the part of the Bethnal Green authority. The Committee recommends the Council to authorise it to negotiate further with the Shoreditch Council for the purchase of the mains and apparatus in order that the matter can be settled promptly.

Manchester.—**LOAN SANCTION.**—Sanction has been received for the borrowing of £8,250, repayable within 60 years, for the purchase of certain lands required in connection with the scheme for the establishment of an electricity generating station at Barton.

Paisley.—**YEAR'S WORKING.**—For the year ended May 15th last, the Corporation electricity undertaking earned a gross revenue of £25,908 and a gross profit of £11,072, and after meeting the usual financial charges and taxes, a surplus remained of £446, as compared with £395 in the previous year. The units sold during the year amounted to 4,036,611, which included 1,703,128 units supplied to the Paisley District Tramways Co., and 1,428,000 units supplied for power purposes. The output sold compares with 3,839,857 units for 1914.

Salford.—**PROPOSED LOAN.**—The Electricity Committee has decided to recommend the Council to apply to the L.G.B., for sanction to borrow £1,600 for a 500-k.w. rotary converter set, together with the requisite switchgear and low-tension cable.

Southend.—**L.G.B. SANCTION.**—The L.G.B. has sanctioned the loan for the provision of engines at the Leigh and Thorpe Bay sub-stations, on the understanding that the Corporation will endeavour to dispose of the machinery and will not fix the same without the Board's consent. A further communication is to be made to the Board on this matter.

Stalybridge.—**LOAN APPLICATION.**—The Joint Board has decided to apply for sanction to the borrowing of a sum not exceeding £20,000 for an extension scheme at the generating station to meet the increasing demands for energy. It is proposed to install another turbine set.

West Bromwich.—**LOAN SANCTION.**—The Electricity Committee of the T.C. has obtained sanction to borrow £8,850 for the extension of generating plant as follows:—£1,759 for economiser, steel chimney, motor for stoker and water softener; £4,517 for boiler machinery, &c.; and £2,574 for engine house extension and for foundations for boilers, chimneys, &c. The Committee recommends the entering into of an agreement with the Oriental Tube Co. for the supply of current of a minimum quantity of 80,000 units per annum.

Wharfedale.—**E.L. SCHEME.**—In regard to the scheme of various Wharfedale District Councils, with a view to the establishment of a joint electricity supply undertaking, it appears that the Otley and Burley Councils have suddenly withdrawn without attending a meeting of the joint committee to intimate their intention. In a report from the Wharfedale Electricity Sub-Committee, presented to the Gaisley Council, it was suggested that providing there was a unanimous desire on the part of the Councils concerned to allow a private company to come into the district it would be advantageous if each Council had a similar agreement with such company. Dr. Muschamp, the originator of the joint scheme, said a tentative scheme had been drawn up, with a recommendation that each Council should take a census with the object of ascertaining what demand there would be for electricity. The scheme must remain in abeyance at present because the Board of Trade had clearly intimated that it would not grant any order to any company during the period of the war.

Whitstable.—At a special meeting of the U.D.C. on December 28th, it was reported that the debenture-holders of the local Electric Supply Co. had appointed a receiver. A resolution was passed to the effect that the Council should only continue generating current in the usual manner until January 7th, unless on or before that date the debenture-holders stated their willingness to reconvene the Council for all expenses incurred.

York.—**DEFERRED EXTENSIONS.**—The Electricity Committee has recommended the T.C. to apply for an extension of time for the laying of mains in the Bishopthorpe and Acomb districts under the 1914 order.

TRAMWAY and RAILWAY NOTES.

Aberdeen.—**TRACK MAINTENANCE.**—Some discussion is likely to arise in the T.C. regarding a proposal emanating from the Tramways Committee that the maintenance of the tramway track should be handed over to that department.

Belfast.—**FEMALE LABOUR.**—At the meeting of the Corporation, on Monday last, Alderman Tyrell, of the Electrical Committee, in reply to a Labour protest against the employment of women as conductors on the trams, said that, if it was necessary to employ women, it would be done. Some discussion followed on the age of conductors, which had been reduced from 19 to 17 years, and also on a recent electrical explosion in one of the streets.

Blackpool.—**CONTRACT TICKETS.**—The T.C. on Tuesday last had another long debate on the question of tramway contract prices. The tramways manager recently reported that the existing charge of £3 per annum for the entire system was resulting in a loss of about £2,000 a year to the department, but the General Purposes Committee last week supported a recommendation that any change should be deferred until after the war.

Ald. Grime submitted that the Council should settle the matter at once by raising the price to £5. The amendment was defeated, so that the existing charges will remain in force.

Bradford.—**FEMALE LABOUR.**—Over 300 applications have been received for the 20 posts of women car conductors which have been decided upon by the Tramways Committee as an experiment.

During the storm of Saturday last a double-decked tramcar was blown over in Idle Road, the two passengers receiving slight injuries.

Canada.—Thirty Ontario municipalities have endorsed the proposal to construct an electric railway from Toronto to London (Ontario), at a cost of £2,800,000.—*Morning Post.*

Colne.—The T.C. has refused to accede to a request by the Tramway Workers' Union that the advance of 5 per cent. which the Council made at its last meeting, should be regarded as permanent, and not as a war bonus.

Erith.—The U.D.C. has decided to apply for a prov. order to alter or amend the Tramways Improvement Act, so as to enable the Council to run motor-buses in certain districts.

Glasgow.—**TRAMWAY ACCIDENT.**—On Saturday last an accident occurred to one of the Corporation electric cars, which left the rails at a sharp curve, and crashed into the wall of the Forth and Clyde Canal. The force of the collision caused the upper portion of the car to become separated from the lower, and to hang sideways against the wall. Over 40 passengers were on the car, and several were badly injured, including the woman conductor, the most serious cases being removed to the Western Infirmary.

Leeds.—**NEW TRAMWAY OFFICES.**—The Corporation tramway department moved during several days last week from its old premises in City Square to a new building at the corner of Lower Briggate and Swingate. The new headquarters are to be shared by the Highways department, and the estimated cost of the place is £30,000. A new headquarters has long been urgently needed, the growth of the tramway system having been very rapid in the last 15 years.

Preston.—The Tramway Committee, after considering a statement of receipts, has declined to discontinue the Sunday morning car service. Girls are to be employed for the tramway parcel delivery service.

Manchester.—The B. of T. has extended for one year the time limited by the Manchester Corporation Act, 1911, for the construction of, certain authorised tramways within and beyond the city.

Radcliffe.—**ACCIDENT.**—Nine persons were slightly injured on Monday in a tramway accident. Harry Pusey, the driver of the car, was driving down Radcliffe New Road, at about eight miles per hour, and when he tried to apply the brakes, about 200 yards from the bottom of the decline, the wheels began to skid. He applied other brakes, but the car gained speed, collided with a lorry, and ran off the track into a shop-front.

U.S.A.—**CHICAGO ELECTRIFICATION REPORT.**—The long-awaited report of the "Chicago Association of Commerce Committee of Investigation on Smoke Abatement and Electrification of Railway Terminals" has at last been made public. It contains some 1,200 pages, and apparently comes to the conclusion that railway electrification would have a negligible effect in reducing smoke pollution, and that if carried out, the railways would have to meet an estimated annual loss of over 14 million dollars on the undertaking. The electrification of every mile of track in the city would involve 3,476 miles, 1,476 miles being main line, and affect 38 railroads.

The Committee in estimating the cost of electrification considered several systems, and found comparatively little difference in cost. The least costly scheme was an 11,000-volt single-phase trolley system (\$178,000,000); a 2,400-volt direct-current trolley system was estimated to cost \$191,000,000; and a 600-volt d.c. third-rail system \$198,000,000, but this system was regarded as impracticable on account of the number of gaps in the third rail, while the overhead trolley system would be hampered by the number of structures across the track. The estimated annual deficit arises from the burden of annual charges to be met, electric working being in itself cheaper than steam operation. Steam locomotives were found to be responsible for only 10 per cent. of the gaseous pollution of the air, and it was considered that electrification would reduce the visible smoke in the city by only 20 per cent. As pointed out by an American contemporary, the extent of this smoke nuisance to the city at large may be of minor importance, but its concentrated nature in certain localities may have an important bearing on the matter.

One result of the publication of the report has been a unanimous decision of the Chicago City Council instructing the Council's Committee on railway terminals to consider immediately the electrification of the steam railways within the city, and report as to the necessary ordinances to bring this about—the Council thus ignoring the findings of the Chicago Association of Commerce.

The engineers to the Boston Elevated Railway Co. have recommended the addition of a 35,000-kw. turbine set to the South Boston station, which contains three 15,000-kw. turbo-generators. The engineers point out that while a 20,000-kw. set would provide sufficient power to meet reasonable demands temporarily, the larger unit would cost considerably less per kw. and be more efficient. It is estimated that the additional cost (\$200,000) would be repaid within five years by these savings. With an estimated five years' output of 1,180,000,000 units, the manufacturing costs are estimated at \$3,200,000 with the larger set, and at \$200,000 more for the smaller set; the use of the latter machine with its less steam consumption would also defer the necessity for additional boilers for one year beyond the time if a 20,000-kw. set were installed. The engineers also mention the tendency towards higher boiler pressures, it being considered practicable to build equipment for 400 lb. per sq. in. or more. The Boston Co. is rearranging its sub-station plant and substituting 1,000-kw. rotary converters for smaller units.

TELEGRAPH and TELEPHONE NOTES.

Ceylon.—According to *Indian Engineering*, the wireless equipment of Ceylon has been so much improved that the Island can now receive messages from Paris and Cornwall.

Postal Telegraphists.—It has been arranged with the War Office that no Post Office servant who has been attested shall be called up until the Postmaster-General has intimated that arrangements can be made for his release. Telegraphists and skilled workmen included in the revised waiting list for the Royal Engineers will not be called up with the groups into which they fall, but will be retained in their civil positions until they are required for enlistment in the Signal Service.

Russia.—"Urgent" telegrams to Russia at the rate of 1s. 1½d. per word were instituted on January 1st. These telegrams have priority over other private messages.

Switzerland.—According to official reports, the Swiss telegraph and telephone network had, at the end of 1913, an extent of 10,389 km. The telegraphic traffic during 1913 increased to 6,140,526 telegrams (an increase of 182,512 messages). Telephone subscribers totalled 80,517, the wire serving them being 336,419 km. in extent. The interurban circuits and international circuits had a total length of wire of 65,099.8 km. The number of conversations was 73,733,935. The aggregate of receipts totalled 21,182,715 fr.; expenses were 20,016,955 fr. The profit was, consequently, 1,165,760 fr.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—January 19th. P.M.G. Carbon and manganese powder, manganese chloride, chloride of ammonia, porous pots, outer jars and carbon blocks. See "Official Notices" to-day.

February 18th. Melbourne, Brunswick and Coburg Tramways Trust. Six radial trucks.

BRISBANE.—January 23rd. P.M.G. Wheatstone apparatus. See "Official Notices" Dec. 17th.

April 15th. P.M.G. Common-battery multiple switchboard, or automatic or semi-automatic switchboard, and associated apparatus. See "Official Notices" December 31st.

MELBOURNE.—February 16th: 51 electric staff instruments. February 23rd: Two commutator slotting machines, for the Victorian Railway Commissioners.

SYDNEY.—January 31st. Three electrically-operated railway freight-car transferers, for Jones Bay wharfe, Pyrmont. Particulars from Engineer-in-Chief of the Harbour Trust, Circular Quay.

January 20th. Silk-covered wire, for P.M.G.

February 7th. Metropolitan Board of Water Supply and Sewerage. For No. 1 pumping station at Ultimo. Two centrifugal pumps and electric motors (4,000 gallons per minute each), switchboards, starters, &c. Contract No. 1,301.

February 28th. Municipal Council. Tenders for induction regulators. Specifications (11s. 6d.) from the Electric Light Department, Town Hall, Sydney.

May 3rd. N.S.W. Railways and Tramways Department. One 2,500-kw. turbo-alternator, for Zara Street, Newcastle, power house. Specifications (20s.) from the Engineer's office, 61, Hunter Street, Sydney.

Darlington.—January 12th. Corporation. Coal bunkers, elevators, &c., for the electricity works. Specifications from the Borough Electrical Engineer, Haughton Road.

Dublin.—January 12th. Port and Docks Board. Twelve months' supply of electrical supplies. Forms from Mr. N. Proud, Secretary, Port and Docks Office, Westmoreland Street.

Leeds.—January 15th. Electricity Department. Steam coal (small slack, smudge or similar material) during the period ending July 31st or December 31st, 1916. Mr. C. N. Heford, City Electrical Engineer, 1, Whitehall Road.

London.—**ISLINGTON.**—January 21st. B.C. Twelve months' supply of engine-room stores, electrical fittings, meters, cables, &c. See "Official Notices" Dec. 31st.

New Zealand.—**AUCKLAND.**—February 23rd. City Council. Centrifugal pumping electric motors, and automatic starting and controlling apparatus, for the four city pumping stations. Specifications from the office of the Water Board, Town Hall, Auckland.

DUNEDIN.—May 17th. City Council. (1) Tramcar bodies; (2) electrical equipment. Plans, &c., from the Town Clerk, Dunedin.

RAETHIL.—March 14th. Town Board. 40-h.p. hydro-electric generating set, switchboard, &c. Plans and particulars from Messrs. H. W. Olimie & Son, Raethil.

South Africa.—January 17th. S.A. Railways Administration, Johannesburg. 74,966 drawn-wire tungsten lamps.*

Spain.—Tenders have just been invited by the municipal authorities of Puerto de Bejar (Province of Salamanca) for the concession for the electric lighting of the town during a period of 20 years.

The municipal authorities of Bodon (Province of Salamanca) have lately invited tenders for the concession for the electric lighting of the town during a period of three years.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Aberdeen.—The Corporation Tramways Committee has accepted tenders for ironwork and supplies of wood from Messrs. Cruickshank & McIntyre, Ltd., and Messrs. John Fleming & Co.

Australia.—The Brisbane Hospital Committee has accepted the tender of the Brisbane Electrical Co., at £3,852, for the installation of electric light and power.

The Sydney Harbour Trust has accepted the tender of Messrs. Gibson, Beattie & Co. for six electric wharf capstans, for Pyrmont.

—Tenders.

Bristol.—The Corporation Electrical Committee has accepted the tender of the East Bristol Collieries, Ltd., for a six months' supply of coal to the Avonbank works. The estimated amount is £11,540.

Grimsbj.—The Electricity Sub-committee recommends the purchase of the following coals from Messrs. Ed. Bannister and Co., Ltd.:—

260 tons of Broadsworth nutty slack, at 15s. 6d. per ton, to be delivered during January.

5,000 tons of Sherwood slack, at 12s. 4d. per ton, to be delivered during the next 12 months.

Keighley.—The Tramways Committee has recommended the acceptance of the tender of Messrs. Clough, Smith & Co., Ltd., to construct the overhead equipment for railless trolley vehicles from the present terminus at Hebden Road, Haworth, to Lower Town, Oxenhope, the capital payment to be suspended until after the war.

Leicester.—The Electricity Committee recommends the Council to seal the following contracts:—

Siemens Bros. Dynamo Works, Ltd.—An additional 1,000-kw. rotary converter and switchgear cables, &c., at £2,450.

British Electrical Transformer Co., Ltd.—One set of 100-kw. transformers, one spare transformer, one 75-kw. single-phase transformer, and one 50-kw. single-phase transformer, at £232.

G. Fletcher & Co., Ltd.—Additional coal-handling plant, at £1,952.

London.—**L.C.C.**—The following tenders have been accepted by the L.C.C. for the supply of electric lamps:—

Corona Lamp Works, Ltd.—Items 8-13, 18-21, and 26 (metallic-flament lamps, with patents of drawn wires).

Cryseco, Ltd.—Items 2-7 (metallic-flament lamps, with filaments not of drawn wire).

Edison & Swan U.E.L. Co., Ltd.—Items 1-7 (carbon-flament lamps).

Manchester.—The Electricity Committee has accepted the following tenders:—

One set of induced draught plant.—Musgrave & Co., Ltd.

One steam-turbine-driven boiler feed pump.—Worthington Pump Co., Ltd.

Two electrically-driven circulating water pumps.—Mather & Platt, Ltd.

Coal-conveying plant.—Babcock & Wilcox, Ltd.

Water cooler.—Klein Engineering Co., Ltd.

Railway track and crossing.—Marple & Gillett, Ltd.

Steelwork required in boiler house No. 2.—Francis Morton & Co., Ltd.

Fountains for new cooling towers and boiler house No. 3.—F. Mitchell and Co., Ltd.

Periodical inspection and insurance of two boilers and economisers.—National Boiler & General Insurance Co., Ltd.

Length of ozone-proof cable.—Fittell-General Cable Works, Ltd.

Salford.—The Electrical Committee has accepted the following tenders:—

500-kw. rotary converter set.—British Westinghouse Co., £1,450.

4-ton Albion motor petrol wagon.—Albion Motor Car Co., Ltd., £775.

The Tramways Committee has accepted the tender of Messrs. Hadfields, Ltd., for 14 manganese-steel crossings, at £292; and the offer of Messrs. Brown, Bayley's Steel Works, Ltd., for 300 steel tramcar tires, at £4 10s. 9d. per tire.

West Bromwich.—The following tenders for the supply of plant have been recommended by the Electricity Committee for acceptance:—

Gwynnes, Ltd.—Motor-driven centrifugal pump.

Kennicott Water Softener Co.—Water softener.

Cochrane & Co., Ltd.—C.I. pipes.

Babcock & Wilcox, Ltd.—High-pressure steam pipe.

FORTHCOMING EVENTS.

Greenock Electrical Society.—Friday, January 7th. At 7.15 p.m. At the Temperance Institute, West Pier Street. Paper on "The Economy of Electricity in a Small Household," by Mr. W. B. Smith.

Electro-Harmonic Society.—Friday, January 7th. At 8 p.m. At Holborn Restaurant. Smoking concert.

Manchester Association of Engineers.—Saturday, January 8th. At Grand Hotel, Aytoun Street. Paper on "The Importance of Uniform Conditions for Engineering Operations and Industrial Work," by Mr. A. Etchells.

Institution of Civil Engineers.—Tuesday, January 11th. At 5.30 p.m. At Great George Street, Westminster. Paper on "The Electric Locomotive," by Mr. F. W. Carter.

Illuminating Engineering Society.—Tuesday, January 11th. At 8 p.m. At the Royal Society of Arts, John Street, Adelphi. Discussion on "Some Principles in Industrial Lighting (with special reference to the first Report of the Departmental Committee on Lighting in Factories and Workshops)" to be opened by Mr. J. S. Dow.

Institute of Marine Engineers.—Tuesday, January 11th. At 7 p.m. At Tower Hill, E.C. Paper on "Power-driven Tools on board Ship," by Mr. J. Hamilton Thomson.

Liverpool Engineering Society.—Wednesday, January 12th. At the Royal Institution, Colquhoun Street. Paper on "Marine Refrigeration," by Mr. J. Wemyss Anderson.

Association of Engineers-in-Charge.—Wednesday, January 12th. At 8 p.m. At St. Bride's Institute, Bride Lane, E.C. Paper on "Limit Gauges and their Application," by Mr. W. H. Booth.

Institution of Electrical Engineers.—Wednesday, January 12th. At 8 p.m. At Victoria Embankment, W.C. Paper on "The Predetermination of the Performance of Dynamo-electric Machinery," by Prof. Miles Walker.

(**Newcastle Local Section.**)—Monday, January 10th. At 7.30 p.m. At the Mining Institute. Paper on "The Design of High-pressure Distribution Systems," by Mr. J. R. Baard.

(**Scottish Local Section.**)—Tuesday, January 11th. At 8 p.m. At 207, Bath Street, Glasgow. Paper on "Distribution and Rise of Temperature in Field Coils" (part I), by Prof. M. Maclean and Mr. D. J. Mackellar.

(**Manchester Local Section.**)—Tuesday, January 11th. At 7.30 p.m. At the Engineers' Club, 17, Albert Square. Paper on "The Predetermination of the Performance of Dynamo-electric Machinery," by Prof. Miles Walker.

(**Birmingham Local Section.**)—Wednesday, January 12th. At 7 p.m. At the University, Edmund Street. Paper on "The Predetermination of the Performance of Dynamo-electric Machinery," by Prof. Miles Walker.

(**Yorkshire Local Section.**)—Wednesday, January 12th. At 7 p.m. At the Philosophical Hall, Leeds. Paper on "The Design of High-pressure Distribution Systems," by Mr. J. R. Baard.

Chemical Society.—Thursday, January 13th. At 8 p.m. At Burlington House, Piccadilly. W. Ordinary meeting.

NOTES.

Bristol Corporation and Enemy Goods.—At a meeting of Bristol City Council on Saturday a resolution was passed requesting the Corporation Committee to avoid as far as possible trading with firms containing Germans or German capital. It was suggested that Sir W. H. Davies, M.P., who was present, should draw the attention of Parliament to such trading by Government departments.—*Times*.

The City Council had a lengthy discussion on the matter a few days ago, the question being raised with reference to a contract for main cable for the Royal Edward Dock placed with Messrs. Siemens Bros., Ltd. Alderman Pearson, who was the principal speaker, said that whether the works were under Government control or not it did not affect where the profit went. If the profit went into the hands of the public trustee he was of opinion that it would largely go to Germans when the war was over, and at the end of the war it would be used to bargain with Germany, and Germany would get it directly, or as a set-off. Alderman Pearson went on to give illustrations of the way in which relatives and friends of his own, Englishmen, who had been in control of businesses in Germany up to the outbreak of war, were being treated in Germany—living either in gaol or in horse boxes. He proposed:—"That all Committees of the Council be instructed, when placing orders, to avoid any business which is enemy-owned or is managed or worked directly or indirectly by or under the influence of enemy subjects, or is carried on wholly or mainly for the benefit of or on behalf of enemy subjects, notwithstanding that the firm or company may be registered or incorporated within the King's Dominions." After discussion, in the course of which it was shown that the firm had supplied machine, and unless they were to be allowed to replace parts in case of breakdown it might be very awkward, also that they were patronised by the Government, and had supplied war materials to the Government, Alderman Pearson wished to add the words "as far as possible." He said that it was his idea that they should go to Messrs. Siemens when it was absolutely necessary. The resolution as amended was agreed to. A report of the discussion will be found in the *Bristol Times and Mirror* for January 3rd.

Institution and Lecture Notes.—**Institution of Electrical Engineers.**—The Council has decided that during the war any candidate for admission as Associate Member who is engaged on naval or military service, or employed (whole time) in an engineering capacity on munitions or other war work, shall be exempted from complying with the examination regulations, and any such service may be accepted in part fulfilment of the conditions laid down with regard to experience, provided that in other respects the candidate satisfies the requirements as to age and training.

The Council has asked the National Service Committee of the Institution to formulate a scheme for giving to disabled sailors and soldiers a preliminary training as switchboard attendants, &c., and for obtaining means to carry on this work and arranging for the selection and distribution of applicants for positions.

The following local hon. secretaries and treasurers have been appointed:—Mr. H. Hastings, for Spain; Mr. A. C. Kelly, for Argentina; Mr. W. M. L'Estrange, for Queensland.

The following arrangements are announced for meetings to be held in London between now and May:—

January 18th.—Prof. Miles Walker, "The Predetermination of the Performance of Dynamo-Electric Machinery."

January 20th.—H. H. Harrison, "The Principles of Modern Printing Telegraphy."

February 10th.—O. L. Record, "The Testing of Underground Cables with Continuous Current."

February 17th.—C. Chree, D.Sc., F.R.S., "Terrestrial Magnetism." (The seventh Kelvin Lecture.)

March 9th.—E. V. Pannell, "Continuous-current Railway Motors."

March 16th.—N. W. Storer, "The Possibilities in the Design of Continuous-current Traction Motors."

April 18th.—(To be announced later.)

May 11th.—Annual General Meeting.

Fatalities.—At Manchester on Tuesday an inquest was held on Henry Wharton, aged 17 years, who had been employed at a Manchester munition works. Deceased was being instructed in the work of driving an overhead crane. On December 31st he appeared to have left the cabin of the crane (although he had no need to do so), and he was seen with his hand on a "live" wire well above the cabin. He fell to the ground and died later. "Accidental Death" was the verdict.

At the adjourned inquest at Eastbourne in connection with the death from electric shock of two men who attempted to render assistance to a motor-car which collided with and smashed a 2,500-volt switch pillar on December 26th last, the jury returned a verdict of "Death from Misadventure," adding a suggestion that such boxes should be further from the side of the road. Mr. A. P. Trotter, electrical adviser to the Board of Trade, represented the Board at the inquiry.

On Tuesday last, Arthur Walker, an electrician at Skinningrove Ironworks, slipped into some gearing, receiving injuries which necessitated the amputation of a leg.

For Sale.—Messrs. Percy Huddleston & Co. will sell by auction without reserve, at 158, Falcon Road, Clapham Junction, S.W., on January 13th, a 230-volt motor, motor fans, arc lamps, cables, wires, &c., of which some particulars are given in our advertisement pages to-day.

Appointments Vacant.—Shift engineer (£130), for the City of Birmingham Electric Supply Department; electrician (50s.), for the Abertillery U.D.C.; assistant electrical engineer (£130), for the Government of Malta Electric Lighting Department. See our advertisement pages to-day.

Volunteer Notes.—ENGINEERING INSTITUTIONS' VOLUNTEER ENGINEER CORPS.—Orders for week commencing January 10th, 1916.—By Lieut.-Col. C. B. Clay, V.D., Commandant.

Drills, 6.25 to 7.25; 7.25 to 8.25 p.m.
Monday, January 10th.—Sections 1 and 2, Technical; Sections 3 and 4, Squad, Signalling Section and Recruits.

Tuesday, January 11th.—School of Arms, 6 to 7 p.m.
Thursday, January 13th.—Shooting for Sections 1 and 2, and Signalling Section.

Friday, January 14th.—Sections 3 and 4, Technical; Sections 1 and 2, Squad, Signalling Section and Recruits.

Saturday, January 15th.—Uniform Parade. Time and place will be posted at Headquarters later.

E. G. FLEMING,
Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON REGIMENT (VOLUNTEERS).—Battalion Orders by Captain R. J. C. Eastwood (Sub-Commandant), Thursday, January 6th, 1916:—

Captain of the Week.—Mr. C. F. Holland.
Orderly Officer.—Mr. F. Owen.

Week-end Parades.—Saturday.—A, B and D Companies will parade at Baker Street Station at 2.30 p.m. and proceed by train to Willesden, where they will detain, and proceed by march route to Wembley Park. C Company will parade at the same time at Baker Street Station, and proceed direct to Wembley Park by train.

Sunday.—Field Day.
The Battalion will parade at King's Cross (G.N.R.), at 9.30 a.m. sharp, and proceed by train to Potter's Bar. Members will make their own arrangements for lunch. Hot tea (without food) will be provided at 3.30 p.m., and members are advised to bring their own drinking cups. The Battalion will entrain at Potter's Bar for the return journey at 4.40 p.m. A sketch of the ground, by Mr. Marples, will be issued to all Company Commanders.

Musketry.—Inter-Platoon Competition.—Acton Range will be open on Saturday next, the 8th inst., for practice for above competition, only for those men who have sent their names in to the Musketry Staff. Parade in Uniform, at Acton Range, at 2 p.m. punctually.

A. G. JOINER, Major and Adjutant, O.B.C.

British Trade in China.—A Reuter dispatch from Shanghai says that a Chamber of Commerce has been formed embracing the whole of China. It is issuing journals in English and Chinese, and is receiving most valuable co-operation from the Consular officials. The Chamber of Commerce Journal announces the formation of a school to teach the Chinese language to Englishmen. Shanghai is at present in the throes of a rubber boom.

Inquiry.—Makers of electrical conduit bearing the mark of a thistle are asked for.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—Mr. PERCY LANE, mains assistant at the Finchley electricity works, has tendered his resignation.

The Leeds Electricity Committee has recommended the City Council to advance the salary of Mr. C. N. HEFFORD, engineer and manager of the undertaking, from £600 to £800 per year.

Mr. J. B. FELTHAM, chief assistant at the Gloucester Corporation electricity works, has been appointed electrical engineer to the Mexborough U.D.C.

The Manchester Electricity Committee has decided to recommend that Mr. A. E. McKENZIE, chief assistant engineer, be appointed deputy chief engineer at a salary of £700 per annum, rising by annual increases of £50 to £800 per annum as the maximum.

The National Electric Construction Co. have appointed Mr. H. C. BABB to be engineer and manager of their electricity works at Bo'ness, in succession to Mr. Rogers. Mr. Babb went to Bo'ness from Hawick, where he acted as chief technical assistant to the Edmundson's Electricity Works. On leaving Hawick recently he was presented with a case of pipes.

Mr. J. E. M. STEWART, chief assistant engineer in the Leicester electricity department, has resigned his appointment in consequence of ill-health. The engineer has been authorised to obtain the services of an assistant at a salary of £300 per annum.

Mr. T. S. WARTERS has resigned his position as shift engineer at the Regent's Park station of the St. Pancras Borough Council.

General.—Mr. A. VINES (formerly Schneider), a British-born subject, a managing director of Messrs. Evershed & Vignoles, Ltd., has by deed poll, dated December 31st, 1915, abandoned his former surname of Schneider and adopted and will use henceforth his mother's maiden name of Vines.

Mr. H. G. W. HASLETT, of Messrs. Haylock & Haslett, joined the London Electrical Engineers early in October last, and is now engaged in coast defence work with that corps. A dissolution of partnership has been deemed advisable, which will date from January 1st, 1916. The business will be continued under the original title of Ralph H. Haylock & Son.

Mr. WALTER TOWERS, lately mechanical engineer at Stirling Corporation electricity station, has obtained an important appointment at Rosyth Naval Base. Mr. Towers, who left Stirling about two months ago, offered his services to the Admiralty, who gave him a position at the Base, and he has since been promoted supervisor of the main power station. Mr. Towers was employed by the Stirling Corporation for 13 years.

Dr. WM. GARNETT, the well-known education authority, mathematician and physicist, retired from his position as Educational Adviser to the L.C.C., on reaching his 65th year, on December 31st.

In the *London Gazette* appointments there appear the following announcements:—December 15th, 1915. Admiralty; Electrical Engineer in H.M. Naval Establishments, Ernest Thomas Williams; December 17th, Richard Wightman.

The marriage took place at Hollingworth (Congregational Church), on December 27th, of Mr. WALTER AGUTTER, of the electrical staff of the D.P. Battery Co., Bakewell, and Miss M. Marshall, of Woolley Lane, Hollingworth.

The *Morning Post* states that Mr. E. MANVILLE, of London and Coventry, president of the Associated British Motor Manufacturers and Traders, has consented to serve as a member of the Board of Referees in connection with the excess profits duty.

It was announced in the *Times* last week that a marriage would shortly take place between Mr. HORACE FIELD PARSHALL, of Penbury Grove, Penn. Bucks, and Miss Ellen Dunlap Payne, daughter of Mrs. Gottrude Dunlap Payne and the late Frederick William Payne, of Boston, Massachusetts.

Mr. F. W. MOZLEY, eldest son of Mr. H. Mozley, the Burnley tramways manager, has enlisted in the Engineering Company of the London Regiment of Artists' Rifles. He is chief engineering assistant to the Burnley Corporation.

The daily Press states that Mr. G. W. J. PRAET, traffic superintendent, Bournemouth Telephone District, has been appointed superintendent of telegraph and telephone traffic in the Ceylon Post Office.

Major C. W. JORDAN, electrical engineer, of Cardiff, has just taken over the duties of Commandant of the No. 7 Area of the Western Command. In this area there are Lancashire, Cheshire and Manchester, as well as Glamorgan counties.

Roll of Honour.—Second-Lieutenant WILFRID C. HUNTER, R.G.A., who was killed in action on December 30th in Flanders, was, prior to the war, secretary of the Rugby Lamp Co., Ltd. It is only a few weeks since he took leave of his parents and friends in Rugby to proceed to the Front.

Warrant Telegraphist HARRY NOBLE, of the R.N.R., has received the Serbian gold medal for zealous service in the

war, the conferment having been made at the instance of King Peter.

Sapper ARTHUR E. PHILLIPS, signaller in the Royal Engineers, formerly an electrical engineer at Bradford, is on sick furlough at his home suffering from diabetes.

Private JAMES, of the 16th Lancashire Fusiliers, formerly employed at the Westinghouse Works, Trafford Park, has been killed by the explosion of a mine under a trench in France.

Private J. L. HOENE, of the 1/6th Battalion Manchester Regiment, who prior to the war was an apprentice electrical engineer at the Westinghouse Works, Manchester, and previously reported missing, is now reported to have been killed at the Dardanelles.

Sapper HARRY ASHCROFT, of the Gandy Palace Engineers, who has died in hospital at Rouen, France, from pneumonia, contracted whilst engaged on trench work, was until last March engaged as an electrician at Southampton.

Sapper TOM GRANTHAM, who has been wounded on three occasions, and is now home on leave from France, was prior to the war an electrician at Blackpool Tower.

Private ALBERT T. SCOTT, 3rd Buffs (East Kent Regiment), who is reported wounded and a prisoner of war, was on the staff at the power house of the Associated Portland Cement Manufacturers, Ltd., at Burham, near Maidstone.

Lance-Corporal CLAUD BANCROFT, of the 4th Battalion West Riding Regiment, who is in hospital at Sheffield suffering from serious injury to his ears through the bursting of a trench mortar, was engaged prior to the war as electrical engineer on board Mr. George Jay Gould's yacht *Atlantia*, which is now doing patrol duty in connection with the Navy.

The Salford Tramways Company has passed a resolution congratulating Sergeant SMETHURST, an employee of the Committee, on being awarded the D.C.M., and has given instructions for the resolution to be engrossed on vellum and presented to Sergeant Smethurst.

Will.—The late Dr. F. S. PEARSON, who was drowned in the *Lusitania*, left estate valued at £328,960 in the United Kingdom.

New Year Honours List.—In the New Year Honours list the following appear:—

Mr. D. A. THOMAS, of South Wales Colliery fame, who has lately rendered valuable assistance to the Ministry of Munitions by his visits to America, has the dignity of a Baroncy of the United Kingdom conferred upon him.

Mr. G. N. BARNES, M.P., formerly Secretary of the Amalgamated Society of Engineers, is to be sworn a member of the Privy Council.

Sir GEORGE BULLOUGH, of Messrs. Howard & Bullough, engineers, and Mr. A. F. YARROW, the shipbuilder, are made Barons.

Mr. GEORGE FRANKLIN, who was formerly chairman and managing director of the National Telephone Co., Ltd., is made a Knight, as are also Mr. H. F. LE BAS, of the Caxton Publishing Co., and Mr. R. A. ROBINSON, a former chairman of the L.C.C.

In the Colonial Honours list, COLLINGWOOD SCHREIBER, ESQ., C.M.G., general consulting engineer to the Government of Canada, becomes a K.C.M.G.

Mr. J. R. BOOSE, travelling commissioner for the Royal Colonial Institute, is made a C.M.G.

Mr. W. W. HOX, general manager of Railways and Harbours, Union of South Africa, and Mr. JOHN KENNEDY, consulting engineer to the Montreal Harbour Commission, each receive the honour of Knight Bachelor.

The Kaiser-i-Hind Gold Medal awarded for public services in India is given to Mr. W. S. SHARPE, Indian Telegraph Department, Superintendent of Telegraph Engineering, Bombay Division, and to Mr. H. J. H. GLENN, executive engineer, Province of Delhi.

NEW COMPANIES REGISTERED.

Temple Brothers, Ltd. (142,541).—This company was registered on December 24th, with a capital of £1,000 in £1 shares, to carry on the business of electricians, electrical, mechanical, motor, telephone, lighting, ventilation and general engineering, makers and repairers of and dealers in electrical and other fittings, telephones, indicators, fire alarms, lightning conductors, automatic time recorders, clocks, time switches, electrical, scientific, surgical, nautical, optical, and mathematical instruments, manufacturers of and dealers in gramophones, gramophones, gramophone records and gramophone sets. The subscribers (with one share each) are: J. Hamilton, London House, New London Street, E.C., mechanical engineer; A. J. Seward, London House, New London Street, E.C., superintendent engineer; Private London. The first directors (the number not more than five) are: W. J. Stewart (chairman) and J. Hamilton, Quinborough, £90. Remuneration, as fixed by the company. Secretaries: C. Crocker, 23, Abington Street, Westminster. Registered by Jordan & Sons, Ltd., 116-17, Chancery Lane, W.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Dick, Kerr & Co., Ltd.—Capital, £250,000 in £1 shares (350,000 paid). Return dated November 30, 1915: £90,000 profit, and 250,000 £1 shares taken up; £565,000 paid. Mortgage and charges: £331,665.

Bankfoot Power Co., Ltd.—A memorandum of satisfaction to the extent of £5,000 on September 30th, 1915, of debentures dated May 12th, 1911, securing £50,000, has been filed.

James Keith and Blackman Co., Ltd.—Issue, on December 20th, 1915, of £1,500 debentures, part of a series of which particulars have already been filed.

A memorandum of satisfaction in full on November 14th, 1915, of debentures dated February 20th, 1913, amounting to £1,200, has also been notified.

Northampton Electric Light and Power Co., Ltd.—Issue, on December 3rd, 1915, of 500 debentures, part of a series of which particulars have already been filed.

Buenos Aires City and Suburban Tramways, Ltd.—A memorandum of satisfaction in full on December 9th, 1915, of charges dated March 20th, 1911, and supplemental agreement dated September 10th, 1912, securing £61,000 and further advances up to £200,000, has been filed.

CITY NOTES.

British Columbia Electric Railway Co., Ltd.

The annual meeting was held on December 30th at the Great Eastern Hotel, E.C., under the presidency of Mr. G. P. NORTON. In the unavoidable absence of the Chairman (Mr. R. M. Horn-Payne) Mr. Hymett Brown, a director, read a speech which that gentleman had prepared. In this the CHAIRMAN said that British Columbia had unquestionably suffered from the effects of the war very much more acutely than any other part of Canada. A commercial paralysis had resulted which had produced so great a falling-off in the receipts of the company that it was probable it would not earn in the current year much more than sufficient to pay its debenture interest. Fortunately the year did not find the company in a weak position as regards cash resources, and by immediately cutting down capital expenditure to the utmost possible extent and enforcing the most rigid economy, the position had been still further strengthened, and the company was now in a position to withstand even the present acutely bad times although they should continue for several years. Unfortunately, as events had turned out, they had extended the tramway system and increased their equipment and power plants largely beyond the requirements of the business at present available, and had, therefore, for the time being, large amounts of capital unremuneratively employed. For instance, their systems of power plants on the mainland and Vancouver Island had cost \$13,475,000, and they were capable of producing about twice as much power as was required during the past year. The ordinary effects of the commercial depression had been greatly accentuated by the advent of an extraordinary form of competition in the jitney bus. With regard to the future of this competition, since the commencement of the winter rains there had been a considerable and continuous reduction in the number of jitneys operating, particularly in Vancouver. It was expected that this reduction would at least continue during the remaining winter months. What, however would happen in the spring, when the fine weather returned, it was difficult to forecast. The general manager held the opinion that they would not be troubled next summer with the jitney bus to the same extent as during the past summer. They had hitherto struggled to maintain a thoroughly efficient service throughout all the districts served by their cars, but should this jitney competition continue on an extensive scale, the company must cease to operate some of the outlying lines. At present the jitneys took the cream of the paying traffic in the more thickly populated centres, leaving the company to provide for the whole of the unremunerative business. It was impossible for the jitneys to supply the needs of the outlying districts at anything like the fares which the company charged, but if the people insisted upon supporting this unfair competition in the more thickly populated areas the company would have no alternative but to leave some of the outlying districts without travelling facilities. During the year every effort had been made to strengthen the company's friendly relations with the municipalities, and although the board had been compelled to refuse many requests involving expenditure of money, it was hoped that the municipal authorities were beginning to some extent to appreciate the company's difficulties, and that the interest and prosperity of the company and of the community were identical and inseparable, and this would undoubtedly be realised more and more after the war. The company's present position was extremely disappointing, but it was one that would right itself with the return of normal conditions. As the result of the wonderful crop, which was reliably estimated to produce to the farmers in the three prairie provinces alone no less than 400 million dollars, and of the stimulus given to every branch of manufacture by the increased spending power derived from it, and also from the large munition orders placed in Canada, a great revival of trade had taken place in the Eastern and Central Provinces, and would undoubtedly slowly extend to British Columbia. He might sum up the situation by saying that the company was suffering from what could only be described as tragically bad times, which had caused much suffering and had driven a quarter of the population out of the cities and had, incidentally, caused a greatly restricted use of the cars and of electric light, a reduction in the consumption of power by industrial enterprises, and had produced jitneys. He thought there was no

doubt that the worst was past. There was already a considerable improvement in the lumber trade, some increase in activity in mining, and the restoration of the Canadian Pacific steamship service to Japan and China was definitely announced, which afforded grounds of hopes of a more marked improvement when the winter was over. The Panama Canal and the Canadian Northern Railway across the continent to Atlantic tide water, both of which were completed in the last year, would prove most powerful factors in hastening the development of British Columbia on the return of normal conditions, and there was nothing in the situation which caused him to abate in the least degree his absolute confidence in the splendid future of the province, which could be hastened or retarded chiefly by the disposition shown by the people to treat capital with honesty and consideration or otherwise.

The CHAIRMAN formally proposed the adoption of the report, which was seconded by Mr. EVAN-THOMAS.

Replying to a shareholder, the CHAIRMAN said that with regard to the jitney competition, the board were of opinion that an ordinary motor-car could not possibly subsist for any length of time on the fares they were getting. It was, of course, possible that some form of vehicle would develop which would be a serious competitor with the trams, but up to the present the competition had come very largely from private owners who drove their own car and who were prepared to work inordinately long hours. The board had striven to get fair regulations for these cars, and he hoped they would succeed, but they had not been able to do anything up till now. As to the provision of £167,888 for renewals maintenance, the board thought it was in the best interests of the company that that provision should be continued as hitherto, and he might point out that it was only because they had put by such large sums in the past that the company was in its present very strong financial position.

The report was adopted.

Tata Hydro-Electric Co., Ltd.

THE directors, in their report to June 30th, 1915, state that in addition to the cotton and flour mills which have contracted to take supply from the company for a period of ten years, the company has entered into a contract with the Bombay Electric Supply and Tramways Co., Ltd., for energy required by them for two of their sub-stations, and the necessary plant for one of these has been ordered. The directors have authorised the investigation of new areas on the ghats for the extension of the present scheme to meet any prospective demand for energy. Suitable sites have been chosen, and the result of the investigations shows that considerable power will be made available on a highly satisfactory basis. The general manager reports as follows:—

The Walwhan dam was raised last season to a sufficient height to store water at full supply level. The work of completion is in progress. The water in this lake reached full supply level on September 10th, 1915. Water for power supply is being drawn from Lonavla lake since the commencement, and the lake now stands at only 4½ ft. below full supply level. The duct is nearing completion throughout. The Lonavla to Forebay section is in use, and the Walwhan section is being dressed, and is practically ready for service. The forebay work is practically completed. The sluice house, sluices, and all machinery are erected, and only a little finishing work remains. One water pipe line and five small lower pipe lines are completed for the original installation. The valve house at junction point 9 is under construction. The tunnel between Walwhan and Shiravata is complete except for a little trimming, and a quantity of excavation has still to be done in widening the approach cut. Work is proceeding on the Shiravata Dam, and a small quantity of water is stored which will be utilised for construction purposes. A temporary weir is constructed for a small additional storage for power purposes next year. The power house work for the four units is practically completed. With the satisfactory conclusion of the necessary revision work on the generators the whole apparatus of the original installation will be soon in full service. The transformers, switchgear, etc., are all in regular use and giving satisfactory service. The transmission line is in working order, and both circuits are available to their full capacity. The question of insulators for maintenance is receiving attention.

The receiving station plant is all installed for the four units and working satisfactorily. For improving the power factor of the system two synchronous condensers have been erected during the year. The workshop building is completed and brought into use. The underground cables so far put into service are giving satisfaction. The major portion of the erection work is completed. Mill equipments for all the mills of the original installation are received. Ten mills are completely equipped and receiving power. Seventeen mills are receiving power for partial requirements. Load is being added continuously with due regard to the convenience of the customers. Arrangements are now being made for night supply of energy. At present there are 27 mills with motors of the aggregate B.H.P. of 27,400 in service.—*Indian Textile Journal*.

Western Canada Power Co.—It is announced, says the *Times*, that this company will default in payment of the coupon payable on January 1st on its five per cent. first mortgage bonds. A committee has been formed in Canada to protect the interests of the bondholders.

South Wales Electrical Power Distribution Co., Ltd.—The directors, in forwarding warrants for the current half-year's interest on the original debenture stock, state that, although at the present time there is in hand a sum sufficient to pay the now current half-year's interest, the whole of that sum was not earned in the half-year, a part having been previously accumulated.—*Financier*.

Calcutta Electric Supply Corporation, Ltd.—The number of units sold to consumers during the four weeks ended November 26th, 1915, amounted to 1,709,366, compared with 1,075,864 in the corresponding four weeks of 1914.

Kaministiquia Power Co.—The directors have declared a dividend of 1½ per cent. for the quarter to January 31st, or at the rate of 6 per cent. per annum.

STOCKS AND SHARES.

TUESDAY EVENING.

The first week of the new year has witnessed a good deal of firmness through the Stock Exchange. Prices all round are good, notwithstanding the fact that the public are buying comparatively little. The strength of the Consol market is a noticeable feature. Home Railway stocks are decidedly better. The industrial sections are more or less overshadowed by further robust developments in rubber shares, prices in that particular section going ahead with daily persistence, in consequence of a steady advance in the price of the raw stuff.

The turn of the old year released money, as usual, in the way of dividends, and also from the banking accounts of those who still indulge in the practice of window-dressing. Several Colonial new issues are in the air, and one of them has already made its appearance, but without exerting any effect upon investment prices, though in more normal times they would probably have depressed the gilt-edged securities to some extent. There is so much money awaiting investment that prices are well maintained, and it would be a simpler task to write out the names of fifty first-class stocks of which there is no supply, than to catalogue a list of similar length giving the names of those which can be bought at the present time.

The Home Railway market is enjoying one of its periodical spasms of firmness. Most of the popular stocks are better, and a decided feature of the market is the buoyancy of Underground Electric Railway issues. The £10 shares, in particular, are strong; but the 6 per cent. income bonds have also advanced, and show a rise of 2½ on the week. The improvement is due to inquiry on behalf of investors, of whom a large number are buying quite small amounts of the stock. Metropolitan and Districts are both harder, and Central London stocks—out of favour for some time past—are now wanted.

Hundreds of ex-dividend markings have been made within the past ten days throughout the Stock Exchange lists. Anglo-Argentine Tramways preference shares, and one or two of the debenture stocks are now ex dividend, and the company's first preference shares, at 4, look tempting to the speculative investor. British Columbia Electric preference moved up a point to 61.

The Mexican group is weaker. A few thousand dollars of Mexico Tramway and Mexican Light & Power bonds are on offer, although definite news from the country is as scanty as ever. Brazilian Tractions show a slight recovery, hardening to 51½, while other foreign Tramway descriptions are fairly steady.

The Telegraph market is very firm. Anglo deferred moved up to 23. Western Telegraph debenture stock has recovered a point of the interest deducted from the price. Globe preference are a trifle easier at 10½. Marconis, now ex dividend, are quoted at 35s., and there is rather more disposition to deal in them again. The Heavy telegraph shares are all good, buyers predominating, and with very little floating supply on offer.

Home Electricity shares are no better. Illumination issues of all kinds are dull, gas stocks being weak equally with electricity supply shares. Westminster have further receded. St. James' ordinary are back to 6. The market is stagnant; and although occasional bargains take place in the leading shares, this section ranks amongst those which have been unfortunate enough to fail in securing any portion of popular support since the war broke out nearly eighteen months ago.

British Westinghouse preference are strong at 2, in consequence of favourable rumours with reference to the big profits which the company is making out of war work. Babcock and Wilcox have also advanced further. Callenders are a good market at 11½, showing a rise of 15s. on the week. India-Rubbers, at 8½, are ex their dividend, and once more look cheap.

The rubber market is the name to conjure with for the moment. That there is a temporary shortage of the raw material seems to be generally recognised, but without affecting the rush for rubber shares. Those engaged in the business are pressed to the uttermost in order to keep up with the activity, which one of them declared only the other day to be anomalous and contradictory, what time the country is at war. Nevertheless, the public insist upon buying shares, the support coming from all parts of the country. By every canon of tradition and precedent, there should be abatement of the fever before long, and not a few Stock Exchange men look for a halt to be called. Still, as long as the strength of the raw rubber market is so pronounced, the public are hardly likely to want to part with their rubber shares.

MARKET QUOTATIONS.

It should be remembered, in making use of the figures appearing in the following list, that in some cases the prices are only general, and they may vary according to quantities and other circumstances.

Wednesday, January 5th.

CHEMICALS, &c.	Latest Price.	For night's (inc. or Dec.)
a Acid, Hydrochloric	per cwt.	..
a " Nitric
a " Oxalic	per lb.	1 1/2
a " Sulphuric	per cwt.	..
a Ammoniacal Sal.	per ton	£20
a Ammonia, Murate (large crystal)
a Bleaching powder	£23
a Bisulphide of Carbon	£25
a Borax	£4 1/2
a Copper Sulphate
a Lead, Nitrate	30/- inc.
a " White Sugar
a " Peroxide
a Methylated Spirit	per gal.	..
a Potassium Bichromate, in casks	per lb.	..
a Potash, Caustic (88/90 %)	per ton	..
a " Chlorate	per lb.	1 1/2
a " Perchlorate
a Potassium, Cyanide (88/100 %)	Nom.
(for mining purposes only)
a Shellac	per cwt.	65/-
a Sulphate of Magnesia	per ton	£18
a Sulphur, Sublimed Flowers	£11 10
a " Recovered
a Soda, Caustic (white 70/72 %)	£8 10
a " Chlorate	per lb.	1 1/2
a " Crystals	per ton	15/- inc.
a Sodium Bichromate, casks	per lb.	8 1/2
METALS, &c.		
b Aluminium Ingots, in ton lots	per ton	..
b " Wire, in ton lots
b " (1 to 14 S.W.G.)
b Sheet, in ton lots
b Babbit's metal ingots
c Brass (rolled metal 2" to 12" basis)	per lb.	1 1/2 to 1 1/2
c " Tubes (solid drawn)	1 1/2 to 1 1/2
c " Wire, basis	1 1/2 to 1 1/2
c Copper Tubes (solid drawn)	1 1/2 to 1 1/2
d " Bars (best selected)	per ton	£119
d " Sheet	£119
d " Rod	£119
d " (Electrolytic) Bars	£120 10
d " " Sheets	£120 10
d " " Rods	£115 10
d " " H.C. Wire	per lb.	1 1/2
f Ebonite Rod	8/-
f " Sheet	2/6
f German Silver Wire	1 10
f Gutta-percha, fine	6 10
f India-rubber, Para fine	9 1/2
f Iron Pig (Cleveland warrants)	per ton	79/-
f " Wire, galv. No. 8, P.O. qual.	£28
f Lead, English Pig	£28 15
f Mercury	per bot.	£18 15
f Mica (in original cases) small	per lb.	6d. to 8/-
f " " " medium	8/6 to 6/-
f " " " large	7/6 to 14/- & up.
f Nickel, sheet, wire, &c.	Nom.
f Phosphor Bronze, plain castings
f " " rolled bars & rods
f " " rolled strip & sheet
f Platinum	per oz.	210/-
f Silver-plated Bronze Wire	per lb.	1 1/2
f Steel, Magnet, in bars	per ton	£85
f Tin, Block (English)	£174 to £175
f Wire, No. 1 to 16	2/5
f White Anti-friction Metals
f Zinc, Sh't (Viellette Montagne bnd.)	Nom.

Electro-Harmonic Society.—Mr. C. B. Clay will preside at the smoking concert which is to be held to-night at the Holborn Restaurant (King's Hall), at 8 p.m. The artists are announced as follows:—Mr. Philip Ritz, tenor; Mr. George Baker, baritone; Mr. W. H. Squire, violoncello; Mr. Alan Stainer, ventriloquist; Mr. Leslie Harris, sketches at the piano; Mr. Harry May Helmsley, cartoonist and imitations of children; Mr. Bernard Flanders, A.R.A.M., solo pianoforte and accompanist.

Cobalt and its Uses.—Extensive deposits of cobalt exist in Canada, but the metal, which resembles nickel, is more expensive than the latter; nevertheless, it possesses advantages for electroplating purposes, and recently it has been found that an alloy with iron, containing cobalt to the amount of one-third, has a very high magnetic permeability, much higher than that of pure iron or transformer steels, while the hysteresis loss is as low as that of commercial steels. The alloy, however, is brittle and costly.

Kent Collieries Closed.—The *Times* states that, owing to scarcity of labour and transport difficulties, the directors of the Kent Collieries have decided to suspend operations until after the war.

METAL MARKET.

MUNITIONS AND LABOUR.

Fluctuations in December.

(COMMUNICATED.)

Electrical Work in British India.—The following information regarding openings for trade in British India is extracted from the review of the trade of India in the past year. The Director of Statistics to the Indian Government recently reported:—"Electrical machinery for use in connection with water-power plant has great capabilities of expansion. The total number of electrical installations in India is already large, and is increasing. All the larger towns and chief ports possess electric light and electric tramways, or are about to use power for these purposes. A gradually increasing market for electrical machinery is anticipated. In recent years the collieries of India have largely adopted electrical equipment, and here German goods have found an opening. The Calcutta market has in late years been flooded with cheap German materials for electric wiring, such as cables, switches, ceiling roses and cut-outs. Since the outbreak of hostilities this source of supply has ceased, and the United Kingdom is likely to capture the German trade in these goods, provided the requirements of the market are carefully studied."—*Board of Trade Journal*.

Australian Electrical Contract Conditions.—A beneficial effect directly attributable to the amalgamation of the New South Wales and Victorian Electrical Engineers' Associations was reported to the Victorian Branch, last week, by Mr. W. J. Newbigin, who represented that Branch at a conference with the Federal Council of the Electrical Association of Australia. As a result of that conference, model contract conditions have been evolved, which, although differing in several respects from those now made by Government and municipal engineers, will almost certainly be adopted by those officials. They have already been approved by representatives of the electrical contractors. The conditions were drawn up a few days ago in Sydney by a committee, including the chief engineer of the Sydney tramways, the city electrical engineers of Sydney and Melbourne, a New South Wales Government assistant electrical engineer, an electrical contractor, and a consulting engineer, all of whom are on the Electrical Association's Federal Council. No such arrangement could have been arrived at, Mr. Newbigin said, but for the amalgamation.—*Australian Mining Standard*.

THE year 1914 will ever be remembered as the year of the outbreak of the great war; the year 1915 will be remembered as the year of muddle by the Government and "squabbles" among the "powers that be," but the capital error that stands out in high relief among all the muddling is the way in which the Government has obeyed the dictates of the Labour leaders. To any business man it is pitiful to see members of the Cabinet appealing to the representatives of Labour not to ask for any further advance in wages, as the country cannot afford it. The manner in which the South Wales miners defied the Government in the early part of the year, the spectacle of munition workers going to prison rather than obey the laws of the country, and the Minister of Munitions begging the workmen to allow women workers to assist the country in its great need, can only be characterised as disgraceful. It is sad to think that men claiming to be citizens of this great Empire, in a time of stress, and when their brothers are fighting for their lives in the trenches to defend the hearths and homes of those left behind, should act in such a mean and selfish spirit, as if the only thing that mattered was to guard what they claim as their legitimate rights and privileges. It is, however, worse to know that this state of things is due mainly to the Government pandering to the demands of the Labour leaders in the past, and thus giving a loose rein, and even encouragement, to the propagation of Socialist fallacies, which teaching can only lead to anarchy. The duty of the Government was and is to guard and defend the liberty of the individual, whether he be workman or master.

The whole question has now become of vital importance—not only at the present time when the country is in danger, but also in the future—for there can be no doubt that, after this terrible war, the strife between capital and labour will become extremely acute, and it behoves every sensible man, whether he be employé or employer, to try and find some solution. It is no use blinking at facts, as business men have been obliged to do for some years past in their desire to make the best of the situation, whilst they saw Germany moving forward by leaps and bounds, wresting the markets of the world from them bit by bit. It is not generally known, but it is a fact nevertheless, that the great British coal trade, the staple of our industries, in so far as the export trade was concerned, would, in the course of time, have been controlled by German coal merchants, and it is well enough known how the German tentacles were reaching out to control the electrical industry.

Returning, however, to the point at issue, the latest move on the part of Labour is the amalgamation of three important trade unions, viz., the Miners' Federation of Great Britain, the Railway Workers' Union, and the Union of Transport Workers. To put it bluntly, its one object is to paralyse industry, and to put pressure on the British public to compel the employers to grant the demands of the members of any one of the unions. And it is highly probable that they expect to gain support from the Government, as they did—and obtained it—in the national coal strike. What is to be the outcome of all this combination for POWER? which, so far as the liberty of the individual is concerned, is equally as bad as, or worse than, German militarism, which we are now sacrificing blood—the best blood in the country—and treasure to break. It is noteworthy that the greatest opponents to conscription in this country have been the Labour leaders, yet as regards their own particular trade unions they put into operation the vilest form of conscription, and it is well enough known that many members of the unions are only members through sheer terrorism. Britain has ever been known as the land of freedom, and, politically speaking,

it still is, but it would appear that we are fast giving up our birthright for what is neither more nor less than trade union slavery.

One has become so accustomed to dealing with trade union officials that the individualism of the employee is wholly lost, and many employers are afraid to give any man work unless he is a member of the union. Other employers of labour have come to the conclusion that all workmen ought to be members of their union, and that all employers ought to belong to an employers' association. It has practically come to this. But one may ask, where is the boasted liberty of the individual? Again, what has been the effect of the power of the unions? Its acknowledged evils are slackness and defiance of all authority, even the authority of the trade union leaders themselves. But it sinks deeper than this. It has become a national curse in its effects upon the youth of the country, and the recent troubles between capital and labour, defiance of all law and order, wilful restriction of output—which even Mr. Lloyd George has at length had to admit—are but the fruits of want of discipline in the past. Bernhardt says in his "Germany and the next War," "The English nation, under the influence of growing wealth, a lower standard of labour efficiency—which, indeed, is the avowed object of English trade unions—and of the security of its military position, has more and more become a nation of gentlemen at ease and of sportsmen, and it may well be asked whether, under these conditions, England will show herself competent for the great duties which she has taken on herself in the future." Again: "We must never forget this. Hard, laborious work has made Germany great; in England, on the contrary, sport has succeeded in maintaining the physical health of the nation; but by becoming exaggerated, and by usurping the place of serious work, it has greatly injured the English nation." Unfortunately every word is true, and we question whether there is a single person—except, perhaps, a Labour leader, whose livelihood depends mainly on slackness and restriction—who would attempt to deny it. Is it any wonder the Prussians thought us "contemptible?" One is almost inclined to say, "Thank God for the war," as it has at least arrested us on the way to destruction.

For years past it has been well enough known to employers that restriction of output, and restriction alone, was ruining every industry in the country; and the wail of every coal owner is not so much against the Minimum Wage and the Eight Hours' Acts, as Acts of Parliament, but the fact that in each case the output decreased after the Acts came into operation. The higher the wages the less the work, the greater the cost of production, and the greater defiance to law and authority by the workmen. Yet the Government would not accept the owners' explanations, or believe the facts which were placed before it, but forced the men's demands upon them. These inevitably reacted on the public purse, and the great British public wondered why! Will this same great British public realise now, that the British workman, and especially the British miner, is neither more nor less than a spoilt child, petted and pampered by a weak Government until he is no longer fit to "fend for himself," and whose constant cry is "we will have more wages," without any thought for others, or the least exercise of intelligence by asking himself the question as to where they are to come from? He either cannot, or will not, realise that wealth is the result of production, and that if he refuses to produce there can be no wealth to distribute. To-day we are spending at the rate of £5,000,000 a day, and it has been estimated that at least £1,000,000 a day might be saved were it not for the evils of restriction in the past, and it is believed that at least 15 to 20 per cent. more coal could be produced per day in the coal mines of Great Britain if each workman would but do his best. The valiant Labour leaders will say this is a vile calumny on the British working man. Rubbish!

It is true; and no one knows better that it is true than the Labour leader, but it is his profession to support methods and ideas which are fast sapping the very manhood from the British nation. That there are some splendid workmen no one would for a moment attempt to deny. This country would not have been in such a good position as she is to-day were it not for that fact, together with the patience and long-suffering of the employers. These men, however, have no great love for the trade union official, and thousands of them have emigrated to the Colonies where they are free to exercise their skill and ambition untrammelled by the rules and regulations of the "delegate," "shop steward," or "local secretary." England a free country—Free! When the Minister of Munitions must ask the "shop steward" if he will kindly allow the owners of the works to employ women; or when half-a-dozen pit lads can stop a concern involving thousands of pounds capital and cause hundreds of workmen to lose a day's pay. And it is the trade union leaders at the head of such freedom as this who aim at becoming the Government of the country, and who can claim the right to have absolute control of "all the means of production and distribution." Better the success of German arms! The iron heel of Prussianism would be lighter in comparison, than to be subject to the abject slavery and decadence of present-day trade unionism.

If, however, we are wise and take to heart seriously the lessons the past has taught us, and every man, whether employer or employee, will form a New Year firm resolution to do the very utmost for his country and incidentally for himself, it may yet prove that the greatest folly Germany ever committed was when she went to war.

TIPS FROM CHINA.

By GEORGE R. ARCHDEACON, A.M.I.E.E.

FOUR months ago I wrote a few hints which I hoped might prove useful in assisting British manufacturers in their attempt to obtain the German trade formerly done with China.

Since writing that article I have so frequently been asked for information about the Chinese workman that I am now attempting to set forth a few of the most common characteristics of what is, perhaps, the most complex type of humanity in existence.

All too frequently the newcomer is apt to take the peculiar Chinese temperament for granted without in any way trying to understand it. It is in this manner that opportunities of progress are so often missed, for a deeper knowledge of the native mind would naturally lead to a clearer understanding and a wider sympathy, which would be of inestimable value in assisting the Britisher in his financial dealings with the Chinese, whom I have often heard described as "the first gentlemen in the Far East."

Let me warn all British engineers and representatives that, although we may not find the Chinese of interest, the Chinese, from the moment of our arrival, will subject us to such scrutiny that before we are aware of it they will have our character so well summed up that they will be able to trick us and play upon our pet foibles and weaknesses in an amazing manner.

They will carefully watch us and plumb the depths of our knowledge until they are convinced whether or not we "savey our pidgin," and if they find us wanting we shall earn to the full their deepest contempt, for the Chinese are thorough. It may be only in one direction, but in that particular direction they soon acquire an almost uncanny aptitude in the application of that one quality.

"First impressions are lasting," therefore we have to find some method of impressing the Chinese. A good way is to get him "tied up" on some piece of work in which we are particularly expert, go to his rescue, for once condescend to take our coat off, and show him how it should be done, most carefully seeing that we do it correctly, after which we must patiently explain the whole process, meanwhile commenting on the simplicity of the operation.

In this manner we shall have benefited him and shall have secured his profound admiration for our skill and knowledge, the advertising of our wonderful capacity will be for ever established, and we shall be listened to with all the credibility of a veritable Solomon.

Chinese foremen are usually referred to as "No. 1." The author has generally found that it pays to learn the man's name, and address him by such, as it implies a greater interest in, and familiarity with, him, which is instantly observed by the other workmen, thereby engendering greater authority for our "No. 1."

Perhaps one of the most extraordinary differences between the British and Chinese foreman is the manner in which each regards his job. The former is apt to consider it a great calamity to lose his berth, whilst the latter would prefer to lose a dozen berths rather than lose his dignity.

If at any time we arrive on a job and find the work in progress being wrongly executed, on no account should we lose our temper with our "No. 1" (if we value his services). We must explain with firmness that we object to that method, and order whatever alterations we consider necessary to be immediately undertaken.

If by any chance we had lost our temper and reprimanded our "No. 1" before the men, he would have "lost face," and would most probably say:—"Master, I no can stay more, better you makee pay me, I go catchee new pidgin." The correct word would have been to screw down the safety valve and wait until we had the "No. 1" in the office, and there let the steam "blow off" to our heart's content.

The author has had experience of workmen in about six different countries, and he is of the opinion that, man for man, the Chinese workman will compare very favourably with the best skilled men in Europe. There is, however, one grave fault with Chinese labour—greater supervision is needed. Frequently the Chinese workman will be engaged for weeks upon repetition work, and will work in strict accordance with his instructions, when, suddenly, without any apparent reason, some curious kink in his mind will cause him to depart from his former method and adopt an entirely new one.

From time to time one hears a great deal about the terrible vice of opium smoking; upon closer acquaintance, however, it is found to be no more terrible than the alleged habit of the British workman of dropping into a convenient "pub" and coming out drunk.

The Chinese are, without doubt, amongst the most frugal and thrifty people in the world, and, with the exception of the various religious festivals, they will never lose time if they can possibly crawl to work. What would not the Minister of Munitions be able to do with such men!

In all intercourse with Chinese in superior stations in life the Britisher should not make the mistake of talking "pidgin English." A Chinese merchant takes it as a compliment if we speak to him in "pukka" English. He may not understand half we say, but he will smile blandly upon us, feeling that we are treating him as an equal, and not as a member of the coolie class.

It may, or may not, come as a complete surprise to many readers when we tell them that China is the home of Trade Unionism. The Chinese have probably forgotten more about the ethics of trade unionism than the whole of the British Labour Party

ever knew! Everyone belongs to a trade union or a guild, as they are called—fitters, turners, tailors, shoemakers, nursemaids, washerwomen, house-boys, coolies, etc.—all have their separate guilds, and woe to the employer whose bad luck it is to be "black-listed." If our name does in time appear on this list, we shall slowly but surely begin to realise that our works are not running so smoothly as formerly, and our best men will leave and be replaced with some difficulty until we have appeased the powers that be.

BRITISH MANUFACTURERS AND FUTURE TRADE IN BELGIUM.

By "BELGIAN."

A GOOD deal has been said and written about the extension of British exports to new fields of commercial activity, but although many schemes have been put forward, none has actually been accepted as a basis for such an extension. Up to the present manufacturers have been left to their own initiative, and that is where the trouble lies. It is not by independent efforts that a trade of any magnitude will be built up abroad; but it is by the co-ordination of ideas accepted by all, and followed by all, that a substantial and durable result will be attained.

An association of manufacturers—there is one for nearly every trade—was needed to keep up the interests of the Home market, and will be needed still more, after the war, to stop any new attempt at German competition. A similar organisation is needed to control the export of goods, and, if it be worked on a sound basis, it is bound to bring success.

But the manufacturers have got to make up their minds *now*, to form a board to consider, and take adequate measures to meet, the Continental requirements in the near future. Inquiries will then be pouring in asking prices for such-and-such materials, complying with the Continental Associations' and Supply Co.s' rules; and what will the answers of British firms contain? Will there not be offers of material made to the British standards and regulations, which is *not* what is required abroad, and will not do?

To point out the importance of my views, I may mention the following cases from my own experience:—

1. British-made china cut-outs (of an old type) were refused on account of their construction, when submitted to the Supply Co.—the type in question was made as nearly as possible to the Continental pattern.

2. A consignment of steel tubing by a well-known British firm, screwed to the Continental thread, had to be sent to a Belgian factory to receive the inside insulation required by all fire insurance companies. In my efforts to introduce the British article, I procured the necessary dies and tools from Germany, and had them sent over here at my own expense; but the cost of production and of insulation proved too much to compete against the German article.

3. The use of tumbler switches on a 220-volt a.c. circuit was objected to by the Supply Co.

4. The different Continental regulations and standards of output, well known here, but seldom applied, by the manufacturers.

The Board of Exports is required now, to prevent friction between dealer and manufacturer as regards the right article wanted, by making inquiries, and acquainting the trade with the results obtained; and to prepare for all emergencies that will arise. Another reason: We were dependent on Germany for a lot of articles that we did not make ourselves and that were too expensive to obtain in another country. We shall be confronted with the same problem after

the war. If the British-made article is found too expensive, the duty of the Association will be to advise the firms concerned to have the articles asked for—they are nearly all patented—made for them in an acknowledged factory in Belgium, so as to save the expenses of transport, customs duties, and also the delay in delivery. Such a policy would increase the profit of the patentee, but it would enable the article to be made at a price suited to the Continental market.

The Association would also communicate the market conditions prevailing at any time, also the financial terms accepted. The sending of money before the dispatch of the goods, as required before the war, will not do.

There are, no doubt, many more reasons for taking steps to form an association at an early date, which have already been made known by other writers in previous articles.

THE DESIGN OF HIGH-PRESSURE DISTRIBUTION SYSTEMS.

By J. R. BEARD, M.Sc., A.M.I.E.E.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS, December, 1915.)

(Continued from Vol. 77, page 863.)

Lay-out of Distribution System.—Except in special circumstances it is usually essential for each sub-station to have at least two separate sources of supply, and, if the supply to the sub-station is not to be interrupted by a failure of one source, some form of discriminating protective device must be installed on each feeder in order to isolate it automatically in the event of its breakdown. It is, however, not so generally recognised that it is of equal importance that a fault on one feeder must not interfere with the supply through the sound feeders however severe the fault may be. The only forms of protection in commercial use which meet these conditions under all circumstances are the balanced-current protective system with pilot wires and the split-conductor protective system. Both have the further advantage that the isolation of the faulty feeder is practically instantaneous and can be effected with quite a

FIG. 7.—NORTH-EAST COAST HIGH-PRESSURE DISTRIBUTION SYSTEM. Generating stations shown cross-hatched.

low value of the fault current, so that the disturbance to the general system is a minimum. They increase the cost per mile of a main of given section, but this is counterbalanced by the saving effected by the possibility of using an interconnected system which allows of:—

- (a) A reduction in the cost of mains due to the saving in spare feeders.
- (b) A reduction in the cost of mains due to the possibility of replacing a number of small feeders by a few large ones which are cheaper per ampere of carrying capacity.
- (c) A reduction in the amount of switchgear required.
- (d) A reduction in the total annual cost of mains, owing to its being possible to take advantage of the diversity between the demands of different sub-stations.

The extent to which a system may be safely interconnected by the use of these devices is shown by fig. 7, which illus-

FIG. 8.—DIAGRAMMATIC LAY-OUTS OF DISTRIBUTION SYSTEMS.

trates diagrammatically the high-pressure distribution system on the North-East Coast. No less than 350 sub-stations are connected to this system, and it is fed by 15 power stations, many of which utilise waste energy in the form of exhaust steam and coke oven gas. The whole of the feeders shown are normally in commission and interconnected, the older ones being equipped with balanced-current protection and the more recent ones with split-conductor protection. As showing the reliability of both these forms of protection, the operating records of this system show that over a period of time, selected quite at random, faults occurred on 23 feeders equipped with automatic protection, and that in 22 cases the faulty feeder was instantaneously isolated without causing an interruption of supply to a single sub-station except in one instance, where the sub-station in question was given a non-duplicate supply through the faulty feeder. In the remaining case, although the protective gear operated satisfactorily, one of the feeder switches failed to open due to a mechanical fault; this was equivalent to a bus-bar fault and brought out the overload gear at two sectioning points, thus limiting the trouble to this section of the system.

In the following investigation an attempt is made to give definite figures for the saving effected by an interconnected system. These figures show that the saving is not only sufficient to balance the cost of the special protective devices, but that a system so equipped is actually cheaper than systems protected by less efficient methods which do not give the same freedom from interruption of supply.

In order that the results may be on the conservative side the extra cost of the special protective devices has been taken at 10 per cent. on the switchgear, including building accommodation, and at 2s. per yard on the mains, which is sufficient to cover the cost of balanced-current protection, and decidedly more than sufficient to cover the cost of split-conductor protection. In the first place, a comparison will be made between the three types of system that are available in the case of the supply to a number of sub-stations, the supply to which must be reasonably free from interruption. These are:—

- (1) An interconnected system equipped with balanced-current or split-conductor protection, which ensures complete continuity of supply to all sub-stations in the event of a fault on a feeder.
- (2) A simple radial system with duplicate feeders direct from the power station to each sub-station, equipped with time-limit overloads at the power-station end and reverse-power relays at the sub-station end. This limits the risk of interruption to the sub-station fed by the faulty feeder, and has been adopted for important supplies such as that to the London underground railways. Owing to the defects of the reverse-power relay, it cannot ensure complete continuity of supply to the sub-station affected.

(3) A series radial system with duplicate feeders to each sub-station protected as in (2), but with direct feeders from the power station to only half the sub-stations, each of these in turn feeding one of the remaining sub-stations. This involves graded overload gear, and a faulty feeder may shut down both the sub-stations in connection with it, and will probably shut down one of them; it is therefore only permissible where continuity of supply is not of such vital importance.

For the purpose of the comparison, a typical case is assumed of an area of 25 square miles with the power station at the centre and a sub-station with a maximum load of 500 kw. at 0.8 power factor and a load factor of 80 per cent. situated at the centre of each square mile, the distribution being effected by underground mains at 6,000 volts. It is assumed that owing to the diversity between the various sub-station loads the power-station load-factor will be 50 per cent., and the average feeder load-factor on an interconnected system, 40 per cent. The average maximum feeder currents are therefore reduced by assuming the sub-station maximum demand to be reduced in the ratio of the sub-station load-factor to the average feeder load-factor. This only holds for the interconnected system, but in the first instance the same reduced sub-station demands will be taken for other types of system, i.e., the advantage which an interconnected system gains from its utilisation of diversity is neglected.

The annual cost per switch panel is taken from fig. 11, and the annual cost of the mains from fig. 6, the proper deductions being made in the case of types (2) and (3) for the omission of the special protective devices. Table I gives the comparison, while the diagrammatic lay-outs of the three types of system are shown in fig. 8 (a), (b), and (c).

TABLE I.

Type of system.	Reference to figs.	No. of switches.	Mileage of mains.	Annual costs. £	Percentage increased cost over interconnected system.
Interconnected ...	8 (a)	64	32.0	4,752	—
Simple radial ...	8 (b)	96	93.7	7,664	61.3
Series radial ...	8 (c)	96	61.2	6,075	27.8

TABLE II.

Interconnected ...	8 (a)	64	32.0	4,752	—
Semi-duplicate "tee" ...	8 (d)	80	48.0	5,478	15.3
Change-over "tee" ...	8 (d)	56	48.0	5,216	9.8

In certain cases where momentary interruption of supply is not of great importance a "tee" system has been used, arranged as shown in fig. 8 (d). Each sub-station is normally given a non-duplicate supply from one of the feeders, and arrangements are made for the sub-station to be changed over to the other feeder in emergency, thus involving a complete temporary interruption in the supply to all the sub-stations fed by the faulty feeder. In a modification of this system both tees into the sub-station are normally closed through switches equipped with time-limit gear, but the sub-station bus-bars are sectioned by a special switch. The sectioning switch may be either left open or it may be closed and equipped with instantaneous overload gear, so that it will immediately trip in case of a feeder fault. In either case supply is automatically maintained to half the sub-station bus-bars, and by opening the faulty feeder switch and closing the sectioning switch complete supply to the sub-station can be resumed.

Table II gives a comparison of these systems with the interconnected system, and it is interesting to note that the latter is still cheaper in spite of the great sacrifices in security entailed by the "tee" systems.

The foregoing comparison proves that the interconnected system is the most economical for the particular case which

has been selected as typical; but in order to make the investigation complete it is necessary to show that this superiority still holds under other conditions, and accordingly the interconnected system will be compared with the cheapest system giving reasonable security of supply—the series radial system—under various modified conditions which may obtain in practice. These are:—

(1) The same number of sub-stations distributed one mile apart in a ring round the power station, or in line one mile apart with the power station at the centre, as shown in fig. 8 (e), (f), (g), and (h).

(2) The area of supply extended or decreased with the same number of sub-stations and the same total load on the system, i.e., the sub-stations situated at the increased and decreased spacings of one per 4 square miles and four per square mile respectively, instead of one per square mile, the load per sub-station remaining the same.

(3) The area of supply extended to, say, 49 square miles with the same density of load and a correspondingly increased number of sub-stations supplied from the central power station, as shown in fig. 8 (i) and (j).

(4) The original distribution of sub-stations but with increased or reduced loads per sub-station, the alternative loads considered being 250, 1,000, and 2,000 kw. The arrangement of feeders remains the same for the series radial system, as a cable capable of dealing with the load of two 2,000 kw. sub-stations in emergency is not too large to be handled. For the interconnected system it is necessary to run more feeders from the power station to deal with the heavier loads, the feeder arrangements which would be adopted for the 1,000 and 2,000-kw. sub-stations being shown in fig. 8 (k) and (l) respectively.

The details of the comparison are given in Table III.

The outstanding features of this comparison are:—

(a) The economy of the interconnected system is generally maintained.

(b) The saving effected by an interconnected system rapidly increases as the area of supply is enlarged. This is important, as only relatively restricted areas have been considered.

(c) The saving is greatest for lightly loaded sub-stations and decreases as the sub-station loading increases. In the case of the most heavily loaded sub-station it would appear at a first glance that while the interconnected system may have other advantages, its direct economy is very small. This is only apparent, for in the first case the saving due to diversity has been ignored, and secondly it will be found on investigation that a point has been reached at which distribution at so low a voltage as 6,000 is uneconomical. With a sub-station loading as high as 2,000 kw. the distribution system costs 37.1 per cent. more at 6,000 volts than it would at 11,000 volts, while if a pressure of 11,000 volts were adopted the interconnected system would show a saving of 21.8 per cent. compared with a series radial system at the same voltage.

The possible further savings which may be effected if diversity is taken into account have been considered, and without going into details of the calculation it may be taken as adding something of the order of 43 per cent. to the cost of a simple radial system, and rather less to the cost of a series radial system.

When comparing an interconnected system with other types, two further points must also be borne in mind.

(1) It is a very difficult matter exactly to forecast sub-station maximum loads or, as in the case of railways, definitely to fix the allocation between the various sub-stations. If the sub-stations are fed independently it is obvious that in proportioning the feeders to them allowance must be made for the assumed maximum loads being exceeded or varied, while if the sub-stations are interconnected, the particular distribution between the sub-stations does not greatly matter so long as the total system load is unaltered.

(2) The greater part of the saving effected by an interconnected system is in the trunk feeders, and in consequence it is more marked the farther the power stations are removed from the centres of load. In the above comparisons the power station has been taken at the electrical centre of gravity of

TABLE III.

Nature of modification to the typical system.	Type of system.	Reference to fig. 8.	No. of switches.	Mileage of mains.	Annual cost. £	Percentage increased cost over corresponding interconnected system.
Sub-stations distributed in ring	Interconnected series radial	(e)	64	54.6	8,179	—
Sub-stations distributed in line	Interconnected series radial	(f)	96	115.9	10,977	34.2
Sub-stations spaced one per 4 square miles	Interconnected series radial	(g)	66	84	11,508	—
Sub-stations spaced four per square mile	Interconnected series radial	(h)	96	168	15,644	35.9
Area of supply increased to 49 square miles	Interconnected series radial	(a)	64	64.4	8,736	—
Area of supply increased to 81 square miles	Interconnected series radial	(c)	96	122.4	11,103	27.1
Sub-station load reduced to 250 kw.	Interconnected series radial	(a)	64	16.0	2,760	—
Sub-station load increased to 1,000 kw.	Interconnected series radial	(c)	96	30.6	3,562	29.0
Sub-station load increased to 2,000 kw.	Interconnected series radial	(i)	128	69.0	11,108	—
	Interconnected series radial	(j)	192	166.9	16,135	45.2
	Interconnected series radial	—	192	120.8	20,621	—
	Interconnected series radial	—	320	347.7	33,124	61.4
	Interconnected series radial	(a)	64	32.0	3,960	—
	Interconnected series radial	(e)	96	61.2	5,295	33.7
	Interconnected series radial	(k)	64	35.3	6,533	—
	Interconnected series radial	(c)	96	61.2	7,721	18.2
	Interconnected series radial	(l)	80	53.2	10,469	—
	Interconnected series radial	(c)	96	61.2	10,572	1.0

the load and, therefore, at the least favourable position for the interconnected system.

So far the investigation has been limited to the comparatively low voltage of 6,000; but, speaking generally, the higher the system voltage the greater is the economy to be obtained by interconnection. This is obvious if it is remembered that—

(a) The higher the voltage the less is the proportionate cost of the protective devices, which is practically independent of the voltage.

(b) The higher the voltage the smaller is the section of the mains for given loads, and consequently the greater the advantage offered by interconnection in reducing the total length of mains and increasing their average capacity.

TABLE IV.

Distribution voltage.	Interconnected system.		Series-radial system.		Percentage increased cost of series-radial system over corresponding interconnected system.
	Reference to fig. 8.	Annual cost—£.	Reference to fig. 8.	Annual cost—£.	
6,000	(f)	10,469	(c)	10,572	1.0
11,000	(k)	7,634	(c)	9,295	21.8
20,000	(a)	7,984	(c)	10,766	34.8

This is shown very clearly by Table IV, which gives the comparison at various distribution voltages between the annual costs of interconnected and series radial systems for the typical distribution of sub-stations and a load of 2,000 kw. per sub-station.

(To be continued.)

A TRAGEDY IN LIMITATION.

By "WHISTLEFIELD."

Extracts from the Price of Coal (Limitation) Act, 1915.

"An Act to provide for the limitation of the PRICE of Coal."

"WHERE coal is conveyed from any pit's mouth over any railway in trucks not belonging to a railway company, the seller of such coal shall not be entitled to charge for the use of the trucks any sum exceeding by more than 50 per cent. the sum which the railway company conveying the coal was actually charging for the provision of trucks at the commencement of this Act."

"If in consequence of this provision the price to be paid by any consumer to whom coal is delivered is reduced by any amount, the price to be paid by any person to whom the coal is delivered in pursuance of any subsidiary contract shall be reduced by an EQUIVALENT amount."

This Act shall not apply to any sale of coal for export . . . or to any sale of coal to be used on any ship.

ACT I. SCENE.—Engineer's office in electric light undertaking in London area.

ENGINEER (dictating): Write to Gilchrist, the coal merchant. Dear Sir,—Confirming my telephone conversation with you to-day, I have notified the colliery people that I intend to take advantage of the clause in the Price of Coal (Limitation) Act, whereby the coal contracts of electric light undertakings made between April 1st, 1915, and July 29th, 1915, are included in the scope of the said Act.

Write to the Colliery. Dear Sirs,—In terms of the Price of Coal (Limitation) Act, 1915, I beg to notify you that I intend to claim the benefit of the Act for the Dambad D.S. nuts contract made through Messrs. Gilchrist & Co. last June. I shall be glad to learn the amended price of this coal at the pit under the terms of the Act, and the amount of reduction which you will make to Messrs. Gilchrist on the present prices when the regulations come into force at the beginning of November.

ACT II. SCENE.—Engineer's Office, November 1st, 1915. Enter Gilchrist, the coal merchant.

ENGINEER, picking up a letter. I say Gilchrist, what's the nonsense about you not being able to make any reduction on the price of our coal? I notified you and the colliery people that we were going to claim it, and the three months allowed by the Act has expired, so I don't see how you can avoid making the reduction; besides, the colliery people have written to say that they are reducing the price to you by 1s. 6d. per ton. You don't think I got them to make a rebate for your benefit, do you? Why, the Act says you are to allow us an equivalent amount.

COAL MERCHANT: That's all very well; I don't deny that the colliery is giving me a rebate, but you can see from the details I gave in my letter that if I gave you 1s. 6d. per ton I'd lose money. My profit now is only 1s. 2d. per ton.

ENGINEER: The figures you give have got nothing to do with it; you contracted last June to supply me at 26s. per ton, and I don't suppose you do that at a loss. Well, then, because

you are supplying it to an electric light undertaking, and I've claimed it, the colliery are compelled to reduce their price from this month by 1s. 6d. per ton, although the contract was made before the Act was passed. Freight's haven't altered since you made the contract, so we are entitled to the 1s. 6d., and your profit per ton is exactly what it was before.

COAL MERCHANT: What about wagon hire?

ENGINEER: They are your own wagons; you are not charging yourself any more for their use, are you?

COAL MERCHANT: I'm entitled under the Act to charge 50 per cent. more on private wagons than the railway company charge for the hire of wagons. Their hire rate is 1s. 10d., and I'm entitled to add 11d. to that.

ENGINEER: But that doesn't apply in this case. If I'm fool enough to fix up another contract with you, you are allowed by the Act, in reckoning the maximum price that you propose to make, to add 50 per cent. on to the railway hire rate for the use of your own wagons, but in the case of an existing contract wagon hires don't come in at all.

COAL MERCHANT: The Act doesn't say so.

ENGINEER: No, of course not; but the Act was framed to limit the price to the consumer. That's why the colliery has to reduce the price, but it didn't intend you to pocket the reduction. Why, man, on your own showing, even if you had to hire railway trucks you would have been making a profit of 7d. per ton, and you propose to take another 1s. 6d.; 2s. 1d. per ton for merely passing on my order and invoicing up the goods.

COAL MERCHANT: That's less than the profit I'm allowed to make.

ENGINEER: How do you make that out? There's nothing about it in the Act.

COAL MERCHANT: I was with a deputation of coal merchants who waited on Mr. Runciman, and he told us that 10 per cent. was a very reasonable profit for the coal merchant. I admit that 2 to 3 per cent. is our usual profit, and I've booked contracts with large users, like yourselves, at 1d. a ton profit; but if Mr. Runciman thinks half-a-crown a ton most reasonable, it's not our place to argue the point, is it?

ENGINEER: But whoever suggested 10 per cent. to him? Did he inquire what the usual profit was?

COAL MERCHANT: No; when we asked him what he considered a fair profit for our work, he hesitated; and when our spokesman asked if he would consider 10 per cent. too much, he said he thought it very reasonable.

ENGINEER: Well, anyway, I'm going to have that 1s. 6d. per ton; it's allowed for by the Act, and if you won't deduct it I shall have to hand the matter over to the Town Clerk to settle.

COAL MERCHANT: The Act may have meant you to get that 1s. 6d., but it hasn't put it clearly, and I think you will find that the Town Clerk will agree with me that it won't stand in Court of Law, especially as the Act says that the decision of the Board of Trade will be final on any points not otherwise allowed for, and Mr. Runciman allows us 10 per cent. profit. I'd advise you to go and see him about it; he's a very nice gentleman to deal with—at least, we found him so.

ACT III. SCENE.—Engineer's office, a month later. Enter Gilchrist, the coal merchant.

ENGINEER: I say, Gilchrist, what's gone wrong with your coal deliveries the last three weeks? You are only putting in half your quantities; I've not more than four days' supplies in my bunkers, and if you don't send more along in a hurry I'll have to draw from my reserve stock. It cost 6d. a ton to put it into that store, and it will take 4d. a ton to wheel it into the bunkers; 10d. a ton added on to the price of the coal through your bad deliveries.

COAL MERCHANT: Don't blame me, sir; it's your precious Act that's responsible.

ENGINEER: How do you make that out?

COAL MERCHANT: Why, London is always a cut market for coal; the collieries can always get about 1s. a ton more for coal sent to the Midlands, and it's going there.

ENGINEER: But the Act doesn't allow them to charge two prices?

COAL MERCHANT: The Act allows them to add 4s. on to the prices they used to get, so the coal goes to the Midlands, and it's only when they have coal to spare that it comes to London. Just now the Midlands can take all that they can spare from the shipping trade. I've never known such a shortage of coal on the London market as there is just now, and it's going to be worse. The Act allows them to charge anything they like for export coal, and there is a big demand abroad; if they could get enough boats there'd be no coal to be bought in this country; it's the shortage of boats that enables you to get coal at all. A man phoned me yesterday and offered to pay one shilling or two shillings a ton above his contract price if the colliery would send him his full quantities, but they aren't take it; it's against the Act to charge more than they are doing. He'd have had to do without, like other people, if I hadn't arranged to buy a quantity from a coal merchant who is a friend of mine in the Midlands; that means he pays two coal merchants' profits, and the extra shilling the colliery charges for coal to the Midlands, and nearly double the railway freight. That is how your Act works for those who must have coal. It hasn't limited prices at all except in a very few cases, and some of the poorer grades of coal are actually up in price. We would all have been far better off without the Act. Here am I allowed to charge 10 per cent. profit and can't get coal to sell.

ENGINEER: Well, that doesn't help me; what am I to do when my reserve stock is used up?

COAL MERCHANT: You'd better ask Mr. Runciman.

(Exit the coal merchant and the engineer, the latter to take on a squad of labourers to wheel in coal from his store.)

TRADE STATISTICS OF CANADA.

THE following figures, showing the imports into and exports from Canada of electrical and similar materials during the year ended March 31st, 1915, are taken from the recently-issued trade statistics. Figures for the year 1913-14 are given for purposes of comparison, and notes of any increases or decreases have been added:—

IMPORTS.

	1913-14. Dols.	1914-15. Dols.	Inc. or dec. Dols.
<i>Railway passenger cars.—</i>			
From United States ...	2,067,000	257,000	- 1,810,000
<i>Motor cars for railways and tramways.—</i>			
From United States ...	72,000	50,000	- 21,000
<i>Copper wire, plain, tinned, or plated.—</i>			
From United Kingdom ...	1,000	2,000	+ 1,000
" United States ...	115,000	23,000	- 92,000

Electric light carbons and carbon points.—

From United Kingdom ...	5,000	1,000	- 4,000
" United States ...	39,000	36,000	- 3,000
" Germany ...	40,000	6,000	- 34,000
" Other countries ...	5,000	1,000	- 4,000
Total ...	89,000	44,000	- 45,000

Incandescent lamp bulbs, etc.—

From United Kingdom ...	—	1,000	+ 1,000
" Austria ...	14,000	8,000	- 6,000
" Germany ...	—	4,000	+ 4,000
" United States ...	110,000	54,000	- 56,000
" Other countries ...	8,000	3,000	- 5,000
Total ...	132,000	70,000	- 62,000

Electric apparatus not mentioned (insulators, batteries, telegraph and telephone instruments).—

From United Kingdom ...	809,000	538,000	- 271,000
" Austria ...	2,000	2,000	—
" France ...	29,000	9,000	- 20,000
" Germany ...	141,000	68,000	- 73,000
" Sweden ...	80,000	41,000	- 39,000
" Switzerland ...	3,000	2,000	- 1,000
" Italy ...	5,000	8,000	+ 3,000
" United States ...	5,515,000	3,675,000	- 1,840,000
" Other countries ...	13,000	1,000	- 12,000
Total ...	6,597,000	4,344,000	- 2,253,000

Manufactures of india-rubber and gutta-percha (except tires, clothing, and similar goods).—

From United Kingdom ...	231,000	224,000	- 7,000
" Austria ...	15,000	3,000	- 12,000
" France ...	9,000	3,000	- 6,000
" Germany ...	61,000	24,000	- 37,000
" United States ...	776,000	621,000	- 155,000
" Other countries ...	5,000	2,000	- 3,000
Total ...	1,097,000	877,000	- 220,000

Gasoline engines.—

From United Kingdom ...	111,000	85,000	- 26,000
" United States ...	2,457,000	1,905,000	- 552,000
" Other countries ...	2,000	44,000	+ 42,000
Total ...	2,570,000	2,034,000	- 536,000

Steam engines.—

From United Kingdom ...	50,000	67,000	+ 17,000
" United States ...	386,000	170,000	- 216,000
" Italy ...	19,000	—	- 19,000
Total ...	455,000	237,000	- 218,000

Steam boilers.—

From United Kingdom ...	112,000	35,000	- 77,000
" United States ...	273,000	163,000	- 110,000
Total ...	385,000	198,000	- 187,000

Concrete mixing, cement making, and coal handling machines.—

From United Kingdom ...	32,000	7,000	- 25,000
" United States ...	459,000	241,000	- 218,000
" Other countries ...	4,000	1,000	- 3,000
Total ...	495,000	249,000	- 246,000

	1913-14. Dols.	1914-15. Dols.	Inc. or dec. Dols.
<i>Asbestos manufactures.—</i>			
From United Kingdom ...	50,000	33,000	- 17,000
" United States ...	415,000	188,000	- 227,000
" Other countries ...	9,000	6,000	- 3,000
Total ...	474,000	227,000	- 247,000

Electric motors, generators, and dynamos.—

From United Kingdom ...	136,000	175,000	+ 39,000
" France ...	4,000	2,000	- 2,000
" Sweden ...	103,000	25,000	- 78,000
" United States ...	1,542,000	1,146,000	- 396,000
" Germany ...	14,000	—	- 14,000
" Other countries ...	8,000	1,000	- 7,000
Total ...	1,807,000	1,349,000	- 458,000

All machinery not mentioned, except sewing machines, textile machinery, printing machinery, etc.—

From United Kingdom ...	1,702,000	992,000	- 710,000
" France ...	79,000	5,000	- 74,000
" Germany ...	163,000	110,000	- 53,000
" United States ...	12,811,000	8,091,000	- 4,720,000
" Other countries ...	67,000	66,000	- 1,000
Total ...	14,822,000	9,264,000	- 5,558,000

Iron and steel wire, single or several, covered with cotton, linen, silk, rubber, or other material, including cables so covered.—

From United Kingdom ...	304,000	159,000	- 145,000
" United States ...	563,000	175,000	- 388,000
" Other countries ...	11,000	4,000	- 7,000
Total ...	878,000	338,000	- 540,000

Lighting fixtures of metal (including electric).—

From United Kingdom ...	31,000	11,000	- 20,000
" Austria ...	8,000	1,000	- 7,000
" United States ...	637,000	401,000	- 236,000
" Other countries ...	29,000	5,000*	- 24,000
Total ...	705,000	428,000	- 277,000

* Germany, 6,000.

Plumbago, ground and manufactured.—

From United Kingdom ...	14,000	4,000	- 10,000
" United States ...	47,000	34,000	- 13,000
Total ...	61,000	38,000	- 23,000

EXPORTS.

	1913-14. Dols.	1914-15. Dols.	Inc. or dec. Dols.
<i>Mica.—</i>			
To United Kingdom ...	36,000	32,000	- 4,000
" United States ...	156,000	184,000	+ 28,000
" Other countries ...	17,000	2,000	- 15,000
Total ...	209,000	218,000	+ 9,000

Electrical apparatus.—

To United Kingdom ...	25,000	17,000	- 8,000
" Newfoundland ...	9,000	16,000	+ 7,000
" United States ...	67,000	49,000	- 18,000
" Other countries ...	6,000	16,000*	+ 10,000
Total ...	107,000	98,000	- 9,000

* Newfoundland, 16,000.

Machinery (other than washing and sewing machines and typewriters).—

To United Kingdom ...	84,000	40,000	- 44,000
" Newfoundland ...	56,000	20,000	- 36,000
" New Zealand ...	9,000	5,000	- 4,000
" Argentina ...	9,000	21,000	+ 12,000
" France ...	23,000	9,000	- 14,000
" United States ...	729,000	188,000	- 541,000
" Other countries ...	76,000	31,000*	- 45,000

Total ... 986,000 314,000 - 672,000

* Australia \$9,000, and Russia \$11,000.

Gasoline engines.—

To United Kingdom ...	—	7,000	—
" Newfoundland ...	76,000*	94,000	—
" United States ...	81,000*	13,000	—
" Other countries ...	—	3,000	—
Total ...	88,000+	117,000	+ 29,000

* Total exports. † Canadian manufactures only.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

AMENDMENTS.

NEW ZEALAND.—The text of the New Zealand "Finance Act, 1915," which was assented to in October last, confirms the amended rates of duty leviable on certain articles on importation into New Zealand which were proposed in the Resolutions introduced into the House of Representatives—vide p. 608 of the ELECTRICAL REVIEW of November 5th. Provision is also made in the Act that every Resolution passed on or after August 20th, 1915—the date from which the new duties take effect—and before the passing of this Act, purporting to impose any duties of Customs, or to create any exemptions from such duties, shall be deemed to have had the force of law, according to the tenor of such Resolution.

SWEDEN.—The exportation of copper (unmanufactured or raw) refined from raw material (not from scrap) at a Swedish refinery has been prohibited as from November 6th by a Royal Decree. The exportation has also been prohibited as from December 10th of carbon electrodes and carbon sulphide; ferro-tungsten (ferro-wolfram) and ferro-vanadium; wolfram and vanadium.

FINLAND.—In virtue of recent decisions by the Finnish Customs, the undermentioned articles are to pay duty on importation into Finland as follows:—Electrodes weighing each 3 kilograms, or more are dutiable under Tariff No. 155 (1) at the rate of 1 mark (Finnish) 20 penni (say 1s.) per 100 kilograms. (220.46 lb.), while electrodes weighing each less than 3 kilograms, are dutiable under Tariff No. 231 (2) at the rate of 12 marks (say 9s. 7d.) per 100 kilograms. Fastening arrangements for electro-technical machines (not being an integral part of such machines) are dutiable under Tariff No. 231 (1) b (1) at the rate of 14 marks 70 penni (say 11s. 9d.) per 100 kilograms.

Generators and transformers (which are to be dutiable separately) are dutiable under Tariff No. 231 (1) c at the rate of 47 marks 10 penni (say £1 17s. 8d.) per 100 kilograms.

JAPAN.—According to a decision issued by the Yokohama Custom House, electric condensers are to be dutiable on importation into Japan under Tariff No. 547 (3) at the rate of 25 per cent. *ad valorem*, the decision to come into force on February 5th, 1916.

BRAZIL.—H.M. Minister at Rio de Janeiro has telegraphed to the Foreign Office that a Commission is to be appointed to study the question of the revision of the existing Brazilian Customs Tariff. The result of the Commission's labours is to be embodied in a Bill which is expected to be laid before the Brazilian Legislature for discussion at the next session.

RUSSIAN FAR EAST.—The official *Bulletin of Laws*, of Petrograd, has published a Decree, which received the Imperial assent on October 10th/23rd, imposing Customs duties on certain goods imported into the Russian Far East. In virtue of this decree a number of articles which were formerly exempt from Customs duties on importation into the Governor-Generalship of the Pri-Amour and into the Transbaikalian Territory of the Governor-Generalship of Irkutsk are in future to be subject to duty, when imported into these regions, at the rates fixed by the Russian Customs Tariff. Among these articles may be noted the following:—

	Rate of duty. Rou. Co- bles. pecks.
Carbons for electrotechnical purposes, weighing—	
(a) less than 10 founs each	per pound 8 80
(b) 10 founs or more each	per pound 1 10
Electrical cables of all kinds	per pound 7 37

Machines and apparatus, etc., as follows:—

All kinds of machines made of copper or its alloys, or in the composition of which copper or any alloy of copper is present in a proportion exceeding 25 per cent. of the total weight of the machine	per pound 9 90
Dynamo-electrical machines and electro-motors of all kinds; electrical transformers	per pound 9 35
Parts of machines not specially mentioned (whether imported separately or together with the machine) composed of copper or copper alloys,	per pound 9 90

Parts of dynamo-electrical machines and transformers are admitted under the immediately preceding classification, except the parts enumerated below:—

Induction coils	per pound 19 47
Armatures and commutators	per pound 14 02½
Frames with parts (other than brasses) of copper	per pound 9 35

Pound = 36 lb.; 100 copecks = 1 rouble = 23. 1½d. at par.

NEW PATENTS APPLIED FOR, 1915.

1915.

- 1,483. INTEGRATING ELECTRIC WATTMETERS. J. Hikeley. January 29th.
- 3,860. ELECTRIC FIRE ALARM CONTACT MAKERS. R. G. Hislop. March 11th.
- 4,654. ELECTRIC TURNING GEAR FOR STARTING INTERNAL-COMBUSTION ENGINES. F. H. ROYCE & ROYCE ROVER, LTD. March 15th.
- 4,685. PROTECTION OF ELECTRIC CABLES. J. H. Bowden & H. F. J. Thompson. March 24th.
- 8,895. ARRANGEMENTS FOR PROTECTING TELEPHONE, TELEGRAPH, AND THE LIKE INSTRUMENTS AGAINST LIGHTNING OR EXCESSIVE ELECTRIC POTENTIALS. A. E. Beattie. June 16th.
- 11,585. PRODUCTION OF UNDAINED OR SUSTAINED ELECTRICAL OSCILLATIONS. F. K. Veeland. August 10th.

"Z" Lamp Festivities.—On December 22nd, at Lawrence Hall, Southfields, S.W., the works entertainment of the "Z" ELECTRIC LAMP MANUFACTURING CO., LTD., was held. It took the form of a tea and concert, at which 200 were present. Among the items in the programme were sleight-of-hand feats by Mr. J. H. Palmer, the works foreman.

Electrical Prosperity Week.—From the accounts which have reached us it appears that the celebration of the Electrical Prosperity Week throughout the United States resulted in a huge success, and public interest was aroused to an unprecedented extent. In Philadelphia, according to the *Electrical World*, prizes for electrical decorations were given to the amount of £100 per night, and 1,160 wiring contracts were signed on special terms: an electric show at Memphis was crowded (admission free), and in Syracuse the electric lighting company was highly pleased with the results obtained; in Milwaukee, during the first two days of a co-operative exhibit, orders for more than \$10,000 worth of goods were received, and similar exhibitions took place in many other centres, always with prodigious success.

NOTICE.

IN view of the recent Increase in the Postal Charges, our Subscription Rates for Great Britain and Canada will further notice be increased to £1 1s. 8d. and £1 3s. 10d. respectively.

At the last annual general meeting of the Institution it was suggested that greater publicity should be given to the doings of the Council and Committees. At present their proceedings are sedulously concealed until in May they are set forth in brief paragraphs in the Council's annual report. Why this practice should obtain, and whether it has any sound reasons to support it, other than the feeble excuse of long-established custom, we do not know; but we remember that the suggestion to change it was heartily welcomed, not only by the members, but also, we believe, by the then President, Sir John Snell.

In support of the proposal we may point out that the secrecy shrouding the proceedings of the Committees conceals from the members in general the activities of the members of the Committees, and thus inflicts an injustice upon the latter; it is also detrimental to the interests of the Institution, as it tends to the diffusion of distorted statements and unfounded rumours as to what is being done, and prevents the vast majority of the members from adequately appreciating the enormous amount of work that their Council and Committees in fact accomplish. Surely there is no necessity for so much mystery. At the risk of incurring the displeasure of the more dignified members—those, for example, to whom the very thought of shopkeeping is distasteful—we may cite the example of the younger body—the American I.E.E.—which prints in its *Proceedings* a report of the monthly meetings of the Board of Directors, together with personal notes, lists of the members of the various Standing and Special Committees (which number no fewer than 36), and a variety of other useful information available only to the directorate. The Institute has 32 Local Sections and 53 "Branches," and is a very live organisation indeed. The American Society of Civil Engineers practises similar methods, and so does the American Society of Mechanical Engineers; both have a membership over 6,600, and the latter has doubled its numbers during the past five years, thanks (in its own words) "to the policy of promoting the welfare of the individual engineer through the development of high ideals in the profession, and its activities in all matters of public interest—and this *without overlooking the human element.*" The words which we have italicised seem to us to touch the root of the complaints which are periodically preferred against our own Institution.

To take another point, the Institution of Civil Engineers has adopted the practice of opening its meetings at 5.30 p.m.; the meetings are preceded, instead of followed, by a social cup of tea or coffee, and we understand that the new arrangement is very popular with the members. We believe that a similar reform would be heartily welcomed by the members who attend the London meetings of the Institution of Electrical Engineers. It has been argued that the members of Council would then be put to inconvenience in respect of their dining arrangements, but even if so unworthy a suggestion were "taken seriously," we cannot imagine that the Council would permit its decision to be swayed by its digestive faculties rather than by the advantage of the members as a whole. People do not wish to be out late nowadays, and the closing of the meeting at 7.30 p.m. would meet their wishes. It is for the members themselves, of course, to press the matter if they approve of the proposal;

experience teaches that the Council will never move unless it is pushed.

A point on which, as a technical journal, we should like enlightenment from the Council concerns the relationship between the Institution and the International Electro-technical Commission. The connection, apparently, is very intimate, yet the Institution, though it has published the list of symbols and abbreviations for electrical quantities which have received the sanction of all the leading nations, has not officially adopted them in its *Journal*. So far as we are aware, the only nations which consistently use the authorised notation are our Teutonic enemies, who are so inured to discipline that with them an official regulation must necessarily be complied with. But does not the Institution intend to uphold the international system? We confess that while the symbols for quantities are acceptable, we do not like some of the signs for the names of units to be employed after numerical values; for example, mA and kW for milliamperes and kilowatt respectively, and kWh for kilowatt-hour—a confusion of types which, to our mind, is unsightly, as well as meaningless. There is no definite sign for the ohm, though either Ω or ω is recommended— ω being used for $2\pi/T$; doubtless the context will generally show that Ω does not now mean megohm (which would be either MO or $M\Omega$), but who would guess that $\mu\Omega$ stood for microhm? However, in spite of our objections, we will use these signs in the *ELECTRICAL REVIEW* if they are given an official standing by our leading authorities.

Another matter, which may prove of more importance than any of those that we have mentioned above, is the question: What are we to do with our aliens? That there is a strong undercurrent of feeling on this matter in the membership of the Institution cannot be denied, and it is not confined to the junior ranks of the profession, very strong views indeed having been expressed by some engineers of high standing. A society consisting largely of members of the Institution addressed a request to the Council to deal with the matter, but, as we recently noted, the Council returned an evasive reply. That the Council possesses adequate powers under the existing Articles to deal with the matter will be obvious from the extract which we reprinted, but we do not anticipate that it will take action unless compelled to do so.

Our own position in the matter can readily be defined. So far as concerns the British-born descendants of alien enemies, and those of alien enemy origin who were residents of long standing and had taken out letters of naturalisation before the war, we feel that they are entitled to immunity from interference of any description; the nation has accepted them as British subjects, and is bound in honour not only to respect but also to uphold their rights and privileges. But as regards actual alien enemies, the position is very different; for them, in view of the barbarities and ferocity, the treachery and dishonourable acts, of their compatriots, we feel no sympathy whatever. A certain number of such enemies are members of the Institution of Electrical Engineers: are we worse off, or are they better off, for that fact? We do not know that it matters one iota, for the moment, whether they retain the title or not; for that matter, they call themselves men, as we do, and we cannot make them divest themselves of the title. The real question, to our mind, is: would the expulsion of our enemies from membership of the Institution serve any useful purpose, now or in the future?

That it could have no possible influence on the conduct of the war is obvious; on the other hand, an alien enemy who could pose as a member after the war might find the title of advantage in promoting trade relations with neutrals, or even with our Allies, by sailing under false colours. The most important and immediate effect of such an expurgation of the roll, however, would be an indirect one. At present members of British nationality, but of alien enemy origin, are necessarily grouped, in the eyes of the public, in the same class as the actual enemy members, and the removal of the latter would help to lighten the shadow which undoubtedly has rested upon the former. Many of our readers feel very strongly on this matter; we urge them to consider it from all points of view and in a judicial frame of mind before taking action, lest injustice be done.

Where there is no Room for Retrenchment.

We read in the newspaper Press that the Retrenchment Committee, to which has been relegated the duty of investigating the expenditure of Government Departments, had under consideration, at its last meeting, the accounts of the Board of Trade. Now we are quite prepared to believe that there are some sections of this all-important department whose staffs require shaking up in a wide-meshed sieve, and that a de-fossilising process might, by means of pensions, bring about a very wise retrenchment. We are not blind to the fact that, as a whole, the Board is an extremely complicated organisation, which over a long period of years has been adding compartment to compartment, until it has become one vast concern, though with its premises scattered here, there, and somewhere else; but, on the whole, we should say that at the present important juncture the Board of Trade is one of the last Government departments in which a reduction in expenditure can be looked for. It may be that there is certain waste taking place there as in too many other places, but it will be dangerous for a Retrenchment Committee to lop off anything here just now unless it has powers also to add something more efficient in its place. And such a privilege as that hardly seems to fall legitimately within the scope of a Retrenchment Committee. We believe it to be the conviction of the business community of the kingdom that the need of the moment is for a large increase in expenditure upon the department which is supposed to assist us in connection with our national industries and trades. The one branch of Mr. Runciman's widespread department which has really at heart the interests of these industries is the Commercial Intelligence Branch, which has been for years poked away in Basinghall Street in miserably dull premises, as though neither it nor its staff were to be permitted to see the exhilarating light of day. It is true that since the outbreak of war other and distinctly more creditable premises have been taken for particular purposes in Cheapside, but the situation of its Basinghall Street offices—cribbed, cabined, and confined as they are—seems to us to be typical of the cribbed, cabined, and confined policy under which the Branch has to operate. Nationally we have been altogether too niggardly in our national expenditure upon trade-cultivation activities. For years we have urged the necessity for spending if need be an additional half a million sterling per annum upon bringing to a state of business efficiency our staff of Consular representatives, commercial attachés, and trade commissioners. We hope that Mr. Runciman will recognise that the good work done by the very small and inadequate number of Trade Commissioners that we have representing British interests abroad has shown that it would be a profitable national investment to appoint at least half-a-dozen or a dozen others. Their services have been appreciated by business firms, who are asking for more. Is it a fact that we have no actual trade representative watching over our affairs in Russia even now?—a market that calls for two or three. Is it not true that for so vast an expanse as Canada we have but one Trade Commissioner? What can reasonably be expected when we do things on such a scale? Of what permanent avail can it be to send a roving commissioner once to visit South America, or, say, China—he may issue an excellent report and answer many questions when he gets home, but these temporary or flash-in-the-pan appointments do not meet the needs of the case, and they certainly will not do so in the future. Hence we see little chance of retrenchment in connection with the Board of Trade Commercial Intelligence expenditure. Indeed, every important consideration just now calls for an increase, for not only must the Branch be enabled to continue and extend the excellent work undertaken consequent upon the war, but the Board's trade activities should be organised at home in such a way that it can intelligently deal with the requirements of different industries, and there ought to be a greatly increased staff of Trade Commissioners. Notwithstanding all the financial burdens that we have to carry at present, we believe that a substantial vote of money would be passed with practical unanimity at Westminster.

We greatly hope that such matters will not be deferred

until after the war. Mr. Runciman has told us of some things that his Department has been doing alone, and in co-operation with outside experts. He says that we shall not be found unprepared for the trade war when it comes, and if we feel that he is a little optimistic in describing Germany as already commercially beaten, it may be because he is in possession of facts concerning which we know nothing, or because he has some far-reaching scheme drawn up which will embrace the above, and some other very interesting measures, for the protection or assistance of our industries. We hope that time will prove such to be the case.

A Tentonic Miscalculation.

In all Allied countries measures are being discussed with great zest with the object of rendering the peoples of those countries independent of the Central Empires, if they still exist as such, after the war. Movements are on foot which might never have been started, and others have been revived which might have been allowed to sleep on for decades, purely because of some of the lessons learned through the experiences of the last 18 months. The "Never Again!" determination is heard in all of these discussions, and in that spirit is being laid the basis of many an important scheme. The Tentonic organisers, scientists, and industrial magnates may not have foreseen that one of the consequences of the growth of Prussian militarism and the efforts to attain its ideals (!) would be the bringing up to a higher state of efficiency of the organisations and productive facilities of the countries which had previously been the Tenton's prey, and the fuller utilisation of natural resources so as to ensure a greater measure of independence. Germany, by her very ability to conduct hostilities in the way she has done, because of her vast industrial works and organisation, and her capacity for holding out economically, has been forging in the minds of her enemies a weapon which will increase their ability to deal with her economically and prevent her commercial inroads after hostilities have ceased. Some of the movements may take long to mature or to develop into actual works rendering the service they are projected to provide; it may be years before some of them exercise any really substantial effect upon the situation. While it is impossible to conjecture what the immediate after-the-war consequences of such investigations and schemes may be, one thing is clear, that by practically compelling—unintentionally—Russia, France, Italy, and ourselves to look into such matters and devise plans and measures for increasing our efficiency for the future, Germany has made a rod for her own back—a rod which we trust will not be easily broken. What we have to see to it is that these plans and schemes are not allowed to end in talk.

One measure of the kind that we have in mind hails from Italy, where the initial steps in connection with a scheme proposed for the utilisation, on a vast scale, of the water powers still remaining unemployed in Italy, are being taken in the current week at Milan, in the presence of a number of members of Parliament. At the last meeting of the Association of Electricity Supply Works, Signor E. Conti drew attention to the importance which a greater use of water powers would have in regard to the national defence, the rendering of the country independent to a great extent of supplies of coal from other nations, the extraction of iron from the ore, and the production of fertilisers. As a number of members of Parliament have expressed the desire to be specially informed on the subject, Signor Conti has arranged to give a first lecture this week, which is to represent the initiation of a crusade in favour of the development of the "white coal" resources of the country.

Lead.

THERE has been a remarkable outburst of strength and activity in lead during the last few weeks, the supplies coming to hand and available for disposal being quite out of proportion to the demand experienced, and the result has been a very active market at prices showing rapid appreciation. The inquiries which found the market short of material in this way came almost

entirely from the hands of munition firms in this country, there having been a lull in export buying, particularly from Russia, while generally consumption has, of course, become a thing of the past. It is, indeed, reported in some quarters that there is a disposition among manufacturers of pipes and so on to resell part of their holdings of metal, owing to the enormous price appreciation, and the fact that general merchant business has come almost to a standstill. The Russian demand, which some months ago constituted the great feature of the market, has become less aggressive, and one steamer, indeed, which recently took on board between 2,000 and 3,000 tons of lead for Archangel has not sailed at all, and will probably be headed for some other port when she does clear. Supplies coming forward are by no means excessive, and so long as the freight position remains as it is, any material relief is out of the question. There are believed to be considerable stocks of metal in Spain and also in the United States awaiting steamer room to bring it to the centres of consumption, while the Mexican output is certainly increasing. There is said to be little or no scarcity of lead for forward shipment, and this although prices have been moved up in a sensational fashion under the spur of demand. It has been well said that while there is no real scarcity of lead in the world there is a very pronounced scarcity in the centres where it is most needed, and this seems pretty well to sum up the entire situation. The outlook, however, appears to indicate a continuance of high prices for a prolonged period, though it is possible there may be sharp fluctuations, especially if sellers occasionally come forward and find the market temporarily bereft of buyers.

One of these fluctuations has now developed as the result of the determination of the Ministry of Munitions to put a stop to the speculation which has been largely instrumental in bringing about the present extravagant level of values. It is the intention of the authorities to place lead under the "Defence of the Realm Act," which prohibits dealings except under permit. Official intimation to this effect has been given to the London Metal Exchange, and the result was a sharp drop in prices.

Financial Troubles at Buenos Ayres.

THE financial situation of certain countries in South America was rather critical before the outbreak of the war in Europe, and the subsequent occurrence of hostilities merely served to aggravate the position of affairs in that part of the American continent. Although improvements have recently been reported to have taken place in one South American country, probably a first instance of a great city—in that part of the world—being unable to meet its payments for public lighting, has arisen in the case of Buenos Ayres, of whose development in many directions so much has been heard in recent years. According to a local newspaper, the City Council has got in arrears in its payments both for gas and electricity, so that a sum of more than \$1,049,000 was owing to the *Compañía Primitiva de Gas* in November, and \$900,000 to the *German Transmarine Electricity Co.*, of Berlin. In order to meet these payments, the City Council has approved the allocation to the gas company of bills for the amount due, having a currency of six months, and bearing interest at the rate of 6 per cent. per annum. It is stipulated that the bills can be renewed for a further term of six months, the currency of six months having been fixed so as to enable the bills to be discounted. In the case of the electricity supply company, which had instituted an action against the city, in which it was sought to secure a partial settlement of the claim by setting the taxes payable by the company to the town against the amount owed by the latter to the former, a compromise has been arranged whereby six months' bills for \$900,000, bearing interest at the rate of 6 per cent. per annum, and maturing on July 31st, 1916, are to be handed to the company. In addition the account for supply in the December quarter is to be partly equalised to the amount of one-half of the taxes payable by the company in this month, whilst the remainder will be settled by bills falling due in April, but yielding no interest. This process will be continued until October, and may be extended further by mutual agreement.

OUR TRADING OPPORTUNITIES THROUGHOUT THE WORLD.

(Continued from Vol. 77, page 795.)

**Trade with
South
America.**

It must be particularly annoying to the export firms of the United States to find that the wonderful and long-cherished Panama Canal has "broken down" at a time when the various States of South America are so much in need of manufactures which, for reasons beyond their control, the Germans cannot supply, and which because of British manufacturing activities in connection with munitions of war, or else through lack of shipping facilities, we are at present unable to export. But, Canal or no Canal, it has for some time been the desire of the States to nurse South America commercially, and such attentions have been strikingly in evidence during these eighteen months of war. Expeditions big and expeditions small have been dispatched to cultivate relations with buyers and others there both for immediate and for ultimate advantage. There is not, however, an absolute certainty among our cousins that they will permanently hold what they now have so excellent an opportunity to gain. They have come up against the influence of European capital—and if anybody has a hold on South America on that ground British investors have. They have also come up against the hold that Teutonic influence establishes when German capital initiates a public undertaking, or buys up a British one and develops it. It has too often been the British way to lend millions sterling which have not brought back to us the consequent contracts to benefit our industries. The Teutonic way has been to get a footing, to elaborately entrench, and to create by this, that, and the other way, under the terms of the concession, or by local arrangements, a system and an atmosphere which made it necessary for German apparatus and supplies to be employed, and so the capital put

**Investors' Gain—a
Traders' Loss.**

down, either to buy or to develop the undertaking, has brought both dividends and contracts too. An excellent arrangement no doubt for the other fellow, and one that makes us regret that it is ever possible for a British undertaking abroad to be sold to foreigners at however high a premium on the shares. The loss or thereabouts of a coming market for manufactures over a period of years, may mean far more to us industrially than the mere premium gain that came to the few lucky shareholders. These bargains look very nice on paper when we consider them from an investor's point of view—we like to read of men (other men!) making money out of electrical investments, but we do not like the transfer to what we now call "enemy hands," of undertakings which carry with them valuable trading facilities and connections. The United States then is up against European financial influence in its efforts in certain South American fields, and some of its advisers are not too confident that efforts to establish far-reaching schemes for the development of permanent future trade connections are going to yield all that the apparently favourable factors would suggest as being probable or possible. There is no doubt whatever that very

**To
Americanise
the
Student Mind.**

determined efforts are being made there by American manufacturers, under the auspices of the U.S. Government, to take advantage of the present disabilities of European countries. Those efforts have been the outcome of a scheme which is outlined in a recent Commerce Report. One part of the scheme—a feature with which we are by no means unfamiliar—is this:—Arrangements are being made for

giving training-course positions in American manufacturing plants to young South American technical graduates. Several firms have expressed their willingness to take these students, and it is now proposed that the scheme shall be extended to the training of South Americans in the offices of commercial houses. The advantages of the scheme are obvious. In some cases the students will return to their own countries as representatives of American houses. They will be well-equipped, native representatives, familiar with conditions in their own countries, and naturally loyal to the firms with which they have studied and worked. Even if later they enter business for themselves, or engage in entirely different lines, it is confidently expected that their influence will continue to make itself felt. Señor Eduardo Carrasco, chief of the commercial section of the Foreign Relations Department of Chile, who is at present visiting the United States to make a study of American commercial methods, is also establishing committees in the more important American cities to help young men, selected by a committee in Chile, to find positions in the universities, factories, or commercial houses.

As we say above, we are used to this sort of thing.

**Father and Son:
A Family
Obligation.**

Particularly have British electrical engineers who have followed occupations in such countries as China, had very good reason for knowing how important a card this was in the hands of German electrical manufacturing works. The managers or heads of such works in Berlin or elsewhere in Germany took the long view of things, and the readiness with which they would offer to take the sons of influential Chinese gentlemen into their electrical works in Europe, and give them several years' training, is perfectly familiar to those of our readers who followed the "Correspondence" columns of this journal a few years ago. The young Chinaman duly takes up his place in the German factory, the father is placed under an obligation to the company, and not many months after, a personal letter from some distinguished official or other of the concern is received by the fond parent reporting the "progress" that his excellent son is making, and suggesting in the closing sentences that the time may now have arrived for orders for the requirements for a certain electrical installation, in which the said parent is interested, to be placed with the works where his dutiful and promising son is employed. That is the German method. You have one of the examples of the British way in evidence at the Hong-Kong University, where, by the foresight of Professor C. A. Middleton Smith, by the generosity of a number of British manufacturers, and by the efforts of this Journal, there exists to-day in the engineering laboratories a collection of machinery and apparatus destined to make a lasting impression upon the minds of thousands of young Chinese engineers who, after completing their studies, will go to the different parts of China with the names of British engineering firms "at their finger tips" so to speak. But we have no monopoly of this method of foreign education. Our rivals practise it wherever they get the opportunity.

**Can We
not do
More?**

Whether this country has ever done so much as it ought in trying to educate the minds of potential buyers who pass through the engineering and other colleges in the countries which must depend on industrial nations for many years to come, is at least doubtful. Whether we have given sufficient facilities for such students to come into our factories and so familiarise themselves with British manufactures and abilities is also a point we should do well to consider. We hear that one organisation is already trying to arrange such a matter effectively in the lands of one of our chief Allies. We may be pretty certain that Germany will not do less of this kind of

thing again, if she gets the chance, and from what we have said in the foregoing it is clear that the United States is going to adopt the practice as one of the long ways of winning South American trade. In the North, the geographical nearness of Canada has given the States untold advantage. In the South, Canal or no Canal, the problems are very different. There is no United States atmosphere; there are strong competitors on the ground in normal times—competitors whose hold is good, whose roots are deep, and whose knowledge of the markets is not a thing to be scoffed at; so the problems must be tackled in a different way. It seems to be thought, however, that if South Americans can be Americanised as many Canadians have been, practice may be inclined to pursue a favourable course for the United States in time. Part of that Americanising is to be found in receiving South Americans into United States works and colleges.

The greatness of the engineering potentialities of Siberia has been frequently referred to in these pages. We have lately conversed with young Colonials who have come Home at the Empire Call after years of daring and interesting prospecting work in certain parts of Western and North-Western Canada, and their stories of what the future has in store for those who make the venture there are as fascinating and entrancing as the fairy tales of our childhood and as wonderful as the tales of the Arabian Nights. But for the time the war-fiend holds the key. The movement is Homeward for our sons—not to the lands across the seas at present unless they have “done their bit” and can do no more. Population has re-traced its steps in order to aid in our endeavours to wipe out the menace of the hydra-headed monster of Central Europe, so that the Colonial Britisher in a free, pure atmosphere, may carry on his occupation knowing that the heritage of Freedom for which our Empire stands is not endangered. Population more than ever will our Colonies require, and after the war they will doubtless gain more than they have lost by the war. The financial position, too, has been a serious factor in Canada for some time, but munitions work and a glorious harvest will ere long assist to relieve the situation—indeed, already the tide of prosperity has risen in the East, and it will doubtless soon reach the West. The Canada of the future will be a different land, and the character of the people will be somewhat changed. The huge munitions contracts are not being executed without leaving their mark upon the manners, habits, occupations, etc., of many of the people, and Canadian peace-time manufacturing operations will probably be more mechanical in future than in the past. May-be some of the lines of manufactured goods that were freely

brought up over the border from the States will be Canada-made. For that we must wait and see, but what is happening at present will form one of the new factors to be taken into account in considering the future position. We hazard no opinion at the moment regarding the future of British electrical importations into Canada, for the position is a peculiar one. We have our hands so full, or prospectively so full, with markets nearer home, and possibly on some grounds easier to work, that there will be less reason to begrudge the States the greater opportunity for strengthening their hold on the market that the war has inevitably brought to them. We shall do well, however, not to neglect the market, for after a few years, given population and financial ability, the strides that Canada will take out West will be large indeed; where the railway goes there will be a need for electricity, especially remembering the great hydro-electric traction work that is now in hand or planned, and if we can meet the need we shall have at any rate a share of the spoils.

The Outlook in Canada.

The Promise of Siberia.

But we did not start out to write about Canada—we were led on to it by our sentence about Siberia—to which it has been likened by those who have with eager eyes studied the position in their travels through both countries. Canada is a land of promise, of course, but Siberia is a land of promise too, almost beyond the limits of our poor industrial imagination, and the United States trade authorities, who know something about the matter, have, in one of their Commerce Reports, circulated among American firms some information which has been prepared by a special Canadian Trade Commissioner on “Trade Development in Siberia.” So great is the Russian and Siberian territory, and so vast the population, that when once the wheels of what we may term ordinary industrial life have been set smoothly running, the requirements for machinery and many engineering supplies will be immense.

British Firms Co-operate.

The opportunity has been recognised for years by a number of British engineering firms, though we suspect that so successful have been their efforts in Russia that they have not needed as yet to push their efforts on to those farther eastward points which form part of their original project. We congratulate them upon their success, and we welcome with feelings akin to delight the co-operative efforts which have been set on foot by the seven British electrical manufacturing concerns who have grouped themselves for Russian business in a separate organisation—the Electrical Manufacturers’ Company of Great Britain, Ltd.—to which we referred in our issue of December 31st, 1915. We may return to that most timely and promising scheme later, but meanwhile we quote the comments of the Trade Commissioner who has reported upon Siberia. He finds that during recent

Developing Siberia.

years a very marked progress has taken place, due largely to the opening out of transportation facilities—what a building of railways there will be in many parts of the world when this war is done! The whole hydrographic system that supplements the Trans-Siberian Railroad is bisected by that railroad, and for thousands of miles, north and south of the line, there is provided a splendid means of cheap access to vast areas during the greater portion of the year. These facilities are being continually increased by the construction of new railways and by river-improvement works, which aim to connect the whole river system of the country for practical transportation purposes. Trade expansion is shown by the business of the fairs and markets, the carrying trade returns of the chief centres of distribution, the growth in the number of banks, forwarding houses, insurance offices, etc., and the extraordinary activity in the building trade. The census figures of 1910 show an increase in the number of factories of 75 per cent., and of 150 per cent. in their output over those of 1900. Flour mills, sawmills, and breweries have been responsible for a considerable portion of the increase, and practically the entire equipment of these and similar undertakings was imported. Moscow merchants control fully 50 per cent. of the trade of Western Siberia. These firms have branches in the principal centres, but the purchases for their stores are made in Moscow. The growth of the country and the establishment of strong local independent firms is, however, tending to produce more direct buying. Most foreign firms have been content to leave their representation in the hands of a single firm in European Russia, and to pay little attention to the Siberian market. Germany has, however, by trade grouping, and the employment of competent travellers speaking the language, been able to build up a direct trade on a satisfactory basis. This trade grouping, with a view to sharing the somewhat high expense, is now

A Period of Change.

recognised as being of first importance, and local agents urge that responsible representatives of grouped industries should visit the country and get into touch with local conditions. Here, as in Russia, circumstances require the granting of extended credit, but the cost of credit can be realised in the prices. It is practically a question of finance—money out on loan. Shall we ever be able to employ that weapon to a sufficient extent to meet our rivals on their own ground? Electrical supplies have hitherto been almost entirely in the hands of Germany, but, with the depletion of accumulated stocks, and the stoppage of that source of supply, electric light fittings, lamps, bell-pushes and fans, meters, as well as dynamos and other plant, are said to be urgently required. And so we see Siberia holding out her hands of welcome to Allied electrical and engineering manufacturers.

(To be continued.)

BRITISH ENGINEERING TRADE EXPANSION.

By EDGUMBE BRIGHTEN.

It is the opinion of many that the time has now arrived when the question of after-war trade should be reviewed.

If Great Britain is to make the most of the advantages it will have obtained at the termination of the war, active steps must be taken to prepare the markets of the Empire and neutral countries for the enormously increased output of material which will be available owing to the extension of factories which are now engaged upon war work.

An important step in a campaign to promote the extension of our trade would be to form an association covering all the engineering and hardware industries. Such an association should seek the co-operation of all existing trade associations, and should be governed by a council consisting of representatives of such. The chairman or president should be a neutral personage, not connected with any other association.

The work that such an organisation should carry out, to be effective, must be very extensive. Its first duties would be to initiate a campaign within the British Isles by means of meetings, articles in the Press, etc., to bring home to the people the value and quality of British goods, pointing out the fact that Germany has been able to wage this war to a large extent through the support we have given her by purchasing goods and financing her industries in the past, and showing that one of the surest guarantees of Peace in the future would be the permanent annexation of enemy trade.

The association should interest itself, and use whatever influence it possessed, in protecting the interests of its members engaged in export trade.

The activities should be of the most wide-spread character. Capable representatives, chosen from local residents (British) who have had experience of some years' standing in such country to which they may be appointed should be sent to the great trade centres abroad.

The policy that has been adopted in the past by other associations of appointing people without experience, or without knowledge of the country, has proved its futility by its lack of usefulness.

Such foreign or colonial representatives would have, beyond the primary object of interesting natives of such country in British goods, the duties of keeping the association advised as to the possibility of future business. Also, it would be such a representative's business to encourage friendly legislation as to tariffs favourable to British goods.

The immense benefit that would be obtained by

members of the association if its representatives abroad were organised on such lines as to be able to supply information in relation to business in prospect, would be too high to estimate.

The system that I put forward is that the agent or representative of any members of the association in any country should be kept advised as to possible new business by the resident representative of the association in such country, instead of information being sent to London before being disseminated. To obtain information of value, the representative would have to be an expert organiser.

The cost of maintaining such an organisation would be high, as I do not think a representative suitable for such an appointment in any country could not be found under £800 to £1,000 a year. A cheap man would be of no value to the association. In some cases this estimate would have to be very largely exceeded.

I think that as each industry represented in the association should have its interests properly maintained, a section covering each industry should be arranged.

One of the chief reasons why Germany has been so successful in pushing her engineering products in foreign countries is because she has offered many inducements to young men—sons of possible purchasers or manufacturers of industries—to go to Germany to receive their technical training. The importance and value of doing this is, of course, easily apparent to anyone, for to train a boy just as he is reaching manhood, and is susceptible to influence, is to create a life-long sympathiser. From personal experience, I have found it always most difficult to do business abroad when the prospective buyer had received his instruction in Germany, as he invariably thinks in German and believes in German methods.

One of the great difficulties with which we in this country shall have to contend after the war will be labour. I think it will be absolutely imperative that the situation be explained to the trade unions and to the Labour leaders. Also, one of the troubles that will have to be faced by manufacturers will be the continuance, and possible extension, of the policy "Ca Canny" or—limitation of output. It should not be assumed that the limitation of output is caused entirely by socialistic or labour principles, because one of the chief reasons that brought about the adoption of modern trade union restrictions was the frequent tactless behaviour of certain employers. To be more explicit, the limitation of output has frequently been brought about by fear on the part of the workmen that the "piece rate" would be reduced. At this point I leave the question, finally, believing that careful, cautious, and unbiased negotiation would do much to reduce the evil here mentioned.

Unless the greatest care is exercised by His Majesty's Government after the war in disbanding the armies then in being, the fear of unemployment will be so great that all possible restrictions which can be put into force by the trade unions will be exercised to their utmost.

To combat such a policy, an extensive campaign should be inaugurated, to extend to trade unions, the Labour leaders, and the workmen themselves, so that there would be no reason for the fear of unemployment if labour would realise that the securing of markets and trades now dominated by the Central Empires should be effected by this country. From my experience and knowledge of many Labour leaders, I am convinced that they and the men could be interested. The spirit of patriotism, and the knowledge of what large wages mean, will make the near future a most opportune time for such a campaign.

I may be accused of laying too much stress on this question of labour, but I believe that unless action is taken, the time immediately succeeding the war

will hold almost as much danger for this country as that with which we are now faced.

The fact that thousands, hundreds of thousands, perhaps millions of men will be released on to the market of labour after the war, is not fully realised. Industries and factories will have to be reorganised, and I fear that, in the meantime, the percentage of unemployment will be very high, with the cost of living not reduced. The situation that may arise is not difficult to imagine.

The expansion and recapture of British trade should be commenced as soon as possible, so that the seeds may be sown and the crops ready for reaping at the cessation of hostilities.

COKE AS A BOILER FUEL.

By E. W. L. NICOL, A.I.E.E.

THE article on the above subject which appeared in the ELECTRICAL REVIEW for December 31st (page 839) is of considerable current interest in view of the present high cost of coal and shortage of supplies from the usual sources; and, on the other hand, the plentiful supplies of coke available, particularly in districts so affected.

At many of the more important gas works during the present period of maximum demand for gas, the output of coke is to some extent controlled by increasing or decreasing the manufacture of carburetted water gas in its relative proportions to that of coal gas, as carburetted water gas plant is a consumer—not a producer—of coke. The residuals from which the much required, high explosive by-products are derived are, however, obtained only in

material reduction in capacity or efficiency. In this case the ignition arch has been retained, and satisfactory ignition is effected by admitting a thin layer of coke slack with the coke, which is graded to convenient size. With this method, air leakage into the furnace is eliminated and normal capacity and efficiency are obtained.

To break and grade coke to suitable size, for either coking or sprinkler-type stokers, should not be a matter of very great difficulty. An ordinary coke cutter, absorbing about four or five H.P., will deal

FIG. 2.—RATES OF COMBUSTION OF COAL AND COKE.

effectively with 30 tons per hour at a very insignificant cost.

The results of other evaporative tests, given in the previous article, on ordinary fixed grates showed the higher evaporative value (about 10 per cent.) of coke, as compared with coal of a higher calorific value, obviously due to the smaller proportion of excess air necessary in burning a non-volatile fuel and consequent greater proportion of CO_2 obtainable in the waste gases.

As to the relative cost of coal and coke as boiler fuels, due regard must be had to quantities, locality and delivery facilities. Taking the river Thames, prices for washed slacks having an average of about 12,500 B.T.H.U. have lately been about 30s. per ton, including delivery, while coke of equal calorific value, and, as it has been shown, of considerably greater value to the user, may be obtained in the required quantities at considerably less cost. Having these figures in mind, and the fact that the normal surplus of coke exported, according to a recent Home Office report, is about two million tons annually, there should be little hesitation in making, not temporary and improvised, but permanent provision to utilise these sources of supply. The surplus normally available on the Thames is probably from 400,000 to 500,000 tons of coke and coke breeze annually.

From the national point of view, which is one of considerable and growing importance, every ton of coke made from sea-borne coal and used in towns and cities in place of rail-borne steam coal will relieve the congestion on our railways to that extent, while the equivalent, in the case of Welsh coal, which is less suitable for carbonisation, would be released for export.

In considering the question of substituting coke for coal fuel in a power station handicapped by being laid out and equipped to use a uniform class of coal only, the problems of storage and capacity of machine stokers and boilers naturally arise. The reserve stocks of coal usually carried by gas authorities are necessarily considerable and, to a coke-user buying under contract, would, of course, be available.

FIG. 1.—CHAIN-GRATE STOKER ADAPTED FOR BURNING COKE.

An auxiliary hopper (B) for coke is fixed below the usual hopper (A), and the coke is fed upon the grate with a thin layer of coal on the top of it to ensure its ignition.

the process of coal gas manufacture. This fact, coupled with the curtailment of export and shortage of labour, necessitates fresh outlets being obtained in directions which do not entail the employment of extra labour other than grading or loading into trucks or barges.

The method of adapting a chain grate to burn coke, as illustrated in the previous article, is simple, and, no doubt, effective, but the air leakage through the improvised grate bars in the feed hopper would result in relatively poor thermal efficiency and low evaporation being obtained. The photograph reproduced herewith shows how chain grates working in this country under boilers of 20,000 lb. per hour capacity, have been modified to burn coke without

This consideration should to some extent offset the disadvantage of the relatively greater bulk of coke. At normal rates of combustion, and with equal draught, the steaming capacity of a hand-fired boiler will be reduced by about 15 per cent. to 20 per cent. by substituting coke for coal of similar calorific value (see diagram, fig. 2). There are, of course, ready means of supplementing an inadequate draught, but in the case of stokers of the coking type the problem is more complicated. To start from the beginning, there are obvious bargaining and other advantages to be realised by installing a stoker that will equally well handle coal, coke, coke breeze, and possibly anthracite, and it is a matter for considerable satisfaction that such a stoker has been developed and is now receiving the patronage it deserves in this country. While on this subject it may be profitable to anticipate the trend of the findings of the several committees appointed to deal with the question of fuel conservation and smoke abatement. The national requirements in high-explosive material and other by-products of coal carbonisation will, no doubt, be held to be paramount. The future tendency will therefore probably be to discourage shipment of coking coals, and gradually to limit export to anthracitic non-coking and other coals less suitable for carbonisation. The resulting output of coke will necessitate improved means for its economic combustion under steam boilers, in gas producers and for domestic use.

THE MAGNETIC HAND.

ONE of the lamentable results of the great war was the return of many thousands of our brave comrades, martyrs to the cause of liberty and progress, crippled for life by the loss of a hand or arm. Obviously it is of the first importance to adopt every possible means to enable these men to resume their customary occupations, by the provision of efficient substitutes for the missing members. With their usual foresight, our enemies are taking steps to cope with this difficult problem, and in a recent issue of the *E.T.Z.* Prof. Klingenberg, one of the leading electrical engineers of Berlin, describes a number of devices which have been developed for that purpose. We reproduce herewith the illustrations which accompany his article. Fig. 1 shows an armlet which can be strapped on the stump of the arm, and is provided at the end with a pot magnet; the latter is

FIG. 1.—MAGNETIC HAND HOLDING FILE.

mounted on a ball and socket joint, so that the magnet can be brought into any desired position, and the magnet can then either be clamped firmly or left movable with a moderate degree of friction. The magnet is supplied with current by means of a flexible cord and a plug, the current being switched on and off by the movement of some

other part of the body such as the foot, the chin, or the sound arm, or by a particular movement of the injured arm itself. With this device all articles made of iron can be held in a powerful grip for any length of time, and can be lifted and moved about or released, at pleasure. Hence the magnetic hand is suitable for all jobs in which iron tools or iron articles are employed. As a rule, therefore, the tools need not be specially made to suit the requirements of the maimed man. In the example illustrated in fig. 1, the magnetic hand is holding the end of a file, and being movable with regard to the armlet, offers no hindrance to the control of the file with the sound arm.

Fig. 2 shows a plane which is fitted with a small iron plate for the magnet to take hold of, and which is handled exactly like any other plane. Stamping machines working on sheet-iron can be managed as well as with a sound hand, or even better, for the magnetic hand can grip the smooth

FIG. 2.—PLANE FITTED WITH IRON PLATE.

surface of the sheet. Work can be put into lathes, &c., with the aid of the device while the sound hand makes the adjustments. Tools which are not made of iron can often be easily fitted with iron plates, and switchgear can be manipulated if the levers are so fitted. Magnets of different sizes and tractive forces can be fitted to the same holder.

The plain magnet, as above described, suffices for a variety of simple operations; improvements in the device will readily suggest themselves in particular cases. By means of a switch to fix and release the magnet alternately, the rotation of iron articles can be effected. Special tools can also be devised, such as those illustrated in figs. 3 and 4, which represent tweezers, pincers, and pliers, actuated by electromagnets. The author further states that there is no special difficulty in providing for the movement of the forearm with respect to the upper arm, the gripping action of artificial fingers, and of the thumb, &c., and he concludes by pointing out the exceptional facilities afforded by electric

FIG. 3.—MAGNETIC TWEEZERS.

FIG. 4.—MAGNETIC PINCERS OR PLIERS.

power for fulfilling these various functions, as compared with other agencies. The use even of a portable battery to energise the magnet when away from an electrical installation is not overlooked. No stone should be left unturned to aid our crippled workers, and we trust that good results may be obtained from these interesting suggestions.

THE ELECTRIC PROPULSION OF SHIPS.

In a paper read before the INSTITUTION OF ENGINEERS AND SHIP-BUILDERS IN SCOTLAND by Mr. J. DORNAN, the relative efficiencies of different systems of propulsion of ships were discussed. The author stated that turbo-electric systems had been fitted into one ship in this country, four in the United States (including a battleship now building), and one ship in Sweden. Seven steamers were building in Sweden which would be fitted with the Ljungström system of turbo-electric propulsion, aggregating 10,200 H.P. The turbine, however, had not secured a firm hold on the average tonnage of this country, mainly owing to the high turbine speed necessary for economy. He had worked out the data for the equipment of a ship displacing 21,000 tons and running at 19½ knots, on seven systems as follows:—

(A) Two sets of quadruple-expansion steam engines driving twin-screw propellers direct at 85 R.P.M.; saturated steam at 210 lb. pressure per square inch; vacuum in the condensers of 27 in.

(B) One set of turbines arranged in series on four shafts running at 290 R.P.M.; saturated steam at 200 lb. per square inch; vacuum 28 in.

(C) Similar to (A), only steam is superheated 200 deg. F.

(D) As (B), only steam is superheated 100 deg. F.

(E and F) Geared turbines arranged on two shafts. The former has two turbines running at 1,000 R.P.M., and driving twin-screw propellers at 200 R.P.M. through hydraulic gearing of the Föttinger type. The latter has four turbines arranged in series, driving the propeller shafts through Parsons mechanical gearing at 1,800 and 160 R.P.M. respectively. Superheat, (E) 200 deg. F., and (F) 100 deg. F.; working pressure 200 lb. per square inch, and vacuum 28½ in.

(G) Two shafts driven at 85 R.P.M. through Parsons mechanical gearing by electric motors running at 500 R.P.M., driven from two Ljungström turbo-dynamos which run at 3,000 R.P.M. Vacuum 28½ in., working pressure 200 lb. per square inch, superheat 260 deg. F.

As the rotors revolve in opposite directions, the relative revolutions of the blade-disks are 6,000 per minute, and, therefore, only one quarter the number of blade rows are necessary as compared with a single-rotation type turbine of 3,000 R.P.M.

The dynamos and motors are three-phase A.C. for 2,500 volts. The manoeuvring is mainly done electrically, speed regulation being obtained by resistances in the motor circuits when manoeuvring, and by altering the speed of the turbines when reduced power is required for a lengthened period of time. Reversal is effected by interchanging the poles of the phases.

The figures calculated in the table are based on actual performances of machinery recently built.

By mechanical efficiency is meant the sum of all the mechanical losses between the point where the horse-power developed is measured and the power delivered to the propeller.

The table shows the steam and coal consumptions of the various designs, also weights of machinery and particulars of extra deadweight and cubic capacity.

By primary horse power in line 3 is meant the power which must be put into the prime mover to provide the necessary

horse power in line 2. The losses in the mechanical gears of design F have been taken at 2 per cent., and the primary horse power of the turbines is, therefore, 21,800. In addition to the mechanical gear losses as in F, design G has losses due to the dynamos, cables, and motors. These amount to 1½ per cent., including a 2 per cent. loss in the helical gears.

As the turbines used in E and G always rotate in the one direction, no matter whether the propeller is going ahead or astern, and thus eliminate the troubles due to astern turbines, high superheats are used. Design G, having Ljungström turbines, can safely use as high a superheat as 350 deg. F.

The distance run by the ship in nautical miles per ton of fuel burnt is shown in line 12. These figures are very important, and from them the economies in line 13 have been calculated. This is the most just and accurate method of computing economy, for such variables as horse powers, revolutions, and steam consumption per primary horse power are eliminated.

It is difficult to calculate the years for depreciation for each type of prime mover, but it may be safely stated that design G will be an efficient and modern one many years after A is obsolete, as the probability of a new invention increasing the efficiency of G is very much more remote than of one improving A. An attempt to state the years of life is shown in line 23. These figures are extremely important, as the rate of depreciation being decreased from 6½ per cent. of A to 4½ per cent. of G means some £3,000 per annum.

Line 25 shows the net annual return on the cost of ship. These figures are the most important in the table. They have been calculated after allowing for the usual deductions from the gross returns, and for the years of depreciation stated in line 23.

It is hoped that the comparisons made will clearly show that by spending 4½ per cent. more money in the first instance, the net annual return may be increased from 7 per cent. in A to 15 per cent. in G.

The selection of a 21,000-H.P. 19½-knot design forms a good point to view the application of the various alternatives to ships having higher or lower powers and revolutions corresponding to the power and speed.

If the lower scale be first considered, machinery types B, D, and E become more and more inadmissible, as the horse-power and revolutions decrease, on the grounds of extravagance in steam consumption, of excessive weight, and abnormal dimensions. Types A and C are applicable to the lowest of powers and revolutions. The steam consumptions of these types, considered alone, favourably compare with some of the other designs, and it is the excessive weight that places the piston-type machinery at a disadvantage.

Types F and G are applicable to the lowest powers, with the stated degree of economy maintained and very often improved.

Taking now powers and corresponding revolutions, higher than in the case examined, types A and C fall out of the running very quickly, as the weight of machinery and necessary space become too great.

The remaining designs are all applicable to high powers with even better results than given in the table. Type F would, however require to have four shafts with eight or more turbines for higher powers, on account of the dimen-

sions of the general trend is, therefore, at a disadvantage over E or G.

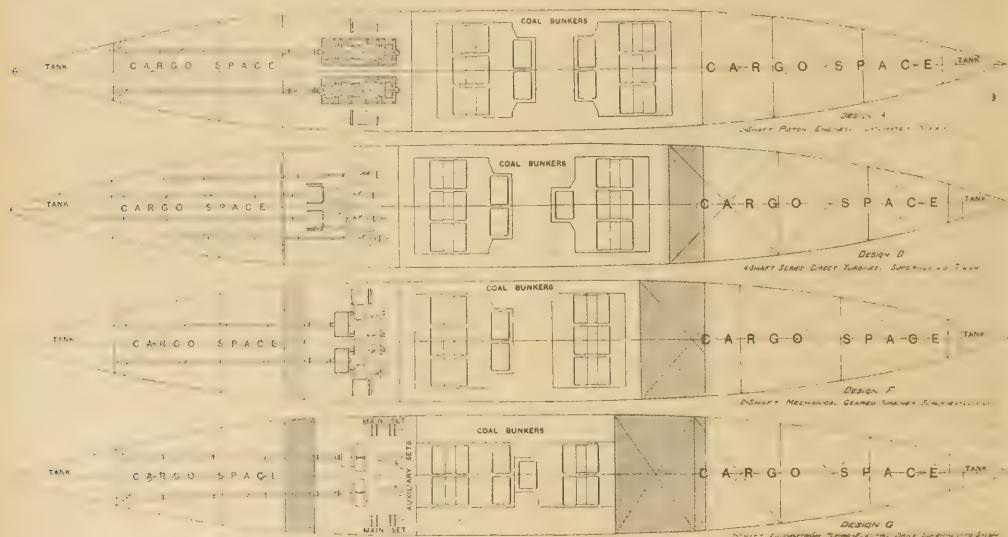

With a view to securing further economy in turbine-driven ships, it is recommended to increase the propeller revolutions, so as to produce machinery which will be small and light, and also decrease the steam consumption, so that a larger number of nautical miles may be run per ton of fuel than in ships having slower-running propellers. The machinery would also decrease in first cost, not per unit of weight, which would, of course, increase, but per unit of power, which is the more important factor. The decrease in fuel used, and the decreased capital cost of the ship in conjunction with the increase in cargo capacity, will result in a commercial success satisfactory to all concerned.

DISCUSSION

Mr. P. A. HILLHOUSE said that the centre of gravity of vessel G with Ljungström turbines would be about $3\frac{1}{2}$ ft. higher than design A with reciprocating engines, which would probably necessitate an increase in breadth, or a reduction in the displacement, even if the Ljungström turbine had the same height of centre of gravity as the reciprocating machinery. Mr. Dorman showed the increases of deadweight, as compared with the ship having reciprocating machinery, and he also showed the increases of cubic capacity. In the Ljungström turbine ship it would not be possible to utilise all the increase in deadweight, owing to want of stowage space, and probably some compromise would have to be adopted.

Mr. W. D. McLAREN compared the turbo-electric gear G with the mechanical gear F, and pointed out that, in the

electrical system, design G, yielded the maximum ratio between speed of prime mover and propeller shaft. The Ljungström turbine, owing to its highly ingenious construction, was designed for a maximum obtainable superheat, and the resultant economy stated in Mr. Dorman's paper was by no means a speculative one. The Swedish boat *Mjölnär*, of 850 s.h.p., with Ljungström electric-turbo drive, had been running since December, 1914, between Stockholm and Gothenburg, and her performance compared well with her sister ship, *Miner*, running on the same route, and fitted with triple-expansion reciprocating engines. With similar coal of 13,500 B.T.U., the electrical ship's daily consumption in 24 hours was 9 tons when developing the equivalent to 940 h.p., as compared with the consumption of the *Miner* of 15 tons under the same conditions of power, speed, weather, and displacement, showing a saving of 40 per cent. The coal consumption reduced to 1 h.p. in each case was .89 lb. for all purposes in the electrically-driven ship, and 1.52 lb. in the ship with reciprocating engines. The steam conditions in the *Mjölnär* were:—Pressure 200 lb., superheat 190 deg. F., and vacuum 29 in.; in the *Miner*, saturated steam, pressure 180 lb., and vacuum 26 in. (barometer 30 in.). An aggregate of 10,000 h.p. was now in course of construction in Sweden for five additional electrically-propelled vessels, based on the performance of the *Mjölnär*, and approximately 200,000 h.p. in Ljungström turbines was either running or in course of completion for land work. It might be interesting to state the results of a 5,000-kw. Ljungström turbo-alternator, which would shortly be running in one of the London power stations. At 40 per cent. of normal full load, the consumption was 8.1 lb. per B.H.P. per hour; at full load the consumption was 7.34 lb. per B.H.P. per hour, in each case for turbine only. The

SHIP PLANS SHOWING THE INCREASED CARGO SPACE (SHADED) AVAILABLE.

former, the revolutions were chosen at 85 per minute, and in the latter 160 per minute. The net result of this change was that he got improved propeller efficiency, and so saved 1,350 h.p. The steam consumption per h.p.-hour of the main engines was only 7.4 lb. from the data supplied, this necessitated a turbine efficiency based on the Rankine cycle of 83 per cent. He was aware that the Ljungström turbine showed a higher efficiency than any other which had yet been constructed, but he was not a little chary in placing it at this figure for comparative reasons. Using the same propellers in F and G, and increasing the turbines of G at about 10 per cent. higher efficiency than in F, the overall efficiency of G was still at least greater than the overall efficiency of F. If such were the case, the other considerations would be levelled down. He was aware of the difficulties of admitting superheated steam to an astern turbine which might have been working at a comparatively low temperature, but there were ways of overcoming these difficulties, such as adopting astern turbines of the impulse type. It would be noted that the greater gain in the saving effected by each type of machinery, as compared with design A, was due to the extra deadweight that Mr. Dorman estimated could be carried; even though this was not mentioned by Mr. Hillhouse, there was no doubt that it did not follow that the cargo accommodation was fully utilised every voyage.

Mr. H. S. PORTMAN said that design A, he understood, represented actual figures, and design B represented the trial figures of one of the most recent turbo direct-driven Atlantic liners. The performances of the other designs appeared to him to be based on sound and well-established data. The

turbine ran at 3,000 revolutions per minute, corresponding to a relative rotation of 6,000 revolutions per minute. The thermal efficiency of the turbine at normal full load, including condenser, worked out at the excellent figure of 79 per cent. The efficiency of the alternator at full load was over 96 per cent., which included exciting and ventilating losses. These results were in close agreement with Mr. Dorman's predetermined figures. Given such a cheap source of electric power as the above, in addition to the ordinary condensing auxiliaries, considerable advantage would be gained by running refrigerating and ventilating plants, sanitary pumps, steering engine, and electric lighting, electrically from the main generating sets, through an intermediate motor-generator. He felt confident that a saving would be effected in the galley and electric ovens. One of the 600-kw. exciting auxiliary sets would drive the auxiliaries and electrical winches in port, and would be a stand-by at sea. Should one of the main generating sets break down, the ship could proceed to port at about 15 knots on one set alone, with unimpaired efficiency, and with equal power on both propellers.

Mr. R. T. O. BLACK pointed out that when a rapid reversal was made a very large amount of energy was transmitted to the shafting, and if any perceptible braking effect was to take place, it must be in the turbine casing. Some indication of the probable limit in the size of the Ljungström turbine for a speed of 3,000 r.p.m. would be of great interest; the largest turbine of the type of which details were available had an output of 5,000 kw. at 3,000 r.p.m. It was understood that this output approached the limit for this speed. Referring to the electrical equipment of vessel G, the motors

appeared to have 12 poles, which seemed to be as large a number as was consistent with a reasonable power factor. Quite a number of inventors had proposed schemes having ratios of reduction between the generator and motor of the order of 20 or 30, necessitating 40 to 60 poles on the motor. No figures of probable power factors had ever been given, though, from the weights stated, very hopeful views were taken. He took it that the designers of the Ljungström arrangement found that geared motors, including the gearing, were lighter and more satisfactory than large slow-speed motors. Mr. Dornan stated that speed regulation while manoeuvring was effected by resistances in the motor circuits. These resistances, capable of handling 22,000 h.p. at 2,500 volts, must be of rather formidable dimensions. There did not seem to be any reason why this speed regulation should not be effected by varying the alternator voltage. The power of an induction motor varied as the square of the applied voltage, which should agree fairly well with the power-speed curve of the ship.

HIGH STEAM PRESSURES.

In a paper presented at a recent meeting of the American Society of Mechanical Engineers (and reprinted in our contemporary *Power*), Mr. ROBERT CRAMER discussed the possibilities of using higher steam pressures in power plants, showing by means of tables and curves the relative gain in thermal efficiency by so doing; the following is an abstract of his remarks:—

In steam engineering practice the tendency to increase the range of the working fluid has led to the recognition of well defined limits: A maximum steam temperature of about 600 deg. F., above which lubrication of piston engines and maintenance of valves and packings are difficult, and a minimum condenser temperature of about 80 deg. F. corresponding to 29 in. of vacuum, or $\frac{1}{2}$ lb. back pressure. This temperature is so near the usual cooling water temperature that a higher vacuum would require disproportionately large quantities of circulating water. The necessary size of the circulating pump and increase in size of the air pump render higher degrees of vacuum unprofitable.

If, taking these limits, all heat were transferred to the steam at 600 deg. F., or $600 + 460 = 1,060$ deg. abs., and all heat were rejected at 80 deg. F., or $80 + 460 = 540$ deg. abs., the Carnot cycle would be realised and the efficiency of the engine would be $(1,060 - 540)/1,060 = 0.491$. Thus nearly one-half of the heat transferred to the steam would be transformed into mechanical energy.

While the condition of the rejection of all heat at the lower temperature can be closely attained, it is impossible to cause the steam to absorb all heat at the higher temperature.

In the best present practice, except for slightly higher pressures in some few isolated cases, the maximum steam pressure is 200 lb. per sq. in. absolute, and the superheat is 200 deg. F. The corresponding temperature of evaporation is 382 deg. F. and the bulk of the heat is absorbed at a temperature of 200 deg. F. below the maximum. It seems reasonable to expect that the approximation to the ideal Carnot cycle, and simultaneously the economy, would be improved by using higher pressure and less superheat; that is, by increasing the temperature at which the bulk of the heat is absorbed without increasing the maximum temperature.

Even a casual reference to steam tables and diagrams confirms this expectation and reveals the remarkable fact that the higher the steam pressure the less the total heat in the steam if the final temperature be kept constant, and correspondingly the superheat is reduced with advancing pressures. This difference, while not great, is decidedly noticeable, as Table I shows (the values throughout are taken from the Marks and Davis steam tables).

TABLE I.—TOTAL HEAT OF STEAM AT VARIOUS PRESSURES.

Steam pressure, lb. per sq. in.	Temperature of steam, 600 F.					
	100	200	300	400	500	600 1,571
Temperature of evaporation, deg. F. ...	328	382	417	445	467	487 600
Super heat, deg. F. ...	272	218	183	155	133	113 0
Total heat, B.T.U. per lb.	1323.3	1317.6	1310.7	1305.6	1301.8	1298.8 1176.0

An examination of the Mollier total-heat entropy diagram shows that the amount of heat convertible into mechanical energy in adiabatic expansion to any given back-pressure is considerably higher for high pressure and little superheat than for low pressure and much superheat, if the maximum temperature of the steam is the same in both cases.

We have thus two cases making for better thermal efficiency with increasing steam pressure at constant maximum temperature—the decreasing total heat of the steam and the increasing amount of that part of the heat convertible to mechanical energy in adiabatic expansion.

A number of tables, compiled by the author, are included to show what gains can be expected with increased pressures and varying conditions; of these, Tables II and III are a summary showing the theoretical percentage of gain for certain comparisons selected on account of their relation to conditions prevailing in present practice; in the case of atmospheric exhaust these gains are so large as to justify an endeavour to use high steam pressures.

TABLE II.—RELATIVE GAIN IN THERMAL EFFICIENCY DUE TO INCREASING STEAM PRESSURE TO 600 LB. PER SQ. IN. ABS.

Final condition of steam	29-in. vacuum.		Atmospheric exhaust.	
	Constant temp. ature, 600 F.	Constant superheat, 100 F.	Constant temper- ature, 100 F.	Constant superheat, 100 F.
As against 100 lb. initial pressure...	25 %	30 %	52 %	85 %
As against 200 lb. initial pressure...	13 %	15½ %	32 %	37½ %

TABLE III.—RELATIVE GAIN IN THERMAL EFFICIENCY DUE TO INCREASING STEAM PRESSURE TO 1,574 LB. ABS.

Final condition of steam	29-in. vacuum.		Atmospheric exhaust.	
	As against 100 lb. initial pressure,		As against 200 lb. initial pressure,	
100° superheat	44½ %	...	187 %
218° superheat	22½ %	...	105 %

The ideal Rankine cycle cannot be realised in practice. In steam turbines, steam expansion cannot be effected without friction losses, which are converted into heat, and so that extent make the expansion deviate from the adiabatic. It is also impossible to extract fully the mechanical energy manifested in steam velocity, the residual velocity representing a loss.

In piston engines of the double-flow type there are large losses due to initial condensation and heat transfer; in the uniflow piston engine such losses can be almost avoided by suitable design, but it is impossible to carry the expansion down to condenser pressure, because the compression, commencing at the point of the stroke where expansion ends, would be a reversal of the expansion, and no work would be done in the cylinder.

These sources of loss—friction in the turbine, condensation in the double-flow piston engine, and incomplete expansion in the uniflow engine—determine the practical limits of possibility of realising the Rankine cycle. In large steam turbines, the Rankine cycle efficiency has been carried to about 76 per cent., and a very similar efficiency has been realised in uniflow engines, even in small sizes. In the steam turbine, higher steam pressures will mean either higher velocities or more stages, both introducing higher friction losses, although it is to be expected that by careful design the percentage of these friction losses as compared with the total amount of energy available in adiabatic expansion can be kept the same as in present practice.

Present Boiler Design and High Pressure.—The foregoing seems to justify the employment of higher steam pressures. Standard boiler designs, however, do not permit the production of steam at a pressure higher than about 200 lb. without sacrificing safety and without calling for an investment in the boiler plant high enough to offset the gain in economy caused by higher steam pressures.

The solution of the problem of boiler safety under high steam pressures demands two fundamental changes in boiler design.

The boiler must be constructed entirely of tubes of relatively small diameter. All drums and vessels of large diameter, as well as all flat surfaces (even if stayed), must be abandoned.

Expanded beaded or riveted joints exposed to the action of the fire must be avoided. That part of the boiler which receives the heat of the furnace must be practically a one-piece structure.

It is important that in meeting these requirements the essential characteristic of water circulation in the boiler be retained to make possible a control of the steam pressure and of the water content of the boiler by simple means. Flash boilers, while permitting high steam pressures, are not desirable, because they require complicated automatic regulating devices, necessary on account of the interdependence of feed and fire control.

In considering boilers for high steam pressures, it must not be overlooked that the water in the boiler is at a higher temperature than that in a low-pressure boiler. This difference amounts to approximately 100 deg. for 600 lb. pressure, as compared with 200 lb. Even if the heating surface is made large, or, in other words, the evaporation per square foot is kept low, the stack gases will leave the high-pressure boiler at a temperature 100 deg. higher than the corresponding gases of the low-pressure boiler. The boiler efficiency, other things being equal, is correspondingly reduced.

It is possible to meet this difficulty by making the heating surface of high-pressure boilers larger in proportion to what is practised in boilers working under pressures used to-day. It is also possible to increase the effectiveness of the heating

surface by proper design. Boiler designers are realising the possibilities in this direction, even with steam pressures not higher than 200 lb. This is demonstrated by modern boilers which show an evaporation per square foot of heating surface twice as high as was customary only a few years ago, at the same time realising a better efficiency than formerly.

The possibilities of extraneous heat-saving devices should not be overlooked. Even though the waste gases leaving the boiler have a temperature of 700 deg. or more, a properly installed economiser will reduce this temperature to any desired degree within the limits given by the temperature of the feed water.

The question of strength of constructional parts outside of the boiler to withstand high steam pressures is of importance. In reciprocating engines this question can be answered from practice, because pressures far exceeding 600 lb. per sq. in. are used successfully in gas engines and Diesel engines, and therefore the design of cylinders for high steam pressures should not present difficulties not already overcome.

Extra-heavy High-pressure Casings for Turbines.—In steam turbines, especially in those of larger size, the casings of large diameter would need to have disproportionately heavy walls were they required to withstand pressures much higher than those now employed. The solution of the problem of adapting turbines to high pressures is found in the principle underlying most present designs of large steam-turbine units. According to this principle, the pressure of the steam is greatly reduced in the first nozzle and the resulting high velocity is utilised in several rows of blades of the velocity-stage type. Thus it is possible to confine high pressures to the steam piping and to the "steam belt" carrying the steam to the first nozzles, but to have comparatively low pressure even in the first part of the casing. The lesser efficiency of the velocity staging is not so serious at the high-pressure end as it would be at the low-pressure end, because the loss manifests itself in a somewhat higher superheat of the steam entering the succeeding stages and is partly recovered.

With high pressures the difficulties with piping and fittings are reduced on account of the lower specific volume of the steam. Even if lower rates of flow than those at present customary are permitted in high-pressure steam lines (on account of the greater density of the steam), the fact that 1 lb. of steam at 600 lb. pressure occupies approximately one-third of the space required by 1 lb. at 200 lb., reduces the required size of the piping and fittings to such an extent that difficulties in both design and cost for a given capacity are, if anything, less than for lower pressures.

Single-acting Steam Engine.—In piston engines the question of cylinder lubrication is important. It is apparent that high steam pressures will permit neither slide nor Corliss valves. The advent of higher pressure will cause the poppet valve to come into its own.

Most of the lubricating oil now used in piston engines is required for the steam-distributing valves.

For a given output the cost of a uniflow engine suitable for high steam pressures should be less than that of double-flow engines, as soon as it can be manufactured under economical conditions of manufacture. Such an engine, if single-acting, has but one simple organ of steam distribution, and on account of its high mean effective pressure its weight per horsepower is low. Even in a single-acting engine of this type the mechanism is utilised twice as efficiently as in a 4-stroke cycle Diesel engine.

Steam turbines for high steam pressures would probably cost a little more than those using lower pressures and giving the same power, on account of the extra stages required. The extra cost would be offset by a considerable saving in the required condenser cooling surface on account of the larger percentage of moisture in the steam entering the condenser and the reduced steam consumption due to better thermal efficiency. Table IV will make this clear.

TABLE IV.—REDUCED STEAM CONSUMPTION DUE TO BETTER THERMAL EFFICIENCY.

	270 lb.		600 lb.	
	600 F.		600 F.	
Ideal efficiency with 29-in. vacuum	0.329	0.378	0.329	0.378
Percentage of steam in exhaust	0.814	0.749	0.814	0.749
Ratio of condenser cooling surface = $0.329 \div 0.749 \div 0.378 = 0.812$	0.812. Thus, a saving of about 19 per cent. of the condenser cooling surface might be expected.			

The question of stuffing-boxes can be eliminated in both turbines and piston engines, in turbines because high steam pressures need not be carried beyond the first nozzle, and in piston engines because the single-acting type of engine is from many points of view the logical design for high pressures. In such a piston engine the steam of the one valve can be provided with a "haymuth" packing.

Auxiliaries.—In very large plants all auxiliaries are often driven by electric power, and the current is furnished by a separate unit. As these "house-service units" in modern power plants have capacities of 2,000 kw. and over, it is simple to operate them directly with high-pressure steam.

Where it is desired that the auxiliaries be driven independently, it should be possible to drive them with high-pressure steam turbines if the size of the auxiliary unit warrants this, or by high-pressure uniflow engines for the smaller sizes. In the latter case the lubrication could possibly be accomplished

with graphite only, so that the amount of lubricant introduced into the condenser would be insignificant and harmless.

Another way would be the non-condensing operation of the uniflow engines, using the heat of their exhaust in a feed-water heater. This manner of operation appears to be attractive, because the economy of noncondensing uniflow engines, as compared with noncondensing engines of other types, is high.

It seems clear that if steam pressures are increased to, say, 600 lb. per sq. in. without using temperatures higher than those employed in modern practice, the difficulties encountered by the designer are not formidable and are more easily met than in the case of some types of explosion engines which have been successfully designed. The result to be attained by adopting such high steam pressures appears to be fully worth the effort, because thermal efficiencies closely approaching those of explosion engines can be realised with simpler and less expensive apparatus and consequently better overall economy, at the same time retaining all the practical advantages which steam utilisation has over any other method of producing power.

CORRESPONDENCE.

Letters received by us after 5 P.M. on TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address on our possession.

The Limitation of Output.

From all the discussions upon the new trade campaign, which is being so insistently urged at this time, one feature emerges each and every time. So much stress has been laid upon the necessity of the trade unions abiding the supposed limitation of output, that one is constrained to look at this point in detail, so as to establish the fact beyond cavil, or to show that it may be merely a glit statement which is being produced as a dummy on the stage of argument. It is surely insufficient to lay to the charge of the trade unions that they are deliberately guilty of keeping down the output of their members in the workshops, or that they have done so in the past. After all, there are trade unions in enemy countries, and if there is limitation of output here, one may inquire whether enemy trade unions are faultless. Perhaps the docile Hun would blush to turn out anything less than his full working capacity. Maybe he has more encouragement to do his full share than his British counterpart. Few will dispute that much suspicion and mutual distrust exists between masters and men in this country. One of the causes of this is the feeling that employers never lose an opportunity of lowering prices. The usual piecework or bonus system of payment is too often unfair to one party or the other. Again, there may be in the same shop piecework on one job, and day work on another. For instance, in a locomotive boiler shop the billets are made on piecework, but it is not possible to fix piece rates for the men who test the finished boilers, because of the great variation in results. One boiler will only take hours to test, where another occupies days. One set of men are drawing bonus regularly, while others maintain only the bare weekly rate. In other cases a piece-rate is easily fixed, but is often whittled away by the employer until only the best worker makes any extra money, and he not much. On ordinary day work the best man draws the same reward as the inferior or more careless worker. It is common knowledge in factories where only semi-skilled workers are employed that the piecework rates are such as to afford the man or woman only a bare existence. Especially so is this the case where girls and women are concerned. The worker has no voice in the matter, except to take it or leave it, and the rates are usually left to the mercies of the time-fixer or some zealous reformer with an eye on the wage packets.

In the high-speed tool trade the worker has seen night men do their "whack," which is the equivalent of the slowest day worker, and still have plenty of time to spare. The rate paid was the usual trade rate per hour, and the quantity of work was the same for the same money. The trade unions are blamed for such a possibility, but no mention is made of the precise cause to be adapted for alterations. The trade rate paid in a district is supposed to be the minimum; in how many cases is it also the maximum, and why should it be so? Output will never be increased while the poor or slow worker's minimum is also the good worker's maximum. The employer is asking for more work in the same time. The worker demands more money. Already since the war began certain semi-skilled and unskilled workers, many thousands in number, have been granted a minimum wage for all over 19 years, plus a war bonus. New demands are now in arbitration varying from 4s. to 6s. per week for the same people. Whether the wages already in vogue are adequate or not is not a matter for present discussion. The facts are simply mentioned to show the present trend. Both employer and worker are out to make the best of the present situation; the one to demand more work as an aid to beat the German, the other to boost up his standard wage for the uncertain future. One can only hope that each may be satisfied. In passing, however, it may be pointed out that the prices of our rivals' goods, if and when they do once more appear in the markets of the world,

will have some influence upon the wages of the British worker, and this should not be forgotten. It would seem better to give a fair wage and see that it is earned, than either to treat all alike on a dead level, or to swindle the worker by offering an illusory, and ever-changing, bonus system, under which only the pick of the workers can make extra money.

Restriction of output may be the child of bad times. It is feasible that a man may pardonably not rush his work when he hardly knows whence the next job will come. This has often of old been the case in British factories. No system of protection can guarantee a full order book, but, at the same time, we have too often seen German and other foreign goods on our markets when our own workers have been idle. Restriction of output may, then, even be good: the output of enemy works which flows into our Empire's markets and our home ports. British mechanics will make more money constructing a complete machine than in assembling one made in America. The C.M.A. will have more dividends if they make both the tubing and the cable, instead of making the conduit at home alone, and allowing German cable to be drawn into it. The Minister of Munitions, likewise, will not long complain of his own countrymen "going slow" when once he and his brethren take the plunge and restrict once for all the output of the Central Empires.

Commercial.

Electrolytic Copper.

All engineers will be indebted to Mr. Thos. Bolton, who is an authority on this subject, for his contribution in your issue of December 24th towards finding a generally acceptable definition of hard-drawn copper of circular section, and I feel sure that his views will be fully considered before the Engineering Standards Committee completes its revision of the present standard, which was issued in March, 1910. I fully share his hope that the Director of the National Physical Laboratory will be able to carry out the suggested investigations before any final decision is taken by the E.S.C.

Mr. Bolton is a manufacturer, and approaches the consideration of this subject from a somewhat different point of view to myself. My Manchester address was prepared chiefly from the point of view of the user of hard-drawn copper wire, who has been looking in vain for many years for guidance from the E.S.C., the I.E.E., or the manufacturers, towards a satisfactory definition. Failing this, a considerable advance towards a complete definition has been suggested by Mr. D. B. Pye, and my experience is that an increasing number of engineers are using his formulae to ascertain what are the MINIMUM values of tensile strength and extension for any particular size of wire. Each formula provides a sort of datum line in each test, and the 4 per cent. given in the E.S.C. report provides a maximum extension limit while omitting all guidance about tensile strength.

One cannot help feeling that Mr. Bolton does not fully realise the convenience to the purchaser of hard-drawn wire, who is not an expert, of being able to obtain these MINIMUM values from Pye's formulae, and of thus having a check on the manufacturers, not only for all standard sizes of wires, but also for the many intermediate sizes which are constantly being used, and of being reasonably sure that, if these figures are attained, he will obtain wire which is free from brittleness.

I have referred to Mr. F. Johnson's contribution to the discussion on Mr. Pye's paper, and I am interested to find that, while he agrees with the view that the strength of wire does not lie in its skin, he also agrees with the practicability of Mr. Pye's formulae.

With regard to the proposed inclusion of the limit of proportionality in the definition, it is my opinion that this point on the load-extension curve is of more importance than the elastic limit, and for a fuller discussion of this matter, which is not an academic one, I would refer those who are interested to the leading article in the *Engineer* of October 8th, 1915. It is the limit of proportionality which is really of importance to the users of hard-drawn copper wire, as it is the point where the elastic extension ceases to be directly proportional to the load, and where no question of permanent set is involved. My basis figures for the values quoted were taken from the E.S.C. Report No. 55 for wires up to 0.194 in. diameter, and I was surprised to find how low some of them are. They are lower than the elastic limit values which are given by some makers, and which are, in my opinion, misleading, although not intentionally so. The position is unsatisfactory, and I think Mr. Bolton will agree that the uncertainties should be cleared up. The E.S.C. values were based on tests made with great care by the N.P.L., and we must accept these results unless we can show an error in the method or later improvements in the material, or in its method of manufacture. Further tests of the same authoritative kind by the N.P.L. are now needed on wires from No. 5 S.W.G. to 7/0 S.W.G., which have not been specially manufactured for the purpose of the tests.

Under ordinary works conditions, autographic records can be taken, when required, while samples are being tested for tensile strength, and from these the limit of proportionality can be determined with sufficient accuracy for most purposes.

We get on to controversial ground when we discuss wrap and torsion tests in preference to extension tests as a test of brittleness. There is a considerable weight of opinion against the former. The report of the Wire Committee of the Ameri-

can Society of Testing Materials may be quoted against them, and also the fact that American engineers have discarded them, and now use extension tests. With proper apparatus, an approximately accurate extension test need not be a lengthy one, and, further, it is not essential that every coil of wire should be tested nowadays, whatever may have been needed at the time the G.P.O. engineers first adopted their wrap and twist tests.

In conclusion, in adding my own thanks to Mr. Bolton, I would hazard the opinion that he has in mind already a definition of hard-drawn copper which would completely satisfy him. Perhaps, at this stage, it would not be desirable to discuss it in the technical Press, but if the I.E.E. would take the whole matter in hand, as I have suggested, there need be no great difficulty in getting a small committee, representing the I.E.E., the N.P.L., the manufacturers, and the users, to agree on a definition and then to send a joint recommendation to the E.S.C. A little extension of the work would also produce a standard specification.

B. Welbourn.

Rainhill, Lanes., January 4th, 1916.

WAR ITEMS.

After the War Trade.—In the House of Commons on Monday there was another discussion on after the war questions, and we think that it must be unhesitatingly described as the best of the three Parliamentary debates that have so far taken place on such matters. The discussion was opened by Mr. Hewins, who moved that, with a view to increasing the power of the Allies in the prosecution of the war, His Majesty's Government should enter into immediate consultation with the Governments of the Dominions, in order with their aid to bring the whole economic strength of the Empire into co-operation with our Allies in a policy directed against the enemy. Other speakers in the debate were Mr. Peto, Sir A. Mond, Mr. Shirley Bunn, Mr. Prothero, Mr. Chaplin, Mr. Mackinder, Sir G. Croydon Marks, Mr. Bryce, and, finally, Mr. Runciman. In the course of the speeches reference was made to the commercial position after the war, the economic resources of the British Empire, German organisation and system, the possibility of the rapid restoration of German scientific competition, the prospect of the United States becoming a dangerous competitor, and very many other points that have been covered in articles that have appeared in our own and other journals during the last eighteen months. Mr. Runciman's reply showed that he regarded the discussion as an important one. Had he regarded it as a merely academic one he would have asked leave of the House to be attending to practical business elsewhere. Any decision which the House or Government came to with regard to trade matters at the present time had a direct bearing either on the strength of this country or on the strength of the enemy. He believed that Germany was at last beginning to feel the effects of the blockade. So far as treaties with Austria and Germany were concerned they were non-existent, having come to an end with the outbreak of war. History could not go on after the war, from exactly the same point. In regard to tariff arrangements between Germany and Russia, the latter would be more likely than in the past to listen in the most friendly spirit to the representations that we might make in regard to future arrangements. How far she would be prepared to go no one could say. No Russian statesman could yet say exactly the lines on which her economic development was likely to proceed. He was confident, however, that she was not going to make herself the tool of Germany. "Peaceful penetration" would not be allowed to continue in Russia. We should be able to make up our vast losses in a shorter period of time than any other State, and it would be our duty, so far as we could, to aid Italy, France, and Russia in the same process. Mr. Runciman proceeded to justify the efforts made to capture German trade. Many of our firms had built up, during the war, strong connections in South America which he hoped would last long after the war. They had studied their customers' tastes with greater ingenuity than ever in times of peace, and they had made almost unprecedented efforts in commercial travelling. The President went on to refer to efforts made by our manufacturers to take up industries once in German hands—glass, chemicals, dyes, electrical apparatus, etc. It was more than a mere matter of competition with Germany. It ought to be part of our national organisation to see that there was no essential article, either for the arts of peace or for the arts of war, which could not be obtained within the Empire. Government assistance might do a great deal, but not without the personal ability, training, skill and industry of the individual. He laid it down as one of the first necessities of this country that if she was to hold her own during times of war, and when war was over, we must improve our research methods, the education of our people, and the training of our young men. We should not attempt to economise on the money that we now spent on technical colleges and modern appliances. If our present well-managed banking systems could not be

more adventurous we must have some additional institutions. Commercial banking must play a large part if we were to hold our own against Germany. We must once more overhaul our patent system. The development of new inventions, and the restrictions which we put on their use, may have a greater influence on the extension of our trade and industry than even the juggling of a tariff. The importance of co-operation with the Dominions, the spirit of the Dominions, and the question of foreign shipping competition, were among the other matters referred to by Mr. Runciman in the course of a long speech which is well worth reading from beginning to end by all of our readers who are keenly studying the problems of the present hour. Now, repeated the speaker, Germany was a commercially beaten nation if there ever was such. But the real trouble was, when the war was at an end, she might wish to embark upon a new campaign. In this connection it would be necessary for us in making peace to see to it that she did not raise her head.

Russian Trade.—Speaking on the Russian electrical trade opening, at a meeting of the French Syndicat des Industries Electriques held at the end of last year, M. de Halgout, commercial attaché at the French Embassy at Petrograd, stated that before the war the Russian electrical industry had become a veritable German monopoly. Three great companies, German in origin, divided the business between themselves. These were the Volta Company, of little importance; the A.E.G., operating at Riga; and the Siemens-Schuckert companies, which were formerly distinct, but were now amalgamated. Owing to this important trust, the Germans had succeeded in securing all the orders. The *modus operandi* of these houses was as follows:—First, they granted long terms of payment; then they had agents, who waited on the Russian manufacturers, studied their wants, and submitted estimates for the carrying out of installations complete to the smallest detail. Furthermore, the Germans had a wonderful acquaintance with the Customs tariffs. In Russian workshops which they opened, they made all those parts which it would cost too much to import; thanks to these measures, it might be said that, in 1913, the Germans monopolised three-fourths of the Russian electrical trade. Of the three German houses, the two principal—the Siemens-Schuckert and the A.E.G.—were constituted with capitals of 15 and 12 million roubles respectively; together they did, in the year 1913, business to the extent of 130 million of francs, of which 40 million only represented goods made locally, and 90 millions were imports by these German houses working under a Russian label. These houses are still operating; moreover, if they were stopped, the whole Russian electrical industry would be stopped too, and as this industry is indispensable for the National Defence, it is impossible to do so. One could, on the other hand, call for the liquidation of these companies if a French group could subscribe the necessary capital, and replace by French importations the German importations made by these companies. To do so, a capital of 50 million roubles would have to be got together, and a similar machine-tool equipment and skilled staff as that possessed by the Germans would have to be forwarded to Russia. . . . If however, the liquidation of the A.E.G. only were called for, a capital of only 10 million roubles would be required.

In subsequent observations relating to the fostering of French exports to Russia he advocated, as a preventative against bad debts, representation on the boards of Russian electrical concerns, and reaffirmed his statements that the best methods of developing exports towards Russia was to establish on the spot technical bureaux identical with those possessed by the Germans. Russians preferred comprehensive and complete estimates, and, only after their study, were orders placed. The technical bureaux mentioned should have branches, and the most competent agents, in every industrial district. An electrical section might also be attached to the Sales Office which the French Foreign Trade Bureau was about to open, while the Syndicat's affiliation to the French Chamber of Commerce in Petrograd was also advisable in this connection.

To Platinum Dealers.—The Director of Materials at the Ministry of Munitions has addressed the following notice to dealers in platinum:—

I am directed by the Minister of Munitions to inform you that, in exercise of the powers conferred on him by the Articles of Commerce (Returns, &c.) Act, 1914, pursuant to arrangements made with the Board of Trade, he hereby requires you within three days from the date of this notice to make a return to the Director of Materials of the Ministry of Munitions, Armament Building, Whitehall Place, S.W., of the whole of the stock of platinum, ores, residues, or bars containing the same, now on your premises or under your control.

I am at the same time to draw your attention to Defence of the Realm Regulation 134, and to the Order made by the Minister of Munitions thereunder, and I am to charge you that any person buying, selling, or dealing in platinum, or goods manufactured wholly or partly of platinum, offering or inviting on offer or proposing to buy, sell, or deal in it or them, or entering into a contract for the sale or purchase of or other dealing in it or them, without a permit, is liable to the penalties provided for offences against the Defence of the Realm Regulations.

Birmingham Electrical Volunteers.—We read in the "Birmingham Daily Dispatch" that the first batch of men raised by Mr. W. E. Milns, adjutant of the Birmingham Electrical Volunteers, for engineering work in connection with coast defence, left Birmingham on January 10th. The local corps have been asked by the Admiralty to supply and maintain a section of skilled engineers who are ineligible

for military service. Mechanical and electrical workmen of all grades, and also clerks with a knowledge of the engineering trades who are willing to give a week or more to this work, are asked to communicate by letter with Mr. Milns at 14, Dale End, Birmingham. A meeting of all interested in the scheme will be held at the Birmingham Arms, Jamaica Row, at 7.30 p.m. to-day, Friday, at which Mr. Milns will explain the scheme in detail. Those who volunteer will have their train fare paid, billets will be provided, and a small daily allowance will be made.

St. Helens and Enemy Contracts.—A somewhat lengthy discussion took place at a meeting of the St. Helens T.C. on January 5th respecting a proposal to accept the tender of a certain firm for the supply of a water cooling tower. The point of discussion was as to whether or no the firm with whom it was proposed to place the contract was a British firm with British capital, and Ald. Sir John Beecham (chairman of the Electricity Committee) said that inquiries had been made and the committee was satisfied. Some members of the Council appeared doubtful, and Sir John Beecham ultimately accepted a suggestion that the Mayor, the Chairman, and the Town Clerk should find out definitely what the position was. Following the discussion the Mayor (Ald. Bates) moved: "That no contract shall be entered into with any person, firm or company, of enemy nationality." This was seconded by Sir John Beecham, and carried.

The Trade War.—It is announced that, at the request of a large number of business men, the Lord Mayor has convened a meeting for Monday, January 31st, at 3 p.m., to consider the questions of trading and employment after the war. Many organisations will be represented.

The Italian Chamber of Commerce in London has passed resolutions expressing the opinion that it is desirable:—(1) That the Allied Governments should arrive at an agreement to institute a reciprocal preferential tariff, and in that case all goods imported from countries which are not parties to the agreement should plainly indicate their origin. (2) That the shipping and railway services between the Allied countries should be improved and extended, the shipping lines subsidised and granted special facilities, including reduced port and dock fees. (3) That the principal commercial laws of the Allied countries should be made uniform to correspond with the needs of international trade; and (4) that for all supplies for, and contracts with, the Allied Governments and public bodies only the Allied countries should be allowed to tender.—"Morning Post."

London Lighting.—Replying to a question in the House of Commons on January 6th, Mr. Hayes Fisher said the President of the Board of Trade was strongly in favour of any economy that could be effected in the electric lighting of London, and he understood that in a very large proportion of the public lamps the candle-power had already been reduced; but in some cases the type of lamp employed was such that to reduce the candle-power would involve a considerable amount of initial expenditure which would be thrown away in so far as it was not recouped by savings before the end of the war. He was informed that the employment of lamps of low candle-power not blacked over would not fulfil the main object of the regulations.—"Times."

Enemy Capital.—In the House of Commons last week a member asked the President of the Board of Trade whether he would publish the list of firms trading in this country influenced by German capital, of which the Public Trustee had official cognisance as supervisor or in any other official capacity, in order that the public might be made aware of the character of the firms with whom they dealt. Mr. Runciman replied: "As at present advised, I do not propose to publish a list of firms with German capital, but legislation will shortly be introduced to confer further powers upon the Board of Trade to take steps in suitable cases to prevent the continuance of businesses carried on for the benefit of enemies."

Petrograd Electro-technical Institution and the War.—The Council of the Professors of the Petrograd Electro-technical Institution has made its lectures free to 121 of the students. On account of the consequent reduction in the receipts, the firm of Erikson has made a gift of 1,000 roubles. On the question of commemorating the death of those connected with the Institution who had fallen in war, it was decided to decorate the lecture hall with black and white marble slabs. On the black slab will be inscribed the names of all those students who have fallen in the war, and on the white slab the names of those who have distinguished themselves in battle.

Australian Councils and British Preference.—A Melbourne paper says that in his report to Hawthorn Council in November, as delegate on the Prahran-Malvern Trust, the Mayor (Councillor Russell) stated that in accepting tenders for overhead equipment for the Burke Road and White Horse Road tramways the Trust had given preference to a British tender as against an American one. Councillor Russell added that, as far as he was concerned, he would carry out this policy in every case. He trusted that after the war was over municipalities and public bodies would continue the practice of always giving preference to British goods over American.

A New Canteen.—At a certain very progressive and well-known electrical instrument factory not very far from London, where a variety of instruments for the Government are being made, the Y.M.C.A. has organised a canteen for the convenience of the workers, on lines similar to those followed at Woolwich and other industrial centres, but, of course, on a smaller scale. Mrs. Winston Churchill, who is actively engaged in this branch of Y.M.C.A. work, enlisted the sympathetic assistance of a staff of local ladies, and she opened the new building with an address to this voluntary staff of about thirty ladies. The proprietor of the works expressed the gratitude of the working staff for the assistance rendered, which made it possible to provide the good food which was necessary to enable good work to be done. He briefly demonstrated a few of the instruments which were being made at the works. He also said that much of the work was already being done by young women, and that there was scope for many more in such work, even after the war.

Recruiting Notes.—It was reported to the Tunbridge Wells T.C. that the whole of the eligible staff at the electricity works had applied to be attested under Lord Derby's scheme. Five had been rejected and nine accepted. The Council has decided to apply to the tribunal for the retention of the nine men as being indispensable for the maintenance of the undertaking.

The number of men connected with the electrical department of the Great Western Railway who are now serving with the Colours, is 71, this being 25 per cent. of the staff. From the same department no less than 125 have presented themselves for attestation under Lord Derby's scheme.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Horn-Gap Fuses.

Reading the note on horn-gap fuses which appeared in our last issue, the ELECTRIC AND GENERAL WORKS, LTD., of 15, Victoria Street, London, S.W., noticed the resemblance of the apparatus to one which they supply, and which has been on the market for a number of years. The accompanying figure shows one of their triple-pole horn-gap fuses for mounting on a transmission-line pole in the open; it will be noted that the horns are precisely of the form advocated, and, in fact, the company's works, which claim very special experience extending over many years in all types of horn-gap switchgear, have been making all their horns in this form for some time past.

In the example illustrated herewith, the horns consist of $\frac{1}{16}$ in. copper wire and are very easily renewable. The fuse-strip con-

FIG. 1.—TRIPLE-POLE HORN-GAP FUSE.

sists of pure silver wire, which the makers find gives by far the best results, as it is to a great degree unaffected by climatic conditions, and the fusing point remains much more constant than in the case of copper. It also blows far more quietly. A great advantage of the design consists in the fact that the fuse-strip is not attached to the horns themselves, but is supported in substantial terminals immediately below the gap. In this way the wear and tear of the metal forming the horns at either side of the gap is reduced to a minimum, the life of the horns being thus greatly lengthened, so that renewal, or any attention at all to the horns, is rarely necessary. The replacing of the fuse-strip, which is not enclosed in any way, is also greatly simplified. These horn-gap fuses are supplied for pressures ranging from 4,000 to 35,000 volts, and for currents up to 200 amperes.

New Insulated Lampholder.

We have received from MESSRS. ST. JOHN DAY (PATENTS), LTD., of Mumps Electrical Works, Oldham, particulars of a new insulated lampholder of extremely simple design, constructed throughout of Oldamit insulating material, with the exception of the contact making plungers and wiring terminals, which latter are wired on the firm's "one part" principle.

The holder consists of three main parts, viz., the body in which are inserted the two one-piece contact plungers and wiring terminals, with an insulating partition between the latter; a nipple

FIG. 2.—INSULATED LAMPHOLDER, WITH COMBINED SHADE RING AND LAMP SUPPORT.

which screws into the upper end of the holder, and through the centre of which the flexible passes; and a "combined shade ring and lamp support," which is screwed on to the lower part of the body, and a shade being slipped over the body first, takes the place of the ordinary shade ring. At the same time the lower portion of this ring is provided with internal grooves to form the lamp socket, the grooves being in the correct relative position to the plungers, when the ring is screwed up.

Independent adjustment of the shade fixing can be obtained by a separate ring screwed on the outside of the combined shade ring and lamp support, and an insulating hood, or petticoat, can also be provided, if desired.

FIG. 3.—LAMP SUPPORT IN POSITION.

By slightly turning the combined shade and lamp support in a left-hand direction, and thus disconnecting the lamp contacts, the device can be used as a switch-holder, and a limit stop is supplied, if desired, for this purpose.

An improved design of the same kind is being made in which the switch break takes place in the body with an insulating wall between each pole. The holders are made in various qualities of material to withstand heat, gases, acids and rough usage, and are covered by several patents.

LEGAL.

POWER SUPPLY USED FOR LIGHTING.

At the Halifax Police Court, on January 7th, J. W. Scott, motor engineer, pleaded guilty to a charge of having fraudulently consumed electricity at his premises, and was fined £5, including costs. Electricity supplied at 2d. per unit for power purposes had been used for lighting, whereas the lighting rate was 1d. It was stated that defendant had offended unwittingly, the wiring having been done by a former employer, who should have known that it was improper. Defendant had now offered to pay the Corporation at lighting rates for all the electricity he had used during the past year.

SENDING ELECTRIC BATTERIES TO AMSTERDAM.

IN the City of London Court, on January 7th, before Sir John Paget, Bart., K.C., Deputy Judge, Van Oppen & Co., Ltd., carriers, 90 and 91, Bartholomew Close, E.C., claimed £5,124, 11d. against Mr. A. Francis, 79, Shaftesbury Street, New North Road, electrician, for shipping charges in taking 4,000 electric batteries from London to Amsterdam. Mr. Gibson appeared for the plaintiffs, and Mr. Gowling for the defendant.

Mr. HUBBARD, plaintiffs' dispatch clerk, said that they carried the goods under a consignment note. They were refused by the consignees in Amsterdam, and had to be brought back. That involved the payment of duty in Amsterdam, Customs charges, &c.

Defendant told the Court that he bought 5,200 batteries in Amsterdam. Only 1,200 were good ones, and the rest were bad. Consequently he engaged the plaintiffs to take back the 4,000 bad batteries and collect good ones in their place. Plaintiffs did not do that. Therefore they were entitled to nothing. It was ridiculous to suggest that duty was payable in Amsterdam on goods which were manufactured in Holland.

The DEPUTY JUDGE thought the defendant's suggestion a very unreasonable one, seeing that the plaintiffs would not get paid anything if they could not get the good batteries in exchange. Mr. Gibson: And the firm in Amsterdam have gone bankrupt. That is why we could not get the good ones. Defendant said that was not so. In cross-examination he said that he did not sign the consignment note. It was signed by a German who had since been interned. Many firms took out goods to Holland to exchange them, and were paid nothing unless they brought back the goods. The Deputy Judge did not think the plaintiffs would enter into such a silly contract as was suggested by the defendant. It was very improvable.

Mr. GIBSON: No firm of carriers would be able to carry on business if the defendant's view were to prevail.

The DEPUTY JUDGE found for the plaintiffs, with costs. Mr. Gowling asked for leave to appeal. Plaintiffs had been guilty of a breach of duty, and it would mean a serious loss to the defendant. The Deputy Judge refused leave, and said that the consignment note was dead against the defendant.

URBAN ELECTRIC SUPPLY CO.'S APPEAL.

THE Lands Valuation Appeal Court (Lords Salvesen, Mackenzie, and Cullen), sitting in Edinburgh, disposed of an appeal by the Urban Electric Supply Co., Ltd., who appealed against the valuation of their electric works and mains in the burgh of Hawick. The works at 20, Commercial Road, Hawick, were entered in the roll at £1,210, and the mains in the burgh at £1,210, and the appellants claimed that the valuations should be reduced to £590 each. It was stated that the parties were agreed that the "profits principle" should be the basis for calculating the assessed rent. The Burgh Valuation Committee reduced the valuation by £121 to £2,300 for works and mains.

The Court affirmed the determination of the Valuation Committee except to the extent of £25, which was allowed as a further deduction from the valuation.

LORD SALVESEN said the most important question was as to whether certain machinery, which was *de facto* in its nature heritable, and was used for the purpose of supplying motive power, must, nevertheless, be included in the tenants' capital, so as to reduce the assessable value of the buildings belonging to the company. His Lordship was clearly of opinion that that claim was excluded by the Valuation Act. The machinery consisted principally of superheaters and mechanical stokers, and was used for the purpose of producing or transmitting first power, and although these might affect a certain saving in the labour bill, they could not be regarded otherwise than as heritable. Another question was whether the tenant was entitled to include in tenants' capital a sum of £500, which he kept in the bank to meet current expenses, and which earned no interest. The tenant required that sum to carry on his business, and accordingly was entitled to a deduction of £25, being at the rate of 5 per cent. A third point dealt with the claim of the appellants that four months' extra stock of coal should be treated as part of the necessary capital of the tenant. His Lordship was of opinion upon the facts that that extra stock was not necessary. The Assessor had already allowed for five months' working expenses, which included the cost of coal for five months, and the appellants' claim that nine months' supply was a minimum had not been proved.

Lords Mackenzie and Cullen concurred.

ELECTRICAL ENGINEER'S CLAIM.

IN the Court of Session, Edinburgh, a settlement has been effected in the action pending before Lord Anderson, in which James Kyle, electrical engineer, 3, Crichton Place, Edinburgh, sued John M. Roger, Balgrove Farm, St. Andrews, for payment of £700 as damages in respect of personal injuries. The pursuer was serving as a dispatch-rider in the Lothians and Border Horse, and was stationed at Ceres. On September 14th, 1914, he was riding a motor-cycle towards St. Andrews, when, near the village of Dairsie, he was run into by a motor-car belonging to, and driven by, the defender, coming in the opposite direction. He was severely injured. The defender denied fault, and alleged several faults against the pursuer in driving his cycle. The case has now been settled by a payment to the pursuer of £100 and expenses, and the action has been taken out of Court by joint minute.

WORKMEN'S COMPENSATION CLAIM.

IN the City of London Court, on January 10th, before his Honour Judge Atherley-Jones, K.C., a claim was made by a labourer, named George F. Ling, against Messrs. Babcock & Wilcox, Ltd., water-tube boiler makers, to recover damages under the Workmen's Compensation Act for injuries received while working for them. Mr. Rowe appeared for the plaintiff and Mr. Harold Morris for the defendants.

Mr. ROWE said that the plaintiff sustained severe injuries in July. He was employed by the defendants at the London and South-Western Railway Co.'s generating station at Wimbledon. They were putting in boiler tubes, and the method of lifting them was to use a piece of wood. The wood slipped in one instance, and the tube fell, cutting off a piece of the plaintiff's left ear, and bruising his head and face. He was taken to the hospital, where he remained a fortnight. During his illness he was paid 15s. a week half-wages and now he was paid full wages. Plaintiff was fit to work and might be discharged. Then plaintiff would have no remedy under the Act unless the Court made an order.

Mr. MORRIS urged that no dispute had arisen; therefore the Court had no jurisdiction. Plaintiff was only entitled to a declaration of liability, and that had never been asked for. He was still getting his full wages.

The JUDGE said that the plaintiff would have a declaration of liability and costs. If he got worse he could come back.

THERMIT WELDING.

AN application was made before the Patents Court on January 5th, by the British Thermit Co., of the Albany, Liverpool, for a licence to use eight patents owned by Thermit, Ltd., of London, alleged to be necessary for carrying out the Thermit process of welding the joints of rails.

Mr. E. R. Royston, patents agent, of Liverpool, appeared for the applicants, and Mr. Colefax, K.C., and Mr. Hunter Gray for the opponents.

Mr. ROYSTON said that Thermit, Ltd., was a company registered in England, but with German shareholders. It was now a controlled establishment with a supervisor appointed by the Government. He urged that an alien company could not be allowed to remain in possession of the patents, and contended that in view of the advantageous position of the opponent company, any royalty should be very small.

Mr. COLEFAX, in addressing the Court in opposition to the application, referred to the rules laid down in the Act of 1914.

The CONTROLLER said it would take a good deal to convince him that it was not in the interest of the community that an independent, purely English company, in which the profits went to English shareholders, should be set up. The object of the whole of this legislation was that English trade might be fostered.

Mr. TURNER, the managing director of the British Thermit Co., Ltd., giving evidence, said that it was practically impossible to go on any further in view of the patents held by the competing company. If the applicants had a licence to use these patents, they would be able to weld tramway rails for corporations themselves. At present they could only sell Thermit, and corporations did not give them orders because they could not weld the joints, owing to the patents held by the opponent company.

Mr. COLEFAX submitted that the needs of the country were satisfied by Thermit, Ltd., that there was no ground for apprehending that there would be a scarcity of the material, and that the applicants were entirely incapable of doing the work.

In the case of a licence being granted, he suggested a royalty of 2½ per cent. as against 6d. suggested by Mr. Royston.

The Court reserved its decision.

BUSINESS NOTES.

Norwegian Nitrogen.—The report for 1914-15 of the Norwegian Nitrogen Co., which is a Franco-Norwegian undertaking, states that the increase in the turnover kept pace with the development of the production; the profits correspondingly experienced an expansion, and the further progress of the company is regarded with optimism. The net profits, which amounted to £275,000 in 1913-14, rose to £399,000 in the past year, and the dividend proposed on the ordinary share capital of £3,188,000 is at the rate of 7 per cent. as compared with 6 per cent. in 1913-14, the preference shareholders receiving 5 per cent.

Patent Restoration.—An order has been made restoring Letters Patent No. 16,237 of 1910, granted to Henry Norman Leask for "Improvements in charging doors for furnaces."

New Industries in the U.S.A.—According to a Reuter telegram, a company has been formed in the United States to manufacture nitric acid by extracting nitrogen from the air, with the aid of water-power in Canada, near Lake St. John and on the Saguenay River.

The manufacture of quartz glass from sand deposits found in the State of Nebraska has been developed on a large scale, owing to the cessation of importations from Germany.

Bankruptcy Proceedings.—AUGUSTINE GARRUTT, "electrical engineer, now weighing-machine attendant," Leeds.—First meeting January 14th; public examination, February 1st; both at Leeds.

Trade Announcements.—MR. A. G. INGLEBY, late of the machinery department of the Adnill Electric Co. has joined the ELECTRICAL SUPPLIES Co., of Tottenham Court Road, W. in order to take charge of their engineering department. This department has been reorganised. The company is now representing the following in London and the South of England:—The Keighley Electrical Engineering Co., Ltd., for A.C. motors and dynamos up to and including 125 H.P., and Messrs. Firth & Russell, of Leeds, for A.C. motors up to 100 H.P.

MESSRS. CAVE & HIGGIN, LTD., have removed into their new premises at 265, Deansgate, Manchester. (Telephone: Central 1283.)

MESSRS. A. J. GREENLY & THEODORE DENISON have taken over Baldwin & Wills works, St. Albans Road, Watford, and commenced business as manufacturing electrical and mechanical engineers, under the style of Greenly & Denison, with offices at 37 and 38, Strand, W.C. The firm are in a position to do small turning, boring, screw-cutting, and other work. The Greenly Advertising Service will be carried on by Mr. Greenly as heretofore.

THE CHLORIDE ELECTRICAL STORAGE Co., LTD., of Victoria Street, London, S.W., intimate that their telephone numbers are:—442 and 443 Victoria. Some of their friends continue to call up numbers that were discontinued some time ago.

Liquidations.—SOUTH WALES WIRELESS TRAINING COLLEGE, LTD.—This company is winding up voluntarily with a view to reconstruction. Mr. G. F. Willett, 92, Queen Street, Cardiff, is the liquidator, and a new company known as the South Wales and West of England Wireless Training College, Ltd., is to be formed.

EMPIRE PORTLAND CEMENT Co., LTD., Northfleet, Kent.—A meeting of the committee of creditors was held on January 5th, and adjourned until January 13th.

BRITISH METAL ENGRAVING Co., LTD.—A meeting is called for February 11th, at 3, Warwick Court, Gray's Inn, W.C., to hear an account of the winding up.

PARANA POWER SYNDICATE, LTD.—Creditors must send particulars of their debts, &c., to Mr. L. Maltby, 4, London Wall Buildings, E.C., the liquidator, by February 1st.

Catalogues and Calendars.—MESSRS. STEWARTS AND LLOYDS, LTD., of Winchester House, E.C., have again favoured us with one of their white and gold wall calendars, with the flags of the Allies artistically inset above the monthly date cards.

MESSRS. MATHER BROS., of 35 and 36, Farringdon Street, London, E.C., have issued a wall calendar with monthly sheets for 1916.

MESSRS. SIMPLEX CONDUITS, LTD., of Garrison Lane, Birmingham, have sent us one of the admirable pocket diaries which have become identified with their name—a pocket-book which in shape, size and make-up, is, perhaps, the most handy and useful that we know of. With it comes a novelty in the form of a "cable capacity gauge"—a set of hinged brass disks, perforated with holes exactly corresponding with the internal diameters of the eight sizes of Simplex heavy-gauge conduit. A set of cards is provided, showing the outlines of 12 sizes of insulated cable packed close together, and, by placing the gauge over the appropriate diagram, the maximum number of cables of a given size that the conduit will contain is at once ascertained. The gauge and cards are provided with a neat leather case for the pocket, and should prove extremely useful to contractors.

MESSRS. TURNER BROS., Rochdale.—Twenty-page publication showing reproductions of a series of advertisements, which have appeared in the Press, of their asbestos and other goods.

MESSRS. BERRY, SKINNER & Co., 78, Upper Thames Street, London, E.C., have prepared an embossed metal perpetual calendar, the metal work of which is made to a design around an archway through which is seen an illustration of one of the firm's "Ironsafe" switchboards.

THE STEEL TUBES AND CONDUITS Co., Alice Street Works, Keighley.—Twenty-four-page illustrated catalogue giving particulars and prices of their conduits and fittings for electrical purposes, including "Spring" inspection fittings, "Stacc" grip fittings, tees, couplings, bends, circular junction boxes, cast-iron universal boxes, and sundries.

RUGBY LAMP Co., LTD., Rugby.—Illustrated price list of "White Star" metal-filament and "Rugby" carbon-filament lamps.

MESSRS. FERRANTI, LTD., Central House, Kingsway, London, W.C.—List Hb. 145 gives a description and tabulated sizes, weights, capacity, prices, &c., of their type Wb electric water-heater.

MESSRS. C. J. EDWARDS & SON, LTD., of 32-34, Great Sutton Street, Clerkenwell, E.C., have prepared a large hanging calendar-sheet for 1916, with the dates for the year very clearly set out, also a list of engineering stores stocked by them.

Electric Horns.—THE BENJAMIN ELECTRIC, LTD., of 1A, Rosebery Avenue, London, E.C., have issued a circular embodying a special New Year's offer to the trade of Benjamin electric motor horns.

LIGHTING AND POWER NOTES.

Aberystwyth.—FIRE.—According to the *Times* a fire occurred on the switchboard at the electricity works on Monday, which it was expected would result in shutting down the electric supply for two days.

Argentina.—It is proposed to form a local co-operative electric light and power society in Mar del Plata, with a capital of \$500,000 m/a.

After allowing several extensions of time to the municipal authorities for payment of a debt of \$22,000 n/o. for electric lighting, the local electric light company of San Antonio de Areco cut off the current. The general public who pay their rates and taxes punctually are disgusted at the awkward situation the municipal maladministration has placed them in.—*Review of the River Plate*

Ashted.—STREET LIGHTING.—With regard to restricted lighting, the Leatherhead Electricity Co. has pointed out to the P.C. that the greater part of the cost of the street lighting was made up of interest and sinking fund charges on the mains and fittings, and that, although if the lamps were not used a certain amount of fuel was saved at the E.L. station, the fixed charges remained just the same. It was also pointed out that the present contract terminated next May, and the company had no assurance that it would be renewed, and it might be compelled to disconnect all the mains and fittings. The company offered to discuss a reduction in the charge for the present year when the lamps were not used for the full time, at the same time it discussed the question of the contract for the lighting for the next five years. The Council has decided to renew the request for a rebate.

Attleborough.—E.L. SCHEME.—The promoters of an E.L. scheme for this parish have applied to the Eastern Highways Committee of the Norfolk County Council for permission to erect poles for overhead wires, and sanction has been withheld pending a report from the county surveyor.

Australia.—The Mount Gambier (S.A.) Corporation agreement with Messrs. Bridger, Ltd., for the supply of electricity to the town is for a term of 10 years, at the conclusion of which the Corporation is to have the option of purchasing the plant. It is expected to have the scheme completed by the end of 1916, when the agreement with the Colonial Gas Association expires.

The proposal to utilise the water supply system of Grafton and South Grafton (N.S.W.) in connection with a hydro-electric power scheme has been adopted by the Councils. The scheme is estimated to cost £23,000.—*Tenders.*

The Melbourne City Council has decided to give a H.T. supply to the mining school in connection with the research work into the manufacture of high speed tool steel.

In connection with the lighting of St. Kilda's Road, it is stated that the Electric Supply Committee will shortly have before it a big scheme for the lighting of this thoroughfare.

ELECTRIC PUMPING.—The Works Committee of the Brisbane City Council reported on a scheme for providing water for the city ba-hs, street watering and drain-flushing purposes. It was suggested that the proposed reservoir on the crest of Spring Hill should be supplied with water from the river by a turbine pump installed on the river bank, with a capacity of about 650 gallons a minute. It was estimated that the cost of the pumping station and main would be about £1,900. The City Electric Light Co. had offered to supply power for pumping at 106d. per unit provided the pumping was carried out between 11 p.m. and 7 a.m. The engineer estimates that the price worked out at 120d. per 1,000 gallons for pumping, which, together with working expenses, would not exceed 15d. per 1,000 gallons pumped. It was pointed out that the authorised loan for the work was £13,000, but the estimate was made in 1910, and that the extra cost of labour and material and the extended nature of the scheme now submitted must be taken into consideration. The City Council adopted the report.—*Tenders.*

Bacup.—LOAN APPLICATION.—The T.C. has decided to apply to the L.G.B. for sanction to a loan of £300, for the purpose of supplying electricity to a new factory.

Birkenhead.—PRICE INCREASE.—The Electricity Committee of the T.C. has decided to increase the charge for current to ordinary consumers for lighting and power from the New Year by 7½ p.c. and to pre-payment meter consumers by ½d. per unit.

Bolton.—LOAN SANCTION.—The L.G.B. has sanctioned the borrowing of £2,000 and £215 by the T.C. for the supply of electrical energy to Messrs. W. A. Openshaw, Ltd., Hill Fold Mills.

Bo'ness.—PROPOSED EXTENSION.—At a special meeting of the T.C., on Friday last, a letter was read from the National Electric Construction Co., requesting consent to a permanent extension of the burgh electricity works in place of the proposed temporary extension recently approved by the Secretary for Scotland. Plans and specifications of the new works, submitted by the company, showed that the proposal was to introduce a 500-kw. steam turbine set, together with an extension of the power station and other additions estimated to cost, in all, about £10,000. The company stated that the proposed extensions were imperative to meet the demands upon the station. The Council, after consideration, agreed to call in the services of an independent engineer to report on the state of the works and the necessity for the extension.

Burnley.—INSURANCE.—The electrical engineer having reported that he does not consider the plant of the electricity department sufficiently insured against damage by fire, the Electricity Committee has resolved to obtain a covering note for a further £20,000 on the plant in the main generating station, sub-stations and sub-station buildings, and to obtain tenders for the valuation of the whole plant installed at the electricity works, with a view to re-arranging the insurance against damage by fire.

Brandon and Byshtottles.—**STREET LIGHTING.**—The Council is considering a letter from the Brancepeth Coal Co., requesting payment in full of its street lighting account. It was reported that three collieries had accepted the Council's basis that lighting should only be paid for according to the actual hours of burning, but the Coal Co. had returned the account, and pointed out that it had put down machinery and plant, was having to pay increased wages, and that the cost of coal for supplying current had advanced.

Bath.—**HOSPITAL LIGHTING.**—The electrical engineer reported that the Bath War Hospital was to be lighted with electricity, and for that purpose it would be necessary to extend the main from the sub-station at Portway works, at a cost of £170. The Mayor had authorised him to make an offer to supply electricity at a flat rate of 4d. per unit. The Electricity Committee recommends that this offer be confirmed, the work required be put in hand at once, and that the War Office be requested to erect the building required for the sub-station at the hospital.—*Bath Herald.*

Continental.—**RUSSIA.**—The Minister of Trade has submitted proposals to the Moscow authorities for reduced electric lighting and early hours for theatres, the owners of which, however, prefer later hours with fixed duration of performance. Warehouses must cut off current by 7 p.m., and restaurants must reduce their light by 30 per cent. compared with the previous year. Cinematographs are to have four hours per day, like the theatres, but double time on holidays. The T.C. has replied objecting to the proposals, and suggesting decreased current supply, so that the use of improved lamps would help. The Council has already reduced the current supplied in the town thoroughfares.

In Tulsa, incandescent lamps are being used in place of arc lamps, owing to lack of carbons.

The Karkoff Electric Station Bureau has submitted an estimate to the T.C. for changing over from gas to electric lighting.

Cuba.—With a view to displacing three stations of insufficient capacity, there has been erected in Havannah a single large plant capable of supplying the current required for lighting, power and traction. The equipment of this station comprises three groups of turbines, of 12,500 kw. each. The current is generated at 2,200 volts, and distributed at 6,000 volts, and 220 volts, according to its application. The installation of a fourth group of plant is in contemplation.

Dewsbury.—**PLANT EXTENSION.**—The T.C., on Thursday last week, considered a proposal of the Electricity and Tramways Committee to purchase a secondhand generating set from Dumbarton and install it at an estimated expenditure of £3,000, the money to be provided out of the profits of the undertaking. There was a lengthy discussion on the matter. The chairman of the Electricity Committee explained that the present plant at the electricity works was working very near to the margin of safety owing to heavy demands, and a breakdown would be a serious matter. The proposed purchase was only a temporary expedient. The Committee's proposal was approved. The Council also approved a recommendation that the present charges for electricity be continued until further notice.

Dinas Powis.—The Bishop's Palace at Llandaff is being rebuilt and will be lighted throughout with electricity generated upon the premises. It has not yet been decided whether the improved lighting of the Cathedral shall be by gas or electricity.

Mr. R. H. Fletcher (of Messrs. Lewis & Fletcher, electrical engineers, Cardiff), has been appointed consulting engineer for the electrical undertaking of the District Council.

Hawick.—**RATING APPEAL.**—The Urban Electric Supply Co., Ltd., appealed against the valuation of the electricity works and mains in the burgh, which were assessed at £2,420, and which the Burgh Valuation Committee reduced to £2,300. The Court affirmed the valuation of the Committee, less £25, which was allowed as a further deduction from the valuation.

London.—**BATTERSEA.**—The Electricity Committee reports that the work of linking up the electricity supply undertakings of Battersea and Fulham has almost been completed, and that satisfactory tests of the cables have been made. The Committee recommends that it be authorised to arrange for the supply of electrical energy from and to the Fulham Council as and when required.

HACKNEY.—The Electricity Committee reports that the 3,000-kw. Willans turbo-alternator set has undergone official tests. The borough electrical engineer has been authorised to place an order with Messrs. Ferranti for a grid-type earthing resistance of 200 amps. capacity for three minutes, at a cost of £105.

Lynton.—**STREET LIGHTING.**—The Electricity Co. has informed the P.C. that it is not in a position to make any substantial rebate on the cost of public lighting, solely on the ground that the lamps are extinguished early, as this does not reduce the cost of maintenance to any marked extent.

Luton.—**COAL PRICES AND EXTENSIONS.**—The town clerk is in communication with the B. of T. in reference to matters relating to the electricity coal contract. The contractors state that the pitmouth prices for best-coal coal for the year ended November 30th, 1914, were at 7s. per ton, and for the 12 months ending November 30th, 1915, 10s. 3d. per ton. The colliery pro-

prietors contend that they were entitled to 13s. 3d. as being only 4s. per ton in excess of the average price received by them during the year ended June 30th, 1914, and that they are not restricted by the Price of Coal Act to 4s. upon the actual price paid by any one purchaser. The L.G.B. has advised the Electricity Committee that it is prepared to sanction loans, amounting to £27,790, on being furnished with a copy of a resolution of the Council in respect of the difference (£2,140) between that sum and £25,650, the amount of the original application. The Board states that it has deducted from the total amount (£30,327) the sum of £2,537 remaining unexpended on account of the loan of £5,000 sanctioned in August, 1913, for general extensions of mains, as it considers that this balance should be used towards defraying the cost of the mains now proposed to be laid in connection with the present scheme for additional plant. The full amount for the proposed new cooling tower would be sanctioned on condition that the outstanding debt on any of the depot buildings which may have to be pulled down will be paid out of the reserve fund. The Electricity Committee proposes to reply to the Board's remarks to the effect that it has erroneously deducted the £2,537, as the £25,650 represented the net cost after deducting the first-mentioned figure; and to remind it that in November last the Council undertook to pay out of the reserve fund any outstanding loan debt on any of the depot buildings, which will be demolished or interfered with by the new cooling tower. The Council, therefore, again requests the Board to sanction the £30,327 originally applied for. The Committee also proposes to apply for sanction to borrow the additional sum of £1,677, being the difference between the amount of the original application (£25,650) and the £30,327 asked for. Subject to the requisite order being granted by the B. of T., the Electricity Committee has asked the Council to agree to a supply of energy being given to the premises of Messrs. Hewlett & Blondeau. The agreement will provide for a fixed period of 14 years, determinable at the end of the seventh year, and for the payment by the company of a total minimum sum of £1,750 during the first seven years.

Middlesbrough.—**CHEAP ELECTRICITY.**—The Corporation has agreed to a request by Mr. Gridley, of the Cleveland and Durham Electric Power Co., who suggested that in the case of seven of the company's officials whose duties require them to reside in the town, a deduction should be made by the company from the Corporation's bill in respect of energy supplied to the residences of these officials in order to give them the same facilities for obtaining energy at a nominal rate, which they would enjoy were they able to get current direct from the company's mains. Eight units for every lighting unit and two units for every heating unit used by the officials are to be deducted from the Corporation's account.

Newport (Mon.).—**PLANT EXTENSION.**—It is proposed to establish a factory at Maesglas, and, according to the report of the electrical engineer, it is desired that the Corporation should provide certain electrical equipment costing about £3,170, or alternatively, about £4,450. The engineer has submitted the proposed terms of agreement, providing for the payment to the Corporation at the termination of the period of supply, of certain amounts in respect of the equipment to be furnished, and the Electricity Committee has decided to instruct the engineer to order the necessary cable and plant and other equipment when he has been informed that the terms of supply were approved.

Nuneaton.—**LOAN SANCTION.**—The T.C. has received from the L.G.B. sanction to a loan of £6,000, less £778 received for the sale of a 200 kw. set, for extensions to the plant at the electricity works, and has suggested that expenditure for mains and services should be met out of the unallocated balance of profits of the undertaking.

Philippines.—A hydroelectric central station is about to be established at Lucban, in the Province of Tayabas. The estimated cost of the station is 150,000 pesetas. The machinery will be American, and the constructing and working company, organised by the municipality, will be formed with Philippine capital. The power will be obtained from a waterfall on the River Pagsaippi, which belongs to the municipality. Lucban is one of the centres of the Philippine hat industry.—*Industria e Invenientes.*

Reigate.—**STREET LIGHTING.**—The T.C. has referred back to the Highways Committee a recommendation that the E.L. Committee should allow a reduction at the rate of £1 6s. per annum for all street lamps not lighted from October 23rd, and so long as the lighting restrictions remain in force.

Rugeley.—**PROV. ORDER.**—The Rugeley Gas Co. has informed the U.D.C. of its intention to apply to the B. of T. for a prov. order to supply electrical energy for public and private purposes.

San Domingo.—The need for the erection of a new electric light station has been felt for some time in this city, the local Press having made frequent references to the deficiencies of the existing lighting arrangements. In June, 1914, the municipality signed a contract with a certain Senor Michelena, who proposed to start a company to supply the city with electricity. In March last, however, this contract was cancelled for various reasons, and a municipal committee appointed to study measures for the provision of the public services. A practical preliminary step already taken is a resolution to raise a loan for the installation of the new central station.

Sheffield.—The offer of the electric supply department to provide for £185, the necessary switchboards and fittings for charging the electric vehicles of the Health Department has been accepted. The superintendent of the Heeley Health Department depot has received instructions to extend the electric lighting in those buildings now lit by gas, the supply pipes of which are worn out. The Electric Supply Committee has undertaken to bear the annual charges in respect of the expenditure incurred in laying a new feeder cable from Kelham Island to Newhall Road; mains are to be extended to various parts of the city at an estimated cost of £5,910. The L.G.B. has sanctioned the borrowing of £2,500 to cover the cost of increasing the accommodation for coal storage at the Neepsend power station, and the installation of coal-handling plant, &c., and £1,200 for the provision of rails, &c., crane track, sleepers, and reinforced concrete retaining walls. The Committee has decided to lease a piece of land for the erection of an electric furnace, and has granted permission to place three 150-kw. transformers in the Forncett Street sub-station for operating the furnace.

L.G.B. INQUIRY.—Notice has been given that an inquiry will be held on January 21st into the application of the T.C. for a provision to authorise the transfer of the Kelham Island power station from the tramways to the electric lighting department, and to amend any Acts as may be desirable.

Stockton-on-Tees.—**BULK SUPPLY.**—The Corporation has ordered a new rotary converter for the electricity works, to enable a larger supply to be obtained from the Cleveland and Durham Electric Power Co. The engineer reports that the saving in capital expenditure in providing rotaries, as compared with new steam generating plant and the extension of the buildings, will fully warrant the change. There will also be a saving due to the present increased price of coal.

Swansea.—The Committee has adopted a recommendation of the borough electrical engineer (Mr. J. W. Burr) to dispose of two sets of engines and dynamos at the works, which would leave sufficient space for the installation of a 3,000-kw. turbine; the alteration would also benefit the staff, which, owing to enlistments, is now overworked.

It was decided to extend the mains to the new public elementary school, at a cost of £800, providing the Education Committee paid the interest and sinking fund on the cost of the extension for five years, in addition to the annual charges for current consumed.

South Shields.—**PROPOSED LOAN.**—The T.C. has adopted the recommendation of the Electrical Committee that application be made to the Treasury and the L.G.B. for sanction to borrow £1,000 to carry out a scheme for the hiring out of motors, and £850 for a motor wagon.

St. Annes.—Mr. J. H. Clothier, the electrical engineer, reports a continued falling off in supply for lighting and traction, which is, however, more than compensated for by heavy increases in supply for both industrial and domestic power. In regard to coal, the engineer says the question is causing great anxiety; although he has sent out a number of inquiries, up to the present he had not been able to secure a renewal or offers for any quantity, with the exception of a 100-ton lot.

Torquay.—The T.C. has been informed that the L.G.B. has consented to an extension of plant at the electricity works.

Walsall.—**NEW PLANT.**—The Electricity Committee reports that tenders have been obtained for a turbo-alternator set to replace the commandeered plant, and that it had given instructions for the sale of certain obsolete plant. Instructions have also been given for a further reduction in the public lighting, by about 300 lamps, and in this connection the borough surveyor has been authorised to negotiate with the electrical engineer as to the replacement of the high-power electric lamps in the centre of the town by metallic-filament lamps of lower power.

Watford.—**STREET LIGHTING.**—The U.D.C. has adjourned consideration of the question of public lighting until immediately after the current financial year, but in the meantime, £2,500 is to be paid on account for the year to the Electricity Committee.

Wigan.—The Electricity Committee reported that it had purchased 16,000 tons of coal from the Bryn Hall Colliery Co., at 14s. 6d. a ton, as compared with 11s. 6d. paid to the same firm in March last. This quantity, it was stated, would provide for the requirements until about next Christmas. —*Wigan Observer.*

Wolverhampton.—**LOAN APPLICATION.**—The Electricity Committee proposes to apply to the L.G.B. for sanction to borrow £1,750 for mains extensions and for permission to spend £670 out of the loans already raised in connection with the above extensions.

Bolton.—Through running from Bolton to Clifton, through Farnworth and Kearsley, on the Corporation and South Lancashire tramway systems has been discontinued, the passengers having to change cars at Moses Gate. Representations are being made to the responsible authorities for the re-establishment of the service which has been in operation several years.

Bolton-on-Dearne.—**LIGHT RAILWAY APPLICATION.**—The new application promoted by the Dearne Valley Light Railway Board for power to construct light railways between Wath-upon-Dearne and Bolton-on-Dearne is to form the subject of an inquiry by the Light Railway Commissioners at the end of this month.

Bournemouth.—**LOAN SANCTION.**—The T.C. has received the consent of the B. of T. to borrow forthwith up to £6,000 for the reconstruction of a portion of the tramway track at Constitution Hill between the borough and Poole.

Bradford.—**FEMALE LABOUR.**—The Tramways Committee has decided that, in accordance with the recommendation of the general manager (Mr. C. J. Spencer), instructions be issued to make arrangements for a certain number of women conductors, and that one or two routes be experimented with; that the rate of wages and the hours of duty be the same as for male conductors, with the exception of longer meal reliefs; and that the necessary uniforms be purchased and other essential equipment for such experiment be immediately put in hand; and that all women be dispensed with at the conclusion of the war on the return of the former male employés, or as soon as sufficient male labour can be obtained. It has also been resolved that no women who are engaged in productive employment in the textile trade shall be employed as conductors.

In view of the exceptional conditions prevailing in regard to the employment of women, owing to the war, the Tramways Committee has given authority for increasing the maximum wages of the female staff at the tramway offices from 20s. to 30s. per week.

Burnley.—The manager of the Corporation tramways reports a shortage of drivers and has been authorised to ask the recruiting tribunal for the retention of tramway drivers attested under Lord Derby's scheme. It was reported that the Postmaster-General desired to transfer the carriage of mails from the tramways to the railway company, and desired the present agreement to end. The Committee resolved that the application be not acceded to.

Gateshead-on-Tyne.—**TRAMWAY RECONSTRUCTION.**—At a meeting of the T.C. on the 5th inst., the Town Improvement Committee reported on the application of the Gateshead Tramway Co. for leave to substitute span-wires suspended from poles placed at each side of Durham Road, from Shipcote to Low Fall terminus, in place of the existing bracket construction. The Committee recommended the Council to agree to the following arrangements:—That the application of the company be granted on condition that the whole of the centre poles on the several routes in Gateshead be removed by, and at the sole cost of, the company within two years of the date of the declaration. If at any time any of the new poles are found to be in the line of a new street, the position of the pole to be altered at the cost of the company. Each pole to be fixed and fitted with a base similar to those on the west side of Durham Road, to the satisfaction of the surveyor. The Committee also recommended that the application of the company for permission to carry a double set of rails along Sunderland Road, in accordance with plans submitted, be granted on condition that the company pays £180 towards the cost of widening the road. The recommendations were adopted.

Glasgow.—**RECORD RECEIPTS.**—The tramway receipts for the week ended Saturday, January 8th, are the highest so far recorded in the history of the tramway service. The total receipts from passengers amounted to £24,236—£1,100 better than the previous best, and over £3,000 more than in the corresponding week a year ago. The major portion of the revenue came from the 3d. and 1d. fares.

London.—Considerable delay was caused on the Bakerloo tube railway, on Wednesday, by an outbreak of fire on a train between Oxford Circus and Regent's Park Station.

Manchester.—**FEMALE LABOUR.**—About 200 women conductors are now employed on the tramway system, and many tributes have been paid to the courtesy and efficiency with which they do their work. It is expected that even larger use of the services of women as guards will have to be made in the near future.

Newcastle-on-Tyne.—**INCREASED SERVICES.**—The tramway service in the city and the suburbs, which some weeks ago closed down at 9 o'clock at night, is gradually being extended, especially on the more distant routes, as more female workers are being started, and as further volunteer workers are being obtained.

Reading.—**FEMALE LABOUR.**—The T.C. has engaged 26 women for the tramways, 22 as conductors, two as inspectors, and two as clerks. The first named are paid the same wages as men, viz. 5d. per hour; the inspectors, 30s. per week; and the clerks, 25s. per week.

Rotherham.—The T.C. has been recommended to agree to the Sheffield Tramways Committee's proposal to refer all matters in dispute in connection with the running of additional cars for munition workers to an independent arbitrator, subject to certain protective conditions.

TRAMWAY and RAILWAY NOTES.

Batley.—The T.C. has instructed the town clerk to write to the Yorkshire Electric Tramways, Ltd., protesting against the recent increase in fares on the Batley to Dewsbury section of its line.

Rochester.—TRAFFIC DIFFICULTIES.—The City Council has received a petition protesting against the stoppage of the tramway service on Stroud Hill, and in this connection a letter was received from the general manager of the Chatham and District Light Railways Co., which pointed out the difficulties of maintaining the service owing to over 60 per cent. of the employees joining the Colours. Partial service, however, could be given, but only by curtailing the service at Frindsbury Hill. As the result of a subsequent conference, however, the general feeling was that the Frindsbury Hill service was by far the more important, and in the result the company intimated that an effort would be made to provide a modified morning service at Stroud. To maintain an afternoon or evening service was practically impossible.

Sheffield.—In view of the services rendered to the State by the Pure and Applied Science Departments of the Sheffield University, and the depletion of the income from students' fees, the City Council has been recommended to make special grants totalling £5,000 out of the revenue of the tramway undertaking.

TELEGRAPH and TELEPHONE NOTES.

New Wireless Receiver.—According to the *Madrid Centinero*, trials have been made at Corunna of a radiotelegraphic receiver, invented by Prof. Gonzalo Bravo, with excellent results. The increase in sound has allowed of the hearing of messages from Madrid and all the stations on the Spanish military system, including those in Africa. It has also been found possible to receive by ear, with the telephone, messages from the Eiffel Tower, Poldhu, and Norddeich, and to record on the Morse tape messages from all the stations mentioned.

Wireless Communication Across the Pacific.—Communication has been established between the United States and Japan by way of the Marconi wireless stations at San Francisco and Honolulu in conjunction with the new Japanese Government station at Funabishi, near Tokio. The distance between terminals is 3,400 miles. Commercial service will shortly be commenced.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—January 19th. P.M.G. Carbon and manganese powder, manganese chloride, chloride of ammonia, porous pots, outer jars and carbon blocks. See "Official Notices" January 7th.

February 18th. Melbourne, Brunswick and Coburg Tramways Trust. Six radial trucks.

BRISBANE.—January 23rd. P.M.G. Wheatstone apparatus. See "Official Notices" Dec 17th.

April 15th. P.M.G. Common battery multiple switchboard, or automatic or semi-automatic switchboard, and associated apparatus. See "Official Notices" December 31st.

MELBOURNE.—February 16th: 51 electric staff instruments, February 23rd: Two commutator slotting machines, for the Victorian Railway Commissioners.

February 2nd. Agent-General for Victoria. Fuse distribution boxes and fuses, for the Victorian State Railways. See "Official Notices" to-day.

SYDNEY.—January 31st. Three electrically-operated railway freight-car transferers, for Jones Bay wharfe, Pyrmont. Particulars from Engineer-in-Chief of the Harbour Trust, Circular Quay.

January 20th. Silk-covered wire, for P.M.G.*

February 7th. Metropolitan Board of Water Supply and Sewerage. For No. 1 pumping station at Ultimo. Two centrifugal pumps and electric motors (1,000 gallons per minute each), switchboards, starters &c. Contract No. 1,301.*

February 28th. Municipal Council. Tenders for induction regulators. Specifications (11s. 6d.) from the Electric Light Department, Town Hall, Sydney.

May 3rd. N.S.W. Railways and Tramways Department. One 2,500-KW. turbo-alternator, for Zara Street, Newcastle, power house. Specifications (20s.) from the Engineer's office, 61, Hunter Street, Sydney.

Birkenhead.—January 17th. Corporation Electricity Department. Washed and unwashed rough slack coal for the period ending June 30th, 1916. Mr. G. P. Shallcross, Electrical Engineer, Craven Street.

Croydon.—January 24th. Corporation. Stores for the Tramways Department. Particulars from the Manager, Tramways Department, Thornton Heath.

Dublin.—January 21st. Corporation. Arc lamp carbons. See "Official Notices" to-day.

London.—ISLINGTON.—January 21st. B.C. Twelve months' supply of engine-room stores, electrical fittings, meters, cables &c. See "Official Notices" Dec 31st.

BATTERSEA. The B.C. is recommended to invite tenders for the supply of oil, engine-room stores, electricity meters, service joint-boxes, troughing, ironmongery, &c., and coal, for the electricity undertaking, for alternative periods of three, six, nine and twelve months from March 31st next.

H.M. OFFICE OF WORKS.—January 17th. White earthenware electric lamp shades. Forms of tender from Controller of Supplies, H.M. Office of Works, 18, Queen Anne's Gate, S.W.

Manchester.—January 18th. Corporation. Sub-station converters, traction boosters, high and low-pressure steam piping, for the Electricity Committee. Specification from Mr. F. E. Hughes, Secretary, Electricity Department, Town Hall.

New Zealand.—AUCKLAND.—February 23rd. City Council. Centrifugal pumping electric motors, and automatic starting and controlling apparatus, for the four city pumping stations. Specifications from the office of the Water Board, Town Hall, Auckland.

DUNEDIN.—May 17th. City Council. (1) Tramcar bodies; (2) electrical equipment. Plans, &c., from the Town Clerk, Dunedin.

RAETHIL.—March 14th. Town Board. 40-H.P. hydro-electric generating set, switchboard, &c. Plans and particulars from Messrs. H. W. Climie & Son, Raethil.*

WELLINGTON.—March 8th. Public Works Office. One 3,000 kW. generator and one 4,300-H.P. water turbine, at Lyttelton, for the Lake Coleridge electric power scheme. Specifications, &c., may be consulted by British firms at the office of the H. G. Commissioner in London for New Zealand, at 13, Victoria Street, S.W.

Pembroke (Dublin).—February 7th. U.D.C. Twelve months' supply of electrical goods. Specifications from the Town Hall, Ball's Bridge, Co. Dublin.

South Africa.—January 17th. S.A. Railways Administration, Johannesburg. 74 966 draw-wire tungsten lamps.*

Spain.—Tenders have just been invited by the municipal authorities of San Ildefonso (Province of Segovia) for the execution of the electric lighting of the town during an indefinite period.

Todmorden.—January 24th. Electricity Department. 1,000 tons of steam slack or nuts (10 tons per week). Tenders to Mr. H. Garratt, Town Clerk, Municipal Offices.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Australia.—The Broken Hill Associated Smelters Pty., Ltd., has accepted the tender of Messrs. Fraser & Chalmers for two 2,000-KW. turbo-alternators.

Bradford.—The Electricity Committee has given instructions for a spare rotor for the 3,000 KW. turbo-generators at the electricity works to be obtained from the British Thomson-Houston Co.

Bristol.—The Docks Committee of the T.C. has accepted the tender of the British Thomson-Houston Co., Ltd., for a motor starter for a two-ton electric capstan at the Royal Edward Dock.

Bury.—The tender of Messrs. Jas. Byrom, Ltd., has been accepted for the extension of the boiler house at Chamber Hall generating station.

Chesterfield.—The T.C. has been recommended to accept the tender of the British Thomson-Houston Co., at £1,150, for the supply of a 6,600-volt, 30 period, 600-H.P. induction motor installation, subject to a loan being sanctioned.

London.—The Metropolitan Water Board has accepted the tender of Messrs. F. Smith & Co. for copper cable for coal-unloading plant, the value of the contract being £175.

The Metropolitan Asylums Board has accepted the tender of Messrs. J. W. Gray & Son, at £25, for repairing defects in the internal telephone system at Queen Mary's Hospital.

Luton.—The Jackson Electric Stove Co., Ltd., has obtained the order from Messrs. Dadeney & Johnson for a complete cooking equipment for their restaurant in Luton. The installation is designed to cope with the requirements of 250 people.

The Electricity Committee recommends the acceptance of the tender of Messrs. Aiton & Co., at £758, for the supply of pipework for the additional cooler. Six tenders were received.

Nuneaton.—The T.C. has accepted the following tenders:—

Feeder panel.—British Thomson-Houston Co., Ltd., £71.
Overhead electric line.—B. L. & Helsby Cables, Ltd., £137.

Southampton.—The T.C. has accepted the tender of Messrs. Driver & Co., at £583, for the supply of 60,000 deal blocks for the Tramways Department.

Sunderland.—The T.C. on Wednesday accepted the following tenders:—

Ferranti, Ltd.—Meters.
Underfeed stokers.—B. L. & Helsby Cables, Ltd., £137.
R. Hudson & Son.—Work in connection with installation of stokers.

Stockport.—The Tramways Committee has accepted the following tenders:—

Steelbanding wire.—British Westinghouse Co.
Field coils for motors.—Dick, Kerr & Co., Ltd.
Bell pushes, P. & B. Tape.—L. Andrew & Co.
Castings.—Malleable Steel Castings Co.

The Electricity Committee has accepted the tender of the Yorkshire Commercial Motor Co. for a steam wagon, fitted with mechanically operated tipping end body, rubber tires, and three-speed gear, £695.

Wigan.—The E.L. Committee has purchased 16,000 tons of coal from the Bryn Hall Colliery Co., Ltd., at 14s. 6d. per ton, compared with 11s. 6d. paid last March.

FORTHCOMING EVENTS.

Association of Supervising Electricians.—Tuesday, January 17th. At 8 p.m. At St. Bride's Institute, Bride Lane, E.C. Half-yearly meeting and informal discussions.

Nottingham Society of Engineers.—Wednesday, January 19th. At 7.30 p.m. At the Weibek Hotel, Milton Street. Paper on "The Use of Electricity in the Conveyance of Coal from the Working Face to the Pit Head," by Mr. R. A. Sheldon.

Institution of Electrical Engineers.—Thursday, January 20th. At 8 p.m. At Victor & Emsbankment, W.C. Paper on "The Principles of Modern Printing Telegraphy," by Mr. H. H. Harrison.

Chemical Society.—Thursday, January 20th. At 8.30 p.m. At Burlington House, Piccadilly. Ordinary meeting.

Royal Institution of Great Britain.—Thursday, January 20th. At 8 p.m. At Albert Hall, S.W. Lecture on "The Utilisation of Energy from Coal: The Chemistry and Economics of Coal and its By-products," by Prof. W. A. Bone, F.R.S.

Friday, January 21st. At 5.30 p.m. Lecture on "Problems in Capillarity," by Prof. S. R. J. Dewar, F.R.S.

Greenock Electrical Society.—Friday, January 21st. At 7.45 p.m. At the Temperance Institute, 14, West Stewart Street. Paper on "Direct current Machines," by Mr. J. A. Kinnaird.

Institute of Mechanical Engineers.—Friday, January 21st. At 8 p.m. At St. George Street, S.W. General meeting.

Association of Mining Electrical Engineers (West of Scotland Branch).—Saturday, January 22nd. At 4.30 p.m. At the Royal Technical College, Glasgow. Paper on "Electrical Shaft Winding," by Prof. D. Burns.

Manchester Association of Engineers.—Saturday, January 22nd. At the Grand Hotel, Aytoun Street. Paper on "Cast Iron: The Strength and Properties of Castings," by Mr. E. L. Rhoad.

NOTES.

Information Invited.—Will any of our readers who have lately had unfortunate dealings with a firm supplying refills for electric pocket lamps kindly place themselves in communication with the Editors of THE ELECTRICAL REVIEW, sending particulars? The strictest confidence will be preserved.

Foreign Trade.—FIGURES FOR DECEMBER AND FOR THE YEAR.—The following are the electrical and machinery figures given in the official returns for December:—

IMPORTS.	Month of December.	Inc. or dec.	Twelve months, or 1915.	Inc. or dec.
Electrical goods and apparatus, excluding machinery and un-insulated wire	112,003	+	22,087	1,096,234
Machinery	700,808	+	156,572	8,847,844
				+ 2,135,345

EXPORTS.	Month of December.	Inc. or dec.	Twelve months, or 1915.	Inc. or dec.
Electrical goods and apparatus, excluding machinery and un-insulated wire	258,792	+	74,429	3,180,809
Machinery	1,474,256	+	17,975	19,192,163
				- 12,170,940

Fatalities.—An inquest was held on Monday into the cause of death of James Hughes. The evidence of a taxi-driver was to the effect that he was on his stand in Piccadilly on the previous Friday when he saw two men on an extended telescopic ladder tower. They were repairing electric arc lamps. He noticed that while they were at the foot cleaning a globe the ladder wagon was blown by the wind for some 20 yards on its wheels. The men fetched it back, and, having placed it in position, went to the top to fix the globe. Suddenly the ladder was blown over. Hughes was removed to the infirmary, but was dead on arrival. The other man (Herbert Ball) was badly injured. Alfred Wilkinson, a superintendent of the department, said he did not think the accident would have happened if the jack had been used and the ladder had been set on its feet instead of being left on the wheels. He thought there had been an error of judgment. A verdict of "Accidental death" was returned.

ROCHDALE.—Last Wednesday an inquest was held on Richard Richards (52), labourer, of 4, Slack Street, Rochdale, who was found terribly injured in the motor room at Messrs. Kelsall and Kemp's mill. It appeared that deceased was working on some

repairs in the dynamo room, and was asked by a colleague to take a wire template from the dynamo room to the workshop in Penn Street. Shortly afterwards the assistant engineer at the mill heard the motor in the adjoining room start running, and immediately afterwards there was a shout for help. He went into the adjoining room, stopped the motor, and found deceased lying on his back with his head against the driving pulley and the wall. He suffered from a compound fracture of the base of the skull, and a crushed right arm, and died later from shock and hemorrhage. Mr. J. H. Chadwick, deputy coroner, said there was no satisfactory explanation as to how the accident happened, although it was suggested that the man was taking a short cut. He had no business to be where he was found, and had he gone the other way round, the accident would never have happened. "Death through misadventure," was the verdict.

WOLVERHAMPTON.—An inquest was held on Friday, last week, at Wolverhampton, concerning the death of Richard Thomas Akers (19), who was killed at the works of the Eftandem Electrical Co. on 5th inst. Mr. Clark-son and Mr. A. C. Skidmore represented the Eftandem Co., Mr. Randle J. Evans appeared for the relatives of the deceased, and Mr. A. Wolfe, H.M. Inspector of Factories, was also present.

Ethel Rose Williams, a girl employed by the Eftandem Co., deposed to a conversation which she had with Akers prior to his death. She said he had called her attention to a wire over a door which was hanging down, and remarked that if he did not put it right some one might have a shock. It was shortly afterwards that the sister of Akers reported that he was on the floor looking unwell. Witness had not seen the wire before Akers called her attention to it. Relying to Mr. Evan, witness said she should think the wire was hanging low enough to touch Akers' head when he went through the door.

John Milroy, a youth said he saw the wire hanging a quarter of an hour before the accident. To witness's knowledge it had been in the same position for about three days, and it was about a yard and a half from the ground.

Frederick Thomas Ridgeway, electrician at the works, said the gale during the holiday blew a shed down, and when work was resumed on the Tuesday after Christmas he had all the fuses withdrawn, and the plant on that particular circuit rendered safe. For the wire in question to be "alive" the fuses must have been put back; but who had done this witness did not know. He had no idea that the wire had been hanging until his attention was called to it. It had been looked at. Two or three men had spoken to him about light, and he had told them they could not have any; he suggested that they should use torches. Witness subsequently discovered that the fuses had been replaced by some one.

After hearing medical evidence, the jury went to inspect the wire, and on their return the foreman said they would like to know who replaced the fuses.

The Coroner said that was a thing they would never know. Whoever did it exceeded his duty, and the one who took upon himself to do it caused the death of this unfortunate youth.

The jury found that "Death was due to electrocution, as the result of an accident."

An "Osram" Electric Vehicle.—We illustrate here-with an Osram electric vehicle which has lately been added to the fleet of express delivery motors employed by the G.E.C. for the delivery of Osram lamps to all parts of the United Kingdom. This van is handsomely finished in dark blue; the gross weight is 2 tons 12 cwt., of which the Edison accumulator accounts for

16 cwt. A load of 2 tons can be carried, the accommodation being sufficient for between 11,000 and 12,000 standard Osram lamps. The average speed on the flat is 10 m.p.h., and between 40 and 45 miles can be covered on one charge. Re-charging is effected by a dynamo at the Osram-Robertson Lamp Works in Hammersmith. In addition to rheostatic braking, a system of hand brakes is provided.

Patents and Alien Enemies.—As the result of an application lodged by Messrs. Ferranti, Ltd., licences granted to the Allgemeine Elektrizitäts Gesellschaft in respect of Patents Nos. 21,027/03, 26,359/12, and 12,926/14, granted to Hamilton, have been avoided.

Institution and Lecture Notes.—**Institution of Civil Engineers.**—On Tuesday last a paper on "The Electric Locomotive" was read by Mr. F. W. Carter, in which the author reviewed the various classes of locomotive that have been evolved, and discussed the comparative merits of the methods employed for transmitting the torque from the motors to the driving axles. The question of stability of the rolling motion of the wheels was considered in connection with the tilting of the rails and the coning of the wheels, and it was shown by novel methods of analytical treatment that, under certain conditions, a "nosing" tendency at high speeds might be anticipated, a remedy being found in the use of guiding wheels elastically centred to align with the main driving wheels. Recent data of tractive-resistance tests on the New York Central and Hudson River Railroad were given, showing conclusively that, for a particular type of coach, the additional tractive resistance per additional coach was a function of the speed, and was independent of the number of coaches, provided this was greater than two, and was a straight-line function of the speed within the limits of the tests. In the discussion which followed, Messrs. Merz Thornton, Aspinall and Roger Smith took part, and the discussion was adjourned to January 25th.

Greenock Electrical Society.—On Friday last a paper was read by Mr. W. B. Smith on "The Economy of Electricity in a Small Household." It was shown that by the general use of electric heating appliances the consumer would ultimately benefit by the consequent general reduction of electricity charges, just as the lighting consumer had already benefited through the cultivation of a power load for central stations. The advantages and costs of electric cooking were fully explained, and figures were advanced from actual results obtained in houses in Greenock.

Institution of Electrical Engineers.—At a meeting of the SCOTTISH LOCAL SECTION held in Glasgow on Tuesday last, Mr. J. R. Beard's paper on "The Design of High-Pressure Distribution Systems" was read and discussed.

A meeting of the MANCHESTER LOCAL SECTION was held on Tuesday last, when a paper was read by Prof. Miles Walker on "The Predetermination of the Performance of Dynamo-Electric Machinery," and a discussion followed.

At a meeting of the NEWCASTLE-ON-TYNE LOCAL SECTION on Monday last, Mr. J. R. Beard read his paper on "The Design of High-Pressure Distribution Systems," and a discussion followed.

At the meeting of the YORKSHIRE LOCAL SECTION on Wednesday last Mr. Beard's paper was read and discussed.

Educational.—**UNIVERSITY OF LONDON, UNIVERSITY COLLEGE.**—A course of six lectures on the "Electrical Production of Nitrates for Fertilisers and Explosives" will be delivered by Mr. E. Kilburn Scott, M.I.E.E., A.M.I.E.S.C.E., on Wednesdays at 5.30 p.m., beginning on January 26th, 1916. The first lecture is open to the public without fee, on application to the Secretary, University College, Gower Street, W.C. The course is open both to members and non-members of the University, the fee being £1 11s. 6d.

Volunteer Notes.—**ENGINEERING INSTITUTIONS' VOLUNTEER ENGINEER CORPS.**—Headquarters, Chester House, Eccleston Place, S.W.—Orders for week commencing January 17th, 1916.—By Lieut.-Col. C. B. Clay, V.D., Commandant.

Drills, 6.25 to 7.25; 7.25 to 8.25 p.m.

Saturday, January 15th.—Uniform Parade, 4.45 p.m., Chester House.

Monday, January 17th.—Sections 1 and 2, Technical; Sections 3 and 4, Squad, Signalling Section and R-ecruits.

Tuesday, January 18th.—School of Arms, 6 to 7 p.m.

Thursday, January 20th.—Shooting for Sections 3 and 4.

Friday, January 21st.—Sections 3 and 4, Technical; Sections 1 and 2, Squad, Signalling Section and R-ecruits.

Sections for Technical Parade at Headquarters, London Electrical Engineers, 46, Regency Street S.W.

Sections for Shooting Parade at Miniature Range.

Unless otherwise ordered, all Parades at Chester House.

E. G. FLEMING,

Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON REGIMENT (VOLUNTEERS).—Battalion Orders by Colonel S. G. Grant (Officer Commanding), Thursday, January 13th, 1916:—

Weekend Parades.—**Saturday.**—The Battalion will parade at Baker Street Station at 2.30 p.m. and proceed by train to Dollis Hill, where they will detrain, proceeding by march route to Wembley Park.

Sunday.—The Battalion will parade at 9.30 a.m. at Liverpool Street Station (low-level entrance) and proceed by train for entrenched duties, arriving in town, on the return, about 6 p.m. Members will make their own arrangements for lunch.

Musketry.—The Acton Range will be open on Saturday, the 15th inst., both morning and afternoon, for Inter-Platoon Competition practice. Shooting to commence at 11 a.m. and 2 p.m. Members when sending in their names should advise the Musketry Staff at what time they will attend, to enable necessary arrangements to be made. Members must parade in Uniform. Names must be sent into Headquarters not later than Friday midday.

As the days are short, it is hoped members will help the Musketry Staff by attending punctually.

A. G. JOINER, Major and Adjutant, O.B.C.

Social.—On the last day of the old year, Messrs. Cryse Co. Ltd., of Bedford, entertained their employés. The works closed early, and at 6 o'clock the staff and the employés, numbering some 300, sat down to high tea. Mr. H. S. Dawson extended a welcome to all, after which the party moved to the entertain-

ment hall, where a programme was carried out by London artistes, Mr. Rer. Wishart's mystery box trick being especially appreciated. At 9 o'clock the company adjourned for dancing, recreation and refreshment. On the stroke of midnight, hands were joined in one immense circle and "Auld Lang Syne" was sung with feeling and enthusiasm, which brought the evening to an end. All the arrangements were carried out by the staff, under the direction of Mr. A. R. Powell and Mr. A. R. Harrison.

French Prizes.—The French Academy of Sciences has awarded the Hébert prize for physics to Prof. Poincaré for his important services to telegraphy and telephony and his method of harmonic analysis; the Hughes prize to M. R. Marcelin a young scientist of the first rank, who was killed in September, 1914; and the Gaston Planté prize to M. Marcel Moulin, for his researches in radiation, who was killed in September, 1914. Out of 37 awards, no fewer than 11 were to men who had fallen in battle.

Manchester Engineers' Demand Refused.—The Committee on Production announced on Monday that it had decided to refuse the application of engineers in the Manchester district for an advance of 6s. a week on time and 15 per cent. on piece rates. The Committee declares that no substantial case for an increase has been made out. Some 30,000 skilled engineers and about the same number of semi-skilled and unskilled workers are affected by the decision. Early last year the men received an advance of 3s. a week and 10 per cent. on piece rates.—*Manchester Courier.*

Appointments Vacant.—Shift engineer and three attendants, for Military Camp in North Yorkshire; shift engineer (£2), for Queen Mary's Military Hospital, Wembley; shift engineer, for the Walsall Corporation electricity department; charge engineer (£3), and junior engineer (£2), for the Southwark B.C. electricity department; station assistant and shift engineers, junior engineers and attendants, foreman of works, pumping engineers, station fitters, engine drivers, stokers, trimmers, linemen, wiremen, mates and labourers, for the Military H.Q. electric power installations in the Northern Command. See our advertisement pages to-day.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—Mr. H. F. RICHENS, late assistant distribution engineer at the Stockton-on-Tees Corporation electricity works, has taken up an appointment with Messrs. Naylor Bros. (London), Ltd., Southall, Middlesex.

The Wembley B.C. has increased the salary of Mr. H. OSWALD, one of the engineers in charge at the electricity works, from £104 to £130 per annum as from January 12th, 1916.

Mr. ERNEST A. HILTON, who is employed in the Manchester Corporation electricity department, was married at Marple last week to Miss Ellen Kay, of Bleak House, Ludworth. Among the presents were a silver cake basket and a biscuit barrel from the bridegroom's colleagues in the above department.

St. Helens T.C. has increased the salary of Mr. H. C. DUNCAN, commercial assistant at the electricity works, to £150 per annum, and that of Mr. B. T. HAWKINS, electricity station superintendent, to £200.

Peterborough T.C. has applied to the War Badge Department of the Ministry of Munitions for war badges for the following members of the electricity works staff, whose services are considered indispensable for the proper operation of the generating station:—Mr. T. ROWLAND, chief engineer; Mr. R. ROWLAND, mains superintendent; and Messrs. W. MILLINGTON, J. PRESCOTT, and S. POOLE, shift engineers.

Mr. C. W. SHEPHERD has resigned the position of general manager of the Edinburgh and District Tramway Co. The board have accepted the resignation, and asked him to continue his services as secretary. Mr. J. D. R. COX, of Messrs. Babcock & Wilcox, has been appointed general manager and engineer to the company. Mr. Shepherd has been in indifferent health for some time. He has been associated with tramway work for 32 years.

Reading T.C. has refused the general manager and engineer of the tramways leave of absence for immediate military service, but has raised no objection to his presenting himself for attestation in Section B of the Army Reserve.

At the Leeds City Council last week considerable discussion took place with reference to the recommendation of the Electricity Committee that the salary of Mr. C. N. HERRON, manager of the electricity department, should be increased from £900 to £950 per annum. Mr. Hugh Lupton pointed out that Mr. Herford was appointed on probation three years ago on the understanding that if he did his work well he would receive a salary commensurate with the duties of his office. Mr. Herford's predecessor received £900, and had afterwards received £1,000 at Liverpool, and this had later been increased to £1,500. An amendment was moved that the increase should not take place until the termination of the war, but this was defeated by 32 votes to 19, and the original recommendation was carried.

Mr. HAMPTON E. BLACKISTON, district mains and sub-station engineer, South Wales Electrical Power Distribution Co. (formerly of the Cleveland & Durham Electric Light & Power Co., Nuneaton Corporation, etc.), was recently married to Olive Isabel, eldest daughter of Mr. and Mrs. A. J. Siedle, of Streatham.

General.—Mr. EDWARD VICKERS, for 14 years chief electrical engineer to Messrs. Walter Locke & Co., Ltd., of Calcutta, has returned to this country, and now represents Messrs. Luke, Stonebridge & Co., Ltd., electrical engineers and contractors, of Calcutta and Lahore. Manufacturers of electrical apparatus are invited to address him at Pinley Green, Warwick.

Mr. J. G. MENEER, late chief electrician at South Crotty Mines, Poole (Cornwall), who some time ago joined the Royal Flying Corps, has been promoted to the rank of first-class air-mechanic. He is at present at Farnborough.

It is announced that Professor W. H. PERKIN, F.R.S. (son of the late Sir Wm. Perkin), Professor of Chemistry at the University of Oxford, has accepted the post of head of the Research Department of British Dyes, Ltd., and the chairmanship of the advisory council of that company.

Mr. P. J. PYBUS, M.I.E.E., has been appointed by the Bradford Education Committee as external examiner in electrical engineering for the final examinations for the Technical College Diplomas and for the Technological Exhibitions, and Prof. W. H. WATKINSON, M.I.E.E., and Mr. JAMES WATSON, M.Inst.C.E., have been appointed external examiners in mechanical and civil engineering respectively.

In the ballot list for the next meeting of the Institution of Mechanical Engineers, the Rt. Hon. LORD MONTAGU OF BEAULIEU is nominated for election as an Associate. His Lordship's marvellous escape from drowning after the Hunnish attack on the *Persia* has spared for the roll of this engineering institution the name of one whose services have been as brilliant as the title that he bears is exalted.

Roll of Honour.—Regt. Sergt.-Major JAMES GILL, of the 23rd Battalion Rifle Brigade, who has been presented by the N.C.O.'s with a sword, held a position in the traffic department of the Blackpool Corporation tramways system prior to rejoining the Army.

Trooper LEONARD C. BUTTERWORTH, of Chadderton, aged 20, who has been killed in France, was an electrical meter tester in the employ of Messrs. Ferranti prior to the war.

Private JAS. L. HORNE, of the 1/6th Battalion Manchester Regiment, who was, prior to the war, engaged as an electrical engineer at Manchester, is reported killed in action, after being missing at the Dardanelles for some months.

Lieutenant H. C. JONES, of the 3rd (Toronto) Battalion, 1st Canadian Division, who has died in hospital in London from wounds received in action, was formerly with Messrs. Stothert and Pitt, engineers, of Bath.

Private SAMUEL HAMER, of Monton, who has been on active service with the 16th Lancashire Fusiliers, is reported killed in action. He was 26 years of age, and, prior to the war, was employed at the British Westinghouse works at Trafford Park.

Corporal C. M. DEAN, of the 7th South Lancashire Regiment, formerly employed at the British Westinghouse Works, Trafford Park and at the Peel-Conner Telephone Works, Salford, has died from wounds received in action.

Lieutenant NORMAN COUTIE LOWSON, Royal Engineers, Special Reserve, 7th Division, a son of Mr. James Lowson, senior partner of Messrs. W. C. Martin & Co., electrical engineers, Glasgow, has been twice mentioned in dispatches during the past six months, first for distinguished service in the field at the battle of Neuve Chapelle, and now more particularly in relation to the fight at Loos.

Obituary.—Mr. RICHARD GRIGG.—We deeply regret to learn of the sudden death at Ottawa of Mr. Richard Grigg, Commissioner of Commerce in the Canadian Trades and Commerce Department, with whose reports on Canadian trade, prepared several years ago, our readers are familiar. Mr. Grigg was a native of Plymouth, and in 1907 was chosen to be head of the British Intelligence Service in Canada.

Mr. A. ILO.—The *Times* states that Mr. Alfred Ilo, the engineer and confidential counsellor of the Emperor Menelik, has died at Zurich at the age of 62. He went to Abyssinia in 1878 to superintend the construction of roads, bridges, fortifications, telegraphs, etc.

Mr. JOHN CAMERON SWAN.—The death has just occurred of Mr. John Cameron Swan, elder brother of the late Sir J. Wilson Swan. Mr. Swan was 89 years of age, and he is described as a prominent figure in Newcastle business and scientific circles for half a century. He was well known in the chemical trade as a manufacturer and merchant, and he had also been closely identified with manganese and other mining operations.

Will.—The late Prof. R. MELDOLA, F.R.S., left £93,767 net personality.

CITY NOTES.

Anglo-American Telegraph Co., Ltd.—The following dividends are announced to the close of the year, 1915, viz.:—A balance dividend of £1 10s. per cent. upon the ordinary consolidated stock for the year, less income-tax at 2s. 11d. in the £; a balance dividend of £1 10s. per cent. upon the

preference stock for the year, less income-tax at 3s. 2d. in the £, a first and final dividend of £1 10s. per cent. upon the deferred stock for the year, less income-tax at 2s. 8d. in the £. These dividends are payable on February 1st, and, together with those already paid, they will amount to £3 15s. per cent. on the ordinary consolidated stock, £6 per cent. on the preferred stock, and £1 10s. per cent. on the deferred stock for the year 1915. A bonus of 1s. 9d. per cent. is to be paid on the undivided ordinary stock, and one of 3s. 6d. per cent. on the deferred stock, free of income-tax.

Buenos Aires Lacroze Tramways Co., Ltd.—The report for the year ended June 30th states that, notwithstanding the higher value of coal, the cost of which has risen 40 per cent., the percentage of working expenses has been lower owing to economy practised. The gross receipts amounted to \$6,100,652 m/n, a decrease of \$321,820. The working expenses were \$3,760,781 m/n, a decrease of \$222,882 m/n, leaving as net profits on working \$2,339,871 m/n.—*Financial Times*.

Dublin United Tramways (1896) Co., Ltd.—The directors have declared a dividend at the rate of 5 per cent. per annum on the ordinary shares for the past half-year. £5,000 has been placed to reserve and renewal fund, £18,000 allocated for renewal of rails, and £13,045 carried forward.

Direct United States Cable Co., Ltd.—An interim dividend of 2s. per share, less income-tax at 3s. 2d. in the £ (at the rate of 4 per cent. per annum), is announced for the quarter ending December 31st, 1915.

Greenwood and Batley, Ltd.—The directors report a profit balance of £47,226 to July, 1915, plus balance at credit at March 31st, 1915, £6,417, making £53,644. After placing sums to depreciation and reserve and paying the 7 per cent. cum. pref. dividend, a dividend is to be paid of 25s. per share on the fully-paid ordinary shares and of 12s. 6d. per share on the £5 paid ordinary shares, absorbing £23,738, leaving £7,906 to be carried forward.

STOCKS AND SHARES.

TUESDAY EVENING.

Stock Exchange markets are a little undecided. What rather unsettled the investment department was the issue, towards the end of last week, of French Treasury Bills of twelve months' currency, bearing interest of 5½ per cent., and so affording a yield of 6 per cent. on the money. This came as a further reminder of the urgency of the money question, and our own War Loan wavered, causing other sound stocks to lose some of their recent steadiness.

Taking 6 per cent. as the newly-established credit of the French Government, it will be noticed that a number of debenture stocks, and even preference shares, in our electrical price lists give a return of less than this on the money. Time was when French credit stood highest in the world, next to that of British Consols, but, judged by temporary quotations—and, after all, the comparison is on empirical grounds only—there are British industrials whose attractions in the eyes of the investor are greater than the bonds of our nearest ally.

The Home Railway market is rousing a little interest, though of the lethargic order in the forthcoming dividends, among the first of which will be that of the Metropolitan Railway, the announcement being due on January 27th. In the market, it is thought that the company will pay about the same as it did this time last year—namely, 1 per cent., which would make 1 per cent. for the year and afford a return of about 4 per cent. on the money. It is not supposed, of course, that the deferred dividend stock will come in for any distribution this time. The Surplus Lands will no doubt get their 2½ per cent., and the yield on this stock comes to 5½ per cent. on the money at the present price of 50.

An unkindly joke in the market is to the effect that District ordinary stock will get the same dividend as usual. Incidentally, it may be recalled that the last time that this stock received anything at all was in August, 1882. There is still a little business being done in East London ordinary, on the basis of 3½. Underground Electrics have been active, and the income bonds shot up another 2½ to 8½. For the £10 shares £2 was bid the other day, but the price tempted sellers and the shares have gone back a little to 38s. 9d.; while the "A" 1s. shares, after touching 6s. 9d., are 6d. up on the week at 6s. 6d. London and Suburban Tractions have been wanted at cheap prices, but did not come to market. There is nothing doing in London United Tramways 4 per cent. debenture stock, of which, however, there are buyers at 51 or thereabouts.

Anglo-American Telegraph deferred stock rose ½ on the declaration of the usual dividends, with an extra 1s. 9d. on the ordinary, giving 3s. 6d. to the deferred. This came as an unexpected surprise, while it underlines the suggestion made here on several occasions, namely, that the deferred stock is quite a good speculative investment of its class. The 6 per cent. preferred at par is also recommendable, from the point of view of security, but there is not much to go for in the way of probable appreciation in the price.

The Treasury is bidding 100½ for New York Telephone 4½ per cent. bonds, this price applying to the sterling issue. The

first price posted in the Stock Exchange was 103½, and there was a rush round to the Government Office to sell at this figure. The holders elaborately explained afterwards that they were neither surprised nor chagrined to find that the price of 103½ referred to dollar bonds only, and that 3 points had to be allowed in respect of the sterling issue. The Government bid was distinctly higher than that of the market, because the bonds were in offer at 100 last Thursday, while the Government offered 100½ on the full wing morning.

The Telegraph market as a whole is very steady. There is considerable scarcity of the Eastern descriptions; and while the jobbers are ready enough to quote prices, they smile rather pityingly when a broker comes to ask them to make a price in some of the various stocks with which they are not supplied. "We can buy of you," they say; "but we have none to sell." Marconi are strong on the anticipation that the company is about to issue a statement showing what payments the Government will make to the company for the use of its system since the outbreak of war.

Brazilian Traction shares are a dull spot in consequence of a relapse in the Rio exchange to under 1s. This question of exchange is worrying not a little some of the markets connected with Brazilian stocks, but others profess that it should be disregarded, inasmuch as the fluctuations are so frequently brought about merely by speculators on the other side of the Atlantic. Thus, of course, is likely enough; but, at the same time, a fall in the exchange does not encourage confidence in the holders of Brazilian securities. Mexican stocks and shares of various kinds are dull and depressed. British Columbia Electric Railway deferred stock is 5 points lower. The Anglo-Argentine Tramways group shows a disposition to droop, noticeable in small declines in the debenture stocks.

Metropolitan Electric ordinary went back ½ to 2½, but otherwise there are no changes in the list of home electricity shares. County of London change hands with a fair degree of frequency on the basis of 10; and in some of the others there are occasional bargains about the figures quoted in our price lists. Speaking generally, however, there is no fresh animation in this department. May we add an expression of great regret at the loss which the market has just sustained in the death of Mr. H. B. Mudie, a well-known member of the House, who, before the war broke out, used to deal in electric lighting shares. Outside the Stock Exchange, he was best known as one of the leading exponents of Esperanto; and the news of his death in France came as a shock to his wide circle of friends.

British Westinghouse preference constitute the outstanding feature in the manufacturing group. The price has spurred 5s. to 2½, and the company is said to be doing exceedingly well with its war contracts. A lively business has sprung up in the shares; while, on the other hand, the recent activity in British Aluminiums has somewhat subsided. Prices of other manufacturing shares keep firm, without attracting a great deal of attention, so greatly has public interest become absorbed at the present time in the market for rubber shares.

And the rubber market remains the most active in the Stock Exchange. The other day the price of the raw stuff reached 4s. 3½d. per lb., and the buoyancy increased until the animation was the appearance of a boom in miniature. Despite Treasury regulations, there has been a lot of speculation during the past few weeks; and probably there were a good many men in the market not greatly displeased to see the price of the raw material slip back to 4s. per lb., which induced a few sales of shares, enabling the recent sellers to replace their stock at more reasonable figures than those lately prevailing.

In the armament group, it is noticeable how Vickers have just lately overhauled Armstrongs and passed them in price, though the difference between them is still a matter of a few pence only. There is a certain amount of life in copper shares, and the market is a good one for the time being.

DIRECT-CURRENT MOTOR MAINTENANCE.

By S. LEES.

(Concluded from page 7.)

THE writer does not recommend the indiscriminate scouring of commutators, and, speaking from experience, would say that, given average conditions of working, and everything else being equal, the application of the cleaning block should rarely be necessary. If required very fine quality carborundum cloth, or glass paper (cloth, if obtainable), may be used in a wood holder correctly shaped to fit the circumference of the commutator circle. Both of the preceding operations should be followed by a faithful clean-up of the whole machine.

When replacing an armature, after overhaul, say, the mistake is often made of overlooking the presence of the bearing oil-rings, which not infrequently suffer damage before the cause thereof is even suspected. On reference to fig. 18, it is evident that this happens through the ring being in the position shown in the sketch previous to the insertion of the shaft. To obviate such an eventuality a simple rest device, of which two forms are shown at fig. 19, may be fitted with advantage. A prolific source of seized bearings is failure of the oil-ring to travel. This may happen from various causes, chiefly, shortage of oil in the bearing well, the effect of which is to produce "whirling" of the ring, which becomes lodged on the top side of the bush, as shown in fig. 20. The simple expedient of chamfering (correctly) the sides of the ring slot, will effectually prevent the ring from permanently leaving its slot.

Too little attention seems to be given to the proper design of oiling rings. The common flat section type is bad, as it

FIGS. 18 AND 19.

has a great tendency to stick or become sluggish when working, especially with a heavy-bodied oil. A flat ring of the form represented at fig. 22 almost invariably hugs one side or the other of the ring slot. This is due to the greater capillary effect which is produced at this point than at any other part of the exposed shaft, the cause being the "pull" exerted by the captive film of lubricant already existent between the walls of the bearing shell (edges) and the shaft. The rising ring, coated with oil, is thereby attracted, the result being that the ring hugs or drags along the side of the slot, its rate of travelling being considerably below that which it would otherwise attain were the ring free from the retarding influence above described. Sometimes the ring will stop altogether, and in consequence the bearing heats up, and if allowed to continue thus, seizure follows. With oils which have an oxidising tendency a ring of this type may become stuck so fast as to refuse to move when the machine is started. A well-designed ring should be formed in one truly circular piece without detachable joints of any kind, and possess little inertia beyond that necessary to overcome the tendency to "whirl" or whirl. At high rotative speeds a ring which is too light churns or breaks up the surface of the oil and creates "creeping" and throwing along the shaft, and increases loss caused by evaporation, but, what is most serious of all, the errant ring conveys little or no oil to the shaft.

Various forms of chain had formerly some vogue, but the chain has many inherent disadvantages, and nowadays it is seldom used except on slow-moving machinery. To ensure an uninterrupted supply of oil the ring should sweep through a path unobstructed by metal projections, and easily clear the bottom and sides of the bearing oil-well. Two good forms of ring are shown in section at fig. 21. A perforated ring (fig. 23) has greater holding capacity than a plain one, but with the former there is a tendency to "drag," especially with the heavy classes of oils. The writer has often wondered why so many makers still persist in turning out motors having bearings fitted with hinged or flap-doors opening outwards. Such a fitting, especially at the driving side, may easily prove a source of danger

FIG. 20.

with the overhanging pulleys now so commonly used, and in dusty situations dirt accumulates on the lid, and when oiling time comes round, the bulk of the dirty matter oftener than not gets tipped into the bearing well. (This criticism is not meant as an advocacy for the poky unget-atable order of bearing; by all means have bearings accessible, but at the same time reduce the possibility of entry of injurious matter to a minimum.) Oil openings or inspection apertures covered with large single-hinged lids or doors are bad practice, except, perhaps, for machines working under engine-room conditions. Adequate means should always be provided for thoroughly draining bearing oil-wells, and it is a wise precaution when cleaning out a dirty bearing to give the interior of the well a good flush out with paraffin before refilling with clean oil.

In some designs, the oil from the bearings insinuates itself inside the motor casing owing to the size of hole through which the shaft passes being unnecessarily large. A thick leather ring sandwiched between a couple of felt washers will effectually prevent this trouble, the device being fitted to the inside of the motor casing. Oil-thrower rings should always be so arranged as to come inside the bearing housing.

FIG. 21. FIG. 22. FIG. 23.

FIG. 24.

Opinions differ considerably as to what is the best and most efficient form of ring, but a plain V section collar slipped on the shaft makes a very satisfactory and reliable device for this purpose; it has, also, the merit of simplicity, which is more than can be said of the many weird contraptions one frequently comes across. The practice of grooving the shaft itself, thread-fashion, is a foolish fetish, and, moreover, it does not prevent oil creeping.

With new machines the importance of clean bearings cannot be over-estimated. It is rarely indeed that intricate

cored castings leave the shop entirely free from traces, at least, of moulding sand or other gritty substances. In addition to pickling and fettling, the usual practice of painting by brush does not always ensure the "fixing" of any sandy matter which may be lurking in, say, some rugged corner or unsuspected blow-hole. A better plan is to pour a sufficient quantity of *suitable* paint in the bearing-well, and after thoroughly swilling around, run off any surplus which may remain. The writer has had his quota of experience of bearing troubles arising directly from the presence of moulding sand. It is fairly well known that, whereas an ordinary ring-fed bearing will often work quite well for long periods even in the presence of gritty matter, a ball-bearing would be ruined probably very quickly; hence the advisability of seeing that such bearings are quite above suspicion before the machine so fitted is started.

Moulding sand, however, is not always to be blamed for seized bearings—on new machines, at any rate. A handful of clean waste, of average shop quality, often holds in suspension enough gritty and other foreign matter to cause not a little alarm to the intelligent and conscientious user. Again, the precaution of cleaning out thoroughly new bearings *on site* is not always appreciated properly. Almost invariably, after a machine has passed test, and previous to packing, the bearings are emptied of lubricant, but seldom indeed is provision made for exclusion of dust or dirt during transit to the customer. In shipping on and off rail, in slings, &c., there are a score of different ways in which dirt, mud, and the like will, often unavoidably, become deposited in the bearings. The inside walls being more or less sticky the dirt adheres thereto, on flypaper principle, and if too much is taken for granted because the machine tested out satisfactorily, trouble sooner or later ensues; naturally, gritty matter is found, and a qualitative observation pronounces foundry sand, whereas, as likely as not, the disturbing cause will have had a more prosaic origin, probably a scraping of mud from a careless slinger's boot.

For obvious reasons some form or other of cable lug or thimble should always be used even for the smallest size of stranded cable. A good pattern of mechanical terminal device (proprietary) is on the market, which provides an efficient and neat attachment, especially for flexible cording; with the latter, efficient soldering is often a somewhat difficult matter where shop facilities are not obtainable. For heavy service the lug or thimble socket should always have at least one set-screw provided, not merely as a precautionary measure, but to ensure rigidity between cable and socket during the sweating operation.

A coat of white paint or enamel on the inside of a motor-shell is often of advantage, as it facilitates cleaning and elucidation of connections, especially where motors are located in dark and out-of-the-way places. As an aid to cleaning, a portable air-compressor is practically indispensable; and there are objections to the employment of hand-bellows or syringes.

In conclusion, by far the majority of electrical accidents occur through carelessness or neglect to take proper precautions in working. For instance, a properly-shaped screw-driver is somewhat of a rarity, and many mishaps have been caused through using an ill-shaped driver. In fig. 24 are shown correct and incorrect ways of forming a screw driver nose. It is well, too, to remember that there is a limit to the versatility of the otherwise useful cutters. A stock of suitable insulated spanners is a good investment, and a pair of thin skin insulating gloves should never be despised, as they provide, at any rate, an excellent insurance against undesirable eventualities; and this rather special class of risk is not, as yet, comprehended in the now common insurance coupon-policy of the daily news-sheet.

AMERICAN ELECTRIC COOKING CONDITIONS.

AN instructive report on the subject of electric cooking conditions in the Western States was presented at the Portland Convention of the N.W. Electric Light and Power Association, in September last. In the area to which the report refers there are 389,842 domestic electric lighting consumers, of whom 220,042 are using gas for fuel, and 2,481 electricity, leaving 167,319 homes which use some other form of fuel, and the authors consider ways and means of securing a large proportion of the latter as electric cooking consumers in the next few years.

The figures are interesting, as showing the approximate scope of future business in the area considered, also because it is evidently felt to be either unnecessary or undesirable to compete with the existing gas cooker business.

No doubt a similar feeling exists in many of our own cities, where the dual interests of gas and electricity are under municipal control, but the fact remains that in this country the gas cooker has monopolised this class of business for so many years, and so effectively penetrated into the houses of practically every class of consumer, that electric cooking must necessarily be—and even now is, in a small way—in competition with gas cooking here.

Much has been written and spoken in this country on the huge possibilities of the electric cooking load, but we doubt whether any British central station engineer possesses reliable data as to the existing cooking methods employed in his area, or, for the matter of that, as to the type of cooking employed by his own electric lighting consumers.

To return to the report: many of its conclusions cover ground familiar to our readers, as, for instance, the belief expressed that the ultimate residential rate will be one with a fairly high minimum bill, thus allowing the central station to furnish supply through one meter.

But the average American consumer must be blessed with a singular amount of patience and understanding if the typical rate cited of the Buffalo General Electric Co. is a sample of future tariffs, and for our part, we prefer the several types of "domestic" tariff adopted in this country, with all their oft-criticised shortcomings.

The Buffalo rate is as follows:—

8 c. per kw.-hour for first 60 hours' average monthly use of maximum demand.

5 c. per kw.-hour for next 120 hours.

1½ c. per kw.-hour in excess of 180 hours.

N.B. maximum demand figured less than 250 watts. Maximum demand taken as 25 per cent. of total installation, not including irons, heating devices, cooking devices, fans, vacuum cleaners, and utility motors, not exceeding ½ h.p. in size.

Discount 1 c. per kw.-hour on primary rate. \$1 minimum.

The subject of tariff making in its relation to the consumer and central station is an old story with us, and it is unlikely that we shall learn anything from our American friends in this respect.

Every tariff is in effect a compromise between the rival demands of a particular class of consumer and the central station; to attempt to individualise charges, in fact, to "make the punishment fit the crime," literally, as some people desire, is usually to court failure, for the true criterion of success in tariff making is the ultimate effect on the central station of the consumers *en masse*, and the tariff which is sufficiently involved to study the idiosyncrasies of the individual is too complicated for commercial use in this country.

It is considered in the report that electric cooking business can be secured with energy at 1½d. per unit, because of its inherent advantages and the less shrinkage of electrically-cooked foods, and many consumers using this rate insist that their monthly bills are, no greater than when cooking with gas—presumably costing from 3s. to 4s. per 1,000 ft.; investigators who are also interested in the gas business, however, believe that electricity at 1d. per unit more nearly equals gas at the prices mentioned.

For heating water a rate of 4d. to 5d. per unit is considered necessary, though unprofitable and only justified because it may lead to the securing of the cooking load at a higher rate. The idea is to use low wattage heaters connected during the night or all day, except when the range is in use.

To Develop Spanish Industries.—The Spanish Society for Promoting National Industries (El Fomento del Trabajo Nacional) is offering a prize of £200 for any new invention, process or improvement in the departments of electrical or mechanical engineering tending to the progress and advancement of the country's industries. Particulars of the offer may, we understand, be obtained from the Secretariat del Fomento, 4 Plaza Santa Anna, Madrid.

On the subject of competition with gas, the views of the combination gas and electric men, set forth by one of them, should be appreciated on this side.

As to the reasons why there are very few consumers cooking with electricity, even where the 1d. electric rate is given in competition with a gas rate of 5s. 3d. (\$1.25) a thousand cb. ft., he points out that the most important is "that people have become accustomed to cooking with gas and are equipped with gas stoves, water heaters, and other devices, and do not like to change from something they know to be satisfactory to something that is in an experimental stage." Again, the first cost of an electric range is cited as another drawback, and such apparatus is unlikely to be adopted, he considers, until the price is lowered considerably. A further reason given is the lack of an electric water heater which is as satisfactory as the gas water heater. Hot water being a household necessity and mixed apparatus being undesirable, he believes that cooking by electricity will be restricted until the right pattern of water heater is introduced.

As regards the first two reasons given, we may as well realise that the gas cooking habit in this country is due in great part to the low cost at which the consumer can obtain the necessary apparatus, which can be hired on most reasonable terms in the great majority of cases—terms so low, indeed, that one suspects future gas consumption bears a proportion of capital charges.*

The price of electrical cooking apparatus, on the other hand, is such as to effectively deter its general adoption, so that no body of public opinion in its favour is likely to result for sometime—although the number of individual opinions, very favourable to electric cooking, is growing rapidly. However, the gas-electric official goes on to admit that:—

There are certain obvious advantages in cooking with electricity, as compared to cooking with gas, such as greater cleanliness in the use of electricity, the fact that electricity does not burn up any of the oxygen in the room, thus making an electric kitchen a healthier place in which to work, and possibly more important than either of the above, it has been found by actual test that food cooked by electricity contains more of the original weight than when cooked by gas. In some cases the saving amounts to from 15 per cent. to 25 per cent. of the original weight. As an instance in broiling a steak the gas flame consumes considerable of the juice which has a very high nutritive value; with the electric broiler the juice is all saved, as there is no flame. With electricity the heating is under absolute control and exactly the right temperature can be maintained for any operation; with gas, no matter how careful the cook may be, there is bound to be considerable variation and the same condition of heat cannot be assured on all occasions.

He concludes that the gas business in general will not be hurt, but will be improved as electricity becomes more of a competitor, and with this the authors of the report agree.

In discussing "selling policy," the report advocates the necessity of the central stations doing the bulk of the selling of apparatus under present price conditions; that deferred payments should be allowed; and that costs of wiring should be averaged and included in the contract for the installation, although, as an introductory argument, it is suggested that the stations may find it advisable to absorb the wiring cost.

It is probable that before any great advance can be made in the adoption of electric cooking in this country, a co-operative movement on the part of the central stations for the purchase of apparatus will have to be introduced, with a view partly to introducing a degree of standardisation in apparatus, and discarding any special features which experience with gas cookers has shown to be quite unnecessary, and which consumers are unwilling to pay for, and partly to guaranteeing the manufacturers' output in return for such a reduction in price as will enable competitive hiring rates to be offered.

* A recent *Gas World* analysis of a number of gas undertakings for the year 1914-15 shows average receipts from stoves and fittings—presumably from hire, hire-purchase, &c.—amounting to 12d. per 1,000 cb. ft. sold, against average maintenance costs amounting to 12s. 6d. per 1,000 cb. ft. sold.

Bradford is credited with receipts amounting to £917 and maintenance costs of £4,474; Salford, receipts £1,225, maintenance £9,531; Coventry, receipts £1,960, maintenance £4,842; Darlington, receipts £1,934, maintenance £3,246.

We do not, of course, know what proportions cooking apparatus bears to the total, but the principal underlying these transactions can be understood.

In a leaderette bearing on this matter, the *Journal of Electricity, Power and Gas*, which also abstracts the report, says that "before any great increase in sales can be expected . . . the cost of electric ranges should be materially reduced. This should be possible with standardisation of design, just as has been done in the case of vacuum cleaners, which sell for less than one-fourth the price quoted five years ago, and is being done in the case of electric washing machines."

We entirely agree with our contemporary as to the necessity of introducing some degree of standardisation as between the various makers of cooking apparatus, although the subject is beset with greater difficulty here, where things are made to last years, than in the States where very often "a short life and a merry one" appears to be all that is asked for and provided for, and where, consequently, improved standards can be more frequently introduced.

The only solid argument against standardisation—on the score of its hindering the introduction of improvements—is worn somewhat threadbare in view of the fact that the most acceptable general type of apparatus has already been settled for us by our gas friends, to whom we should feel indebted rather than otherwise for having ascertained definitely just what will satisfy the average user of to-day.

If we can agree to so much, and it is apparent that a majority of the makers of electrical cooking apparatus do agree, in principle, then the problem is narrowed down practically to an agreement on one or two standard sized cookers, and the construction of electric heating devices within certain limiting dimensions, and having standard methods of attachment, and we doubt whether such restrictions, if it be conceded that they are commercially desirable, will hamper technical development to any undesirable or appreciable extent. Probably the reverse will be the case.

While it is well to keep the ideal always in view, our practical efforts will inevitably be influenced and severely limited by the prosaic question of what we can afford to supply at the market price, the latter being fixed for us, within certain limits, by economic considerations. Excellent as are the results obtained by electrical cooking, this factor cannot to any appreciable extent influence progress, because it is not realised by the public generally, and, indeed, cannot be until the apparatus is obtainable on somewhat similar terms to those offered with competitive apparatus. To paraphrase the historic recipe of a celebrated cookery-book, "To cook electrically, you must first get your stove."

THE CORROSION OF METALS.

A GENERAL discussion on "The Corrosion of Metals" formed the programme of the December meeting of the FARADAY SOCIETY. Sir Robert Hadfield, President, who introduced the subject, was in the chair, and papers were read by Dr. C. H. Desch, who dealt with the effect of the physical nature of metals on the process of corrosion, by the President, Dr. J. Newton Friend, Mr. Leslie Aitchison, and Mr. S. Whyte, on various aspects of the corrosion of iron and steel, and by Mr. Arnold Philip and Mr. W. E. Gibbs, on the corrosion of brass. Amongst those who contributed to the discussion following the reading of the set papers were Prof. H. C. H. Carpenter, Dr. W. Rosenheim, Dr. E. K. Rideal, Mr. U. R. Evans, Mr. L. Pendrith, Dr. T. M. Lowry, and Mr. A. F. Dismore.

Numerous examples of non-corrodible metals and alloys and of interesting specimens of corroded metals were exhibited by Sir Robert Hadfield and Dr. Friend, and Mr. Robert Lennox had an exhibit of a variety of articles made of his well-known non-corrodible ferro-alloy known as "Tantiron."

General Considerations on Corrosion.—The importance of the subject is manifest, whether on the ferrous or non-ferrous side. With regard to the former, it is estimated that the world's annual losses of iron due to corrosion amount to hundreds of thousands of tons. To reduce this to a minimum is to conserve our national stores of coal as well as iron, so that the invention of a cheap and workable non-corrodible iron or steel is a work of considerable national value. In the non-ferrous field the matter is no less important when we consider the constant corrosion always taking place in condenser tubes, economisers, feed-water heaters, propellers, and a hundred other things in contact with fluids. A concrete illustration of the cost of preventing corrosion in a particular case will be of interest. To protect the boilers of the *Lucitania* and the *Mauretania* from corrosion, 84 pure zinc plates, each weighing some 20 lb., were used in each boiler, and these were renewed four times a year. This meant an annual cost of £8,400 per ship, at the present price of zinc.

Dr. Rideal, in the course of the discussion, defined corrosion as resulting from an irreversible change proceeding with a small velocity and taking place on the common surfaces between two or more phases, the products of which change are continually removed from the sphere of action. Provided the word "phase" indicates physical state (e.g., state of strain or mode of crystallisation) as well as chemical composition, this definition suggests at once that corrosion is an electrolytic phenomenon, a result of numerous minute voltaic currents set up between the different "phases" on the surface of metals. This view would appear to be generally adopted, although, as will be seen later, there are differences of opinion as to what constitute the "phases" in the case of brass. As to the medium (or electrolyte on this theory), this may be the atmosphere, or some constituent of it, such as water vapour in pure air, or acid vapours in manufacturing towns, and special media such as gases in acid liquids. There is also corrosion by heating, but this is only a special condition of one or other of the above cases.

Methods of studying corrosion received a good deal of attention at the meeting. The ideal method is, of course, to test the material under normal working conditions, but this is too slow a process for ordinary purposes, and artificial corrosion has to be resorted to. In the case of iron or steel, simple immersion in water or acids has usually been adopted. In the case of brass, electrolytic corrosion—using the test piece as anode—in salt solution yielded instructive results, but it must never be forgotten that the results of a laboratory test must always be accepted with caution, unless it is certain that it imitates practical conditions. Another point strongly brought out in the discussion was the very different power of resistance to corrosion possessed by the same material under varying practical conditions. Thus an iron or a steel that will resist the Thames water has been found to be exceedingly corrodible in London air.

Another important aspect of the subject discussed, and it is often overlooked, was methods of measuring corrosion. Merely comparing losses of weight in laboratory experiments may be very misleading. It is necessary, as Dr. Desch pointed out, to distinguish the different forms in which the constituents are removed. The material, for example, may dissolve, the product of corrosion may be loose and flocculent, or adherent and protective; protective layers, indeed, of basic salts are quite an important factor in the resisting properties of metals. Again, corrosion may either take the form of pitting or of uniform surface action; obviously, a weight test in either case may lead one altogether astray. It is points such as these that render corrosion so difficult to investigate experimentally.

Corrosion of Iron and Steel.—Two main aspects were discussed, first, by Dr. Friend, the relative corrodibilities of iron and steel, and, secondly, by Sir Robert Hadfield and Mr. Aitchison, the influence on steel of the special additional metals now commonly employed—silicon, chromium, nickel, manganese, tungsten, vanadium, and others. Dr. Friend has come to the conclusion, and in this he was corroborated by some practical tests that Mr. L. Pendrith has been making, in conjunction with Mr. F. W. Harbord, that there is no simple answer to the question, which is the more corrodible, iron or steel? The answer depends both on the nature of the corroding medium and the standard of corrodibility to be adopted, and the problem really is, which is the best type of iron or steel for any particular purpose?

Sir Robert Hadfield's summary of the resisting properties of the steel alloys he has been working on for so long was most interesting. Confining ourselves to corrosion tests made in 50 per cent. sulphuric acid, it is noteworthy that the silicon and tungsten steels both have a minimum corrosive point, the former at 3.4 per cent. content, the latter at 2.2 per cent. On each side of these minima the rise in corrodibility is rapid. Nickel steels in this medium show a steady fall in corrodibility with increasing nickel content, while in the chromium steels there is a steady rise. These results show how important a factor is the corroding medium, for, in practice, nickel steels are not incorrodible, and although they often remain so until corrosion commences, they rapidly deteriorate after it has once set in. On the other hand, chromium steels in practice are highly resistive. As far back as 1892, Sir Robert Hadfield found that 10 per cent. chromium conferred on steel practical freedom from rust, and there is now on the market table cutlery made from what is known as "stainless" steel—because it does not tarnish in food or acids—containing from 10 to 12 per cent. chromium and 0.3 to 0.4 per cent. carbon. The mechanical properties of this steel, after suitable heat treatment, are also found to be excellent, and the possibility of using it for such purposes as dock gates is under consideration.

Mr. Aitchison's exhaustive experiments were in general agreement with those brought forward by Sir Robert Hadfield. The corrosion of steel in tap water, 3 per cent. sodium chloride and 1 per cent. sulphuric acid solution, increased with the addition of any third element up to about 5 per cent., with the exception of chromium, which conferred a permanent decrease of corrodibility (although it did not do so in 10 per cent. sulphuric acid). Generally speaking, high chromium steels were the only ones which showed to any real advantage over pure mild steels. The effect of varying amounts of carbon in pure steels was interesting, for it decreased the corrodibility up to about 0.5 per cent., increasing it above that point. This was significant, commented Dr. Rosenheim, for it was the second property of steel reaching a critical point at that carbon concentration. Mr. Aitchison subjected all his specimens, both before and after corrosion, to microscopic examination. It appeared that even in pearlite it was always the ferrite which was attacked, by the production first of etching pits, which spread gradually over the whole area. The carbide was always unattacked, and simply dropped away

mechanically, but it acts as an aid to corrosion, by providing a definite cathode for the ferrite or for any solid solution present acting as ferrite. Twinning increased corrodibility. It was strange that one of the least homogeneous of the materials examined—a 20 per cent. chromium steel—was corroded least. Mr. Aitchison considers that the true secret of non-corrodibility lies in some property of the solid solution—perhaps its solution pressure—which is to be found as a consequence of its chemical composition, coupled with heat and mechanical treatment. The solution pressure of iron itself is never low enough to prevent corrosion.

Mr. C. F. Dismore, in the course of the discussion, claimed to be able to convert cast-iron, with a high carbon content, into non-corrodible steel, by an electrolytic process which he had hit upon. This rather startling claim was received with a good deal of scepticism, and we must await further evidence before accepting it. If it were a mere skin effect it would be intelligible, but the claim went far beyond that.

The Corrosion of Brass.—In lieu of the usual theory that the corrosion of two-phase brass by sea-water is due to the action of electrolytic currents set up by minute couples of adjacent crystals of metals of different phase, Mr. Arnold Philip put forward for consideration the view that it is minute zinc-copper couples that act as voltaic cells. In auto-corrosion the current would flow from the zinc element, forming zinc chloride, to the copper forming caustic soda and depositing hydrogen. Thus polarisation will stop further action unless oxygen is present to counteract it. If it is, dezincification takes place, with separation or corrosion of copper. The theory is also shown to support the well-known fact that higher zinc content, such as in Muntz's metal, lowers the rate of corrosion, a fact otherwise difficult to explain, for a 70/30 brass is a single-phase, and 60/40 brass a two-phase system. Mr. Philip discussed at some length the cases of contact-corrosion and the corrosion of brass by external current, and he worked out expressions giving the relative magnitude of the action in those cases which, he said, agreed with observation.

Mr. Philip's theory was not kindly received. It was pointed out that if brass really were a mosaic of copper and zinc, corrosion would take place much more rapidly than it does. The evidence of the microscope and the equilibrium curve showed that the view that there is no chemical combination between the constituents of brass is quite untenable, and that it was highly improbable that zinc and copper could exist side by side in brass. Moreover, zinc in contact with copper should go into solution more easily than zinc alone, and the copper should not dissolve at all. This is not the case, and the E.M.F. of brass in sea-water resembled that of copper rather than zinc, while a mixture of brass and zinc, said Mr. Gibbs, had the same E.M.F. as pure zinc—a questionable statement, in our opinion. Mr. Gibbs himself, who, by the way, is at present acting as honorary investigator on the Corrosion Committee of the Institute of Metals, also, in his paper, dealt with the sea-water corrosion of 70/30 brass, and in this he arrived at the conclusion that a solid solution of zinc and copper is intermediate in character between a physical mixture and a chemical compound. There probably exists, he thought, a kind of "physical" combination in which the chemical character of the constituents is not changed, but only modified. Apart from its theoretical considerations, Mr. Gibbs's paper contained a great deal of valuable information on the influence of a number of important factors upon the rate and character of the corrosive attack of sea-water on brasses, and those interested are advised to refer to the original paper.

At the conclusion of the discussion, Mr. Elliott Cumberland gave a demonstration of his electrolytic process for preventing corrosion of all metals immersed in liquids. The method consisted in introducing a higher counter E.M.F. than that causing the corrosive action, and it has proved itself to be the only effective method of overcoming the dezincification of condenser tubes. Continuous current is supplied from a 10-volt dynamo to pieces of iron suspended in the liquids, which act as anodes, the cathode being the metal protected. The anodes last from 18 months to two years, and the cost of the current, too, is inconsiderable, on account of the low voltage. The system has been installed in many steamships with, it is stated, highly successful results.

TECHNICAL EDUCATION.

THE continuation of the war is by no means preventing the consideration in different belligerent countries of the important problem of the supply of skilled labour after the conclusion of peace and the indirect part which education at the present time should play in the production of future artisans and professional engineers. As a newspaper correspondent stated a week ago, the professions, like other lines of life, will then have been deprived of much valuable material, and the question now is to give a good education to those boys with whom the future of England lies. In this connection attention is again drawn to the county scholarships which assist boys on from stage to stage until they reach a university. But the war has made heavy calls upon the teaching profession, and further demands in this direction are in early prospect. It is for this reason that the important conference of teachers and others interested in education, including representatives of the County Councils' Association and numerous educational associations, recently adopted a resolution expressing the opinion that as the national prosperity at the close of the war will largely depend upon the supply of young citizens well trained for the full discharge of national obligations, no curtailment of the provision

of higher education should be made, evening school work should be continued, and the children of poor parents should be enabled to take advantage of such facilities by means of scholarships.

The question is also attracting attention in France and Germany. In the former country, although a scarcity of labour in general prevailed before the war and will become aggravated on its conclusion, most consideration appears for the moment to be devoted rather to the problem of the production of mechanical and electrical engineers than to the improvement of the training of youths, which is the more necessary, so as to form them into skilled workmen. In this connection M. J. H. Jacobsen, discussing recently the proposed development of the French electrical engineering industry, asked whether the manufacturer who was endeavouring to apply the methods of intensive production was sufficiently seconded by his staff and workmen. The reply given by this French engineer was a negative in general. He, however, apparently absolves the workmen from any blame from a technical point of view, because their education is incomplete, and their social difficulties prevent them from acquiring the requisite qualifications on their own account, but nothing is said in regard to the degree of their diligence. The course of workshop instruction and study, in his opinion, should not only be free of any expense to apprentices, but, as soon as they begin to show the least efficiency, they ought to be paid so as to permit them to carry their practical education to a conclusion. We will not follow M. Jacobsen in his observations in regard to the staff beyond mentioning that one of his ideas is that the manufacturers can help the staff and at the same time assist themselves, but will now turn to Germany, where an important pronouncement was recently made, not by an educationist, but by the general manager of the large engineering undertaking known as the Augsburg-Nuremberg Machinery Works, in a paper presented to the Association of German Engineers, on "The Engineer as a Promoter of National Education." As was mentioned in this journal several years ago, Germany was then over-flowing with highly-trained professional men of most classes, including engineers, and the only result at that time was the production of a superabundance of men for whom no profitable occupation was available. But the turn of these men apparently arrived with the preparation for and the course of the war. The idea of the general manager of the company in question now is that this process should be repeated on a grand scale for the whole of the country, so that every competent youth should become a highly educated and skilled workman, and that this form of education should be absolutely free. But let the general manager speak for himself:—

Dr. von Rieppel stated that German culture and civilization would lead the economic life of the country to further prosperity after the termination of the war. It was, however, necessary for that purpose that the former hatred between parties and classes should not blaze up again, but that the present unity should be permanently maintained. Apart from religious differences, the division in the nation in the past existed principally between workmen and employers, that is between two classes dependent upon each other, and between whom stood the engineers by reason of their profession. In his opinion the dividing antitheses were founded solely and only upon different conceptions of the duties and rights of citizenship of the individual in relation to the whole community. To need self-comprehension the young citizen, irrespective of whether he would be a future employer or workman, must first be instructed in these rights and duties and in the problems of a system of State. The schools, however, scarcely devoted any consideration to this side of education, and in the widest circles there was a lack of understanding as to its importance. Although the war would clear away many preferences and prejudices, it would not do so in such a fundamental manner as to maintain unity over the conceptions of the leaders of parties and classes after peace came. The problem would consequently remain for them as to how they as engineers, without occupying themselves with politics, could support in their own circles the efforts to mitigate the antagonism of classes in the sense and spirit of the rules of the Association. The author considered that that was possible if they restricted themselves to the education problems comprised in the matter, which he regarded as (1) the equal possibility of education for all classes of the nation; and (2) education in citizenship. As to the first point, Dr. von Rieppel remarked that the opinion was gaining ground that the sharp division between elementary schools and intermediate schools could not be permanently maintained. The premature transfer from the former school to the latter, which was now stipulated at the age of nine or 10, must be discontinued; an organic connection must be established between the two schools. But the school fees must be remitted in order to facilitate the attendance at school of talented children of poorer fellow-citizens. The German elementary school occupied the first position in regard to system and compulsory extension over the country. On the other hand, the American school, with its greater versatility and the greater incentive which was given to the children for higher education, was better for the great masses of the population. In particular, the American school was superior to the German in the sense that it formed the basis for each further study, everyone having the possibility of climbing to a higher stage. The premature transfer of pupils of middle class families to the classical school, which now took place in Germany at the tenth year, brought about a keen division in the great masses of the population, and it was all the more unfortunate as it was regarded as a privilege of wealth. This division had the further unfavourable influence of causing the better educated children of the higher classes of citizens to be excluded from intercourse with the lower classes of the population. The sharp antitheses which existed were, therefore, not

to be wondered at. The possibility only existed to an inadequate extent for the continued professional and citizenship education beyond the school obligation incidental to the elementary and continuation schools, whilst Germany occupied the last position in regard to public libraries. The nation had reached such a high degree of welfare that juvenile labour in industries was able to be entirely dispensed with up to the 14th year. But the higher grades of the national schools should be so improved that a transfer would be possible to the practical schools at the age of 14 without loss of time. This object could be achieved by slightly restraining the special instruction branches in the practical schools, and by advancing the instruction in the national schools. In this way, the German would obtain the equal of the American organisation by means of a kind of intermediate school. A large portion of the German classes of the population would thereby find the way open to higher aims still at an age when an opinion could be better formed as to the special talents of a child. If to this were added complete freedom of instruction in the national and practical schools or higher practical schools, a path in an upward direction would be opened to education in the lower layers of the population. This step, in the opinion of the author, would remove many grounds for dissatisfaction, and the attachment to the institutions of the State would be advanced. The particular German State which had the courage to establish an organic connection between the eight classes of national schools and the five classes of higher practical schools would be glorified for this action by the nation in future years.

It is impossible for us to follow at any length the observations made on the second point raised by the general manager. His argument, however, lies in the direction of showing that, after leaving the elementary schools for the continuation schools, the scholars should be instructed in the privileges, rights and obligations of citizenship, so that, instead of merely forming one-sided ideas on the subject and on the compulsory necessities of the economic life—fostered, as they are, by certain newspapers in the years intervening before they enter the army at the age of 20—they would fully understand both sides of the problem, and would become better citizens and better workmen. It is, therefore, contended that engineers and technical men in general should render assistance in the execution of this programme for the benefit of the community. Naturally, the scheme is merely a paper outline at the present time, although it has secured advocates in other circles. It would not, however, be surprising if something were done after the war generally to improve the technical education of the boys, quite apart from what will be accomplished, or is being carried out in connection with the education of soldiers partly disabled through the war. The Krupp Co., for instance, is already offering besides reinstating returned soldiers or re-employing them as far as possible—not for office work or as messenger, &c., but in the shops themselves—to grant financial assistance to competent men to attend classes in machine construction. We must therefore, not overlook what is proceeding in other countries in order that we may be better prepared on the conclusion of peace for the great industrial conflict of the future, than we were for the disastrous war of the present.

THE DESIGN OF HIGH-PRESSURE DISTRIBUTION SYSTEMS.

By J. R. BEARD, M.Sc., A.M.I.E.E.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS, December, 1915.)

(Concluded from page 30.)

Most Suitable Distribution Voltage.—In setting the distribution voltage the primary consideration is that it shall be sufficiently high to ensure that the voltage variation at the boundaries of the supply area can be kept within a reasonable amount without putting an excessive amount of copper in the feeders. It is usually desirable that the voltage variation should not exceed 5 per cent. either side of the normal, i.e., a total of 10 per cent., and from this about 2½ per cent. should be deducted for transformer voltage-drop, leaving a permissible maximum drop of 7½ per cent. in the high-pressure mains. Fig. 5 shows that under the same conditions the current density in the mains, and therefore the resistance voltage-drop per mile, is approximately independent of their section. The actual figures taken from fig. 5 are given in Table V.

As the power factor of most distribution systems is less than unity it is also necessary to take account of the inductive voltage-drop. This is not independent of the section, but given the current density from Table V and the frequency of the system it can be readily calculated from the size and spacing of the conductors. Fig. 9 shows, for several typical sizes of both underground and overhead mains at various voltages, the relative amount by which the inductive drop increases the total voltage-drop at various power factors. The calculations are based on a frequency of 50 cycles per second and on a constant current density, since the economical value for the latter is independent of the power factor. They also assume the use of ordinary 3-conductor mains; if

arranged for split-conductor protection the inductive drop would be appreciably reduced.

TABLE V.

Type of main.	Amperes per square inch at maximum load.		Resistance voltage drop between phases per mile at maximum load.	
	With the economical loading.	With the economical loading.	With the economical loading.	With the economical loading.
Underground mains up to 11,000 volts	910	635	68.1	47.5
20,000-volt underground mains	1,190	800	88.8	59.9
Overhead mains up to 20,000 volts	800	540	59.9	40.4

It is evident that the maximum radius of distribution and area of supply at a given voltage will vary according to the power factor of the system and to the various factors which determine the inductive drop, but in order to give an approximate idea of the relative figures for the maximum radius and area at various voltages the curves given in fig. 10

FIG. 9.—EFFECT OF INDUCTIVE DROP AT DIFFERENT POWER FACTORS FOR VARIOUS MAINS.

FIG. 10.—RADIUS AND AREA OF DISTRIBUTION AT VARIOUS VOLTAGES.

FIG. 11.—ANNUAL COST OF SWITCHGEAR PER PANEL.

have been prepared on the following assumptions:—Permissible voltage-drop, 7.5 per cent.; average power factor, 0.8; a network comprising equal lengths of underground and overhead mains; an average cross-section of main of 0.15 square inch; a frequency of 50.

It is interesting to note that, although it is more economical to run higher-voltage cable at an increased current density, the curves of both area and radius have still a steep upward tendency at 20,000 volts. This would be further accentuated if allowance were made for the fact that the average cross-section of main tends to decrease at higher voltages, with a corresponding decrease in the value of the inductive drop relative to the resistance drop.

FIG. 12A.—ECONOMICAL DISTRIBUTION VOLTAGE.

FIG. 12B.—UPPER AND LOWER LIMITS OF DISTRIBUTION VOLTAGE FOR 5 PER CENT. INCREASED COST OF DISTRIBUTION SYSTEM.

It is, however, not sufficient to settle the distribution voltage on the basis of permissible voltage-drop alone. It is also important to choose that voltage which gives the cheapest distribution system, and from this point of view it may often pay to use a voltage much higher than that which is required by the conditions of voltage-drop. Generally speaking, the higher loads which have to be dealt with, the higher is the economical voltage; but it is also necessary to

take into consideration the proportion between the total number of switches required and the total mileage of mains, as the cost of switchgear increases with the voltage. Fig. 11 gives fairly safe figures for the annual cost per switch at different voltages on the basis of annual charges of 8 per cent. on the switchgear and the corresponding building accommodation, and these figures have been used in the following investigation.

Taking a system comprising 24 sub-stations evenly spaced as in fig. 8 (a), and allowing an average of 24 switches per sub-station for controlling the step-down transformers, the total annual cost of switchgear and mains has been calculated for various distribution voltages and various sub-station loadings. In addition, the spacing of the sub-stations has also been varied so as to give several comparative proportions between the number of switches and the mileage of mains. From these results the series of curves given in fig. 12A have been plotted showing the most economical voltage under the varying conditions.

It will be seen by reference to fig. 6 that the annual costs of mains of varying sections lie approximately on straight lines, and it is therefore permissible, by plotting the curves in fig. 12A to a base of average demands, to make the results applicable to any arrangement of network whatever its type or extent. In order to find the most economical voltage for a given distribution of loads, the procedure would then be to

assume a voltage which it is anticipated will be about correct, to lay out the distribution system on this basis, calculate from this the average number of kilovolt-amperes per mile of main and the number of switches per mile of main, and then from these two figures find from the curves in fig. 12A what the most economical voltage would be. If the original voltage which had been assumed should prove to have been so incorrect that the arrangement of feeders and the number of switches would be appreciably altered by the adoption of the revised voltage, it may be desirable to lay out the system afresh with the revised voltage and afterwards check the results again with the curves in fig. 12A, the method being thus one of trial and error. As a rule, however, the first voltage assumed should be sufficiently close to the correct figure to enable the latter to be obtained by the first trial. The economical voltage obtained in this way must, of course, be always checked to ensure that it also meets the requirements of voltage-drop.

In order to give some idea of the extent to which the economical voltage can be departed from, the curves given in fig. 12B have also been calculated; these show the upper and lower limits of voltage corresponding to an increase of 5 per cent. in the cost of the distribution system. The limits are fairly wide, but, if they are exceeded, the extra cost of the distribution system increases at a cumulatively rapid rate. In practice it is advisable to adopt a voltage in the neighbourhood of the upper limit in order to keep down the voltage-drop as much as possible and also in order to make allowance for the increase in the density of load which will usually occur.

As might be expected, fig. 12 shows that the heavier the loads to be supplied and the more they are concentrated the higher is the most economical voltage. It should be noticed that the curves show no signs that at 20,000 volts the maximum economical voltage has been reached, provided the system loading is heavy enough, and hence for the larger systems of the future we may expect that for economical reasons alone the distribution voltage will be raised above 20,000 volts.

These calculations only refer to underground mains; with overhead mains the economical voltage will be higher, since there is so little difference between their cost at various voltages.

In order to see what are typical figures in actual practice for the number of switches per mile of main and the average number of kilovolt-amperes per mile of main, the following table has been prepared for two typical systems for which the author has had access to the necessary data, and as a matter of interest the corresponding economical and limiting values for the distribution voltage have been deduced from fig. 12.

TABLE VI.

System voltage actually adopted ...	5,500	20,000
Number of switches per mile of main ...	2.63	0.725
Average maximum kilovolt-amperes per mile of main ...	450	3,500
Most economical system voltage ...	5,700	16,000
Upper and lower limits for system voltages with 5 per cent. extra cost of distribution system	9,500 3,200	20,000 12,000

In conclusion, the author wishes to record his obligations to the Newcastle-upon-Tyne Electric Supply Co., Ltd., and associated power companies on the North-East Coast, and to their consulting engineers, Messrs. Merz & McLellan, for permission to use much of the data on which the conclusions of the paper are based.

SOME DIFFICULTIES IN THE DESIGN OF HIGH-SPEED GENERATORS.

Prof. A. B. FIELD'S paper on this subject was discussed by the MANCHESTER LOCAL SECTION of the INSTITUTION OF ELECTRICAL ENGINEERS on November 20th, 1915. An abstract of the paper was given in the ELECTRICAL REVIEW for December 3rd, 10th and 17th, 1915.

Prof. MILES WALKER assumed that the author did not advocate a departure from the solid type of rotor in cases where the stresses were not as high as in large machines run at very high speeds. The rotor winding shown in fig. 8 had been proved to be perfectly satisfactory to use in ordinary shop practice, but for large rotors dealing with many thousands of ampere turns per pole at high peripheral speeds, a better winding could be put forward. [Prof. Walker then described a winding, details of which were given in our report of the London discussion.] The plan of getting the stator coils a long way back from the rotor was very good. If the slots were made 3 or 4 in. deeper than at present, it would be possible to get quite a wide space between stator and rotor coils; this permitted of sufficient leakage flux to cut down the stator current on short circuit and obviated the necessity of providing an expensive reactance coil, which caused a certain amount of loss. The extra depth of slot provided a good cooling surface which could easily be cleaned. The general mechanical arrangement was much preferable to the type of machine where everything was bunched near the rotor with only ventilation behind—here they had the ventilation in front on the rotor side.

Mr. F. A. KUYSER described a system of ventilation which eliminated some of the objectionable features of axially ventilated machines. In the case of an 8,000-k.v.a. 2,400-R.P.M. machine, axial vent chambers were provided in the usual way by means of holes punched in the core laminations. Nine radial air ducts, each $\frac{3}{4}$ in. wide, were provided instead of one central duct. Each axial duct was, therefore, divided into ten equal sections, which were connected together by means of a system of axial tubes welded to the ventilation spacers. At certain places the connecting tubes were left out and semi-circular distance pieces used which allowed the air to escape from the axial ducts to the radial ducts. The air outlets were evenly distributed over the whole length of the core, an equal number of axial ducts delivering to each radial duct. In addition to the elimination of the large central discharge, another advantage could be obtained by arranging the air streams to secure a counter-flow action, the air streams in adjacent ducts having opposite directions of flow. This arrangement reduced the high temperature which occurred near the air outlet of axially ventilated machines and equalised the temperature over the whole length of the core. In connection with stator coil bracing and the type of armature winding for turbo-generators, the diamond type of winding illustrated in the paper had been extensively used in the United States. A disadvantage of this winding was the open slots, which introduced extra losses; if wide slots were used, magnetic wedges were absolutely essential. Concentric winding had the advantage that each bar could easily be replaced without disturbing the remainder, but, generally speaking, a breakdown necessitated complete rewinding. The semi-closed slots were also of advantage. Referring to rotor coil bracing, he gave an example of a 15,000-k.v.a. 1,500-R.P.M. 2-pole machine having a radial forged rotor of 46 in. diameter weighing 22 tons. The torque developed on short-circuit was, roughly, 15 times normal, and this produced a force of 15 lb. acting on each lb. of copper. The maximum deflection of the winding, which was 14-in. width copper, was .015 in. If only the fly-wheel effect of the turbo was taken into

account the deflection was .008 in. These figures suggested that a substantial field strap would suffice to prevent damage after a short-circuit without extra bracing, and this was verified in actual tests on machines of 15,000 kw.

Mr. G. D. SEATON said there was no less than 100,000 k.w. of high-speed generating machinery out of commission in this country. The speed did not seem to be the source of trouble, as in almost every case it was the stator that proved defective.

Mr. JUHLIN said the author's figure of 20,000 lb. for the stress inside the rotor was probably under rather than over the mark, and in order to secure the disks on a through shaft it was necessary to shrink them on with stresses considerably above the running stresses. It was also required that the disks should fit the shaft when running at maximum speed; otherwise the disks would float, which was not permissible. Fortunately, this country was well situated to obtain steel forgings of large and small sizes, and for that reason it was probably unnecessary to adopt a disk construction until very extreme sizes were encountered. British steel makers were prepared to supply very large rotors having excellent physical properties in both radial and tangential directions. American steel makers had not yet been able to guarantee such radial test pieces. The following details represented the procedure adopted by one of the leading British steel makers in the manufacture of large rotors:—An ingot of approximately 115 tons and 94 in. in diameter would be issued, 50 per cent. being cut off at the top end to ensure homogeneity of material. A 12,000-ton press would forge the ingot down to the required diameter, the ends being forged down in a smaller press. The reduction in area would then be about 2½ to 1, so that the work done was quite considerable. After rough machining the rotor would be thoroughly annealed, and in this process probably more was done to the quality of the steel than was generally appreciated. Regarding the internal stresses, which were very high unless the material was treated exceedingly carefully, it was to be noted that in the finished rotor there were radial ducts dividing the rotor into sections to a considerable depth, 6 to 8 in. These ducts would materially tend to release the stresses in the longitudinal direction. The slots for the coils and the ventilation ducts under the slots would to a certain extent release the stresses in the tangential direction, so that in the finished rotor the remaining initial stresses should be fairly well released. The critical speed could be calculated much more accurately in the case of the solid rotor, and the stiffness of construction permitted a smaller diameter for a given output, which would give a slightly better efficiency. It would also be possible to use self-contained blowers in many cases where, with the author's construction, the increased length would make it impossible. By placing the slip-rings outside the bearings, the distance between bearings was considerably reduced, and at the same time another objectionable feature, high peripheral speed, would be obviated; greater accessibility to slip-rings was also obtained. The ultimate cost of a rotor constructed of plates would probably be slightly less than the cost of the solid rotor.

Mr. A. E. MCKENZIE expressed appreciation of the 3-part wedge, and referred to the great difficulty of making a satisfactory job of a solid wedge perhaps 6 or 7 ft. long with the present high peripheral speeds giving a stress of about 1 ton per square inch at the surface of the key. Considerable trouble had been experienced owing to keys working loose, even after insertion with pressures of 20 to 25 tons per square inch. There were advantages undoubtedly in having external reactances, particularly when a fault developed on the windings adjacent to the machine terminals. In such a case, high internal reactance would be of little use in reducing the shock to the system. The Manchester electricity department had recently specified that all large machines should be built to withstand a short circuit at the main terminals, when running fully excited at normal speed, but under present conditions they hesitated to apply the test. He had recently inspected tenders for 15,000-kw. machines having the internal reactance so high that a short-circuit current value of only seven times the normal was obtained. He had seen several machines having windings of tubular or rectangular form to enable air to pass through the conductor. The cooling would undoubtedly be more effective in these designs than where the cooling air came into contact with only a small portion of the conductor periphery. The circular conductor was much better to insulate than the rectangular type, which tended to cause fracture at the corners. He had known of considerable trouble in the past with built-up rotors; the solid rotors had, however, given no trouble whatever, and he would be sorry to have to revert to the older types. Temperatures of 120 deg. C. to 180 deg. C. were only possible with mica-insulated machines.

Dr. G. W. WORRALL dealt with the use of fans on rotors, and advocated the use of external fans in nearly all cases; a better system of ventilation was obtained, and nothing was lost from the point of view of overall efficiency. Axial ventilation was preferable to radial ventilation, and ventilation systems should be arranged so that all air ducts could be thoroughly cleaned. He had experienced considerable trouble due to breakdown of end windings of rotors; it was almost impossible in building up machines to apply the actual pressures to windings which occurred in practice.

Mr. R. TOWNEND said that the type of rotor described by Prof. Walker had proved highly satisfactory. In all cases the temperature of the windings had been very low. Large

losses occurred due to eddy currents in different parts of a turbo-alternator, amounting to 2 per cent. or more of the normal output of the machine; if this eddy-current loss could be reduced by one-half the efficiency would be increased 1 per cent., together with a considerable reduction in heating. The subject of stray losses in turbo-alternators was deserving of thorough investigation.

Dr. W. CRAMP said the author had shown that the first general limitation was the frequency, and the second was the material available. He cordially approved of the use of the term "yield point" instead of "elastic limit" throughout the paper, but there was no indication of what the author considered to be a safe stress with respect to a given yield point, i.e., of the factor of safety employed. Another limit not mentioned in the paper beyond which any increase in peripheral speed might lead to uneconomical design was introduced by the fact that in a slotted rotor, when certain limiting densities were decided upon, there was a corresponding maximum slot area. The area of the slot multiplied by the space factor, by the specific weight of copper, by the square of the velocity, and divided by gR was a measure of the centrifugal force acting upon unit length of the tooth root. Equating this to the section of the tooth root multiplied by the safe stress corresponding to the material used would show whether the most economical design as dictated by electro-magnetic considerations was consistent with the peripheral speed and material proposed. He concluded that designers were approaching the limit when they would not have material which would carry the stress corresponding to the maximum copper which could be got into the slot. Regarding critical speed, he was quite in agreement with the author, but local designers did not take the same view. When he specified a turbo-alternator in which the critical speed was to be above the speed at which the machine ran, a well-known designer said there was no necessity for any such limit, as no one would pay for it. Presumably this attitude would now be abandoned. Regarding ventilation, the author showed preference for an axial passage under the winding slots with a radial discharge distributed over a fairly wide central portion of the rotor; many designers thought that pure axial ventilation was very much better when it could be accomplished. Regarding air-gap reluctance as affected by the stator slots, Mr. Carter's paper on "Airgap Induction" was a fine example of what might be carried out to a very much greater extent.

Mr. H. DUTTON, in a communication, described his experiences with some D.C. turbo-generators over a period of five years, and emphasised the necessity of perfect balancing at the operating speed. He deprecated short-circuiting tests, and pointed out that with step-up transformers between the generators and bus-bars, reactance coils appeared to be unnecessary.

The Author, in reply to Prof. Walker, said that the field winding described in the paper was not, in his opinion, the final solution of the problem; Prof. Walker's system had many advantages. A number of small slots were used, and by excellent cooling conditions a much shallower slot was permissible than in the system described in the paper. On the other hand, a number of small slots was a manufacturing disadvantage when dealing with heavy pieces. Mr. Kuyser's system of ventilation was interesting, but had the disadvantage of some blind-ended vents, with possible manufacturing difficulties. Mr. Kuyser had also referred to short-circuit tests on 2-pole 25-cycle machines; it was justifiable to take the risk of unbraced coils on 2-pole machines, but the risk appeared too great on 4-pole machines. Cases had occurred in which the shaft had been twisted, which gave some idea of the shock to the windings. In reply to Mr. Juhlin, ductility was required not at the thick part of the tooth, but at the root; wedges did not fit along their whole length, and at certain parts a tooth had to be stretched to throw the load upon another part, and so on. It was satisfactory to find steel makers in this country willing to accept orders subject to radial tests; steel makers in the States gave point-blank refusal. Bol joints in the rotor would show up by producing low critical speed. Outside slip-rings had many advantages, but the mechanical disadvantage of taking the leads through the shaft, in the author's opinion, more than counterbalanced the advantages. Regarding the costs, there was very little to choose between the solid and built-up rotor when complete. Replying to Mr. McKenzie, the author agreed that the advantages of air washing or filtration were enormous. Regarding hollow conductors, there were possibilities in the case of turbo-windings; many years ago such windings were used on transformers in the Niagara district, water circulation being used in the low-pressure windings. Some movement of rotor windings certainly did take place, but as it was slight it was easily taken care of; he did not consider this motion the cause of the breakdown referred to by Dr. Worrall. He agreed with Mr. Townsend that the whole subject of short-circuit losses was greatly in need of investigation. In large machines the short-circuit losses were enormous, and their distribution was quite unknown. They were too big to be level, and were probably distributed all over the machine, otherwise the consequences would be more serious. In reply to Dr. Cramp regarding the factor of safety, the author said the machines were all tested at 20 per cent. over speed, and would hold together at 50 per cent. over speed. With reference to rotor slots, the tooth stresses were not a serious matter, since if they were a salient feature

nickel steel could be used without any great increase in cost. Mr. Carter's work seemed to show that in general the question of air-gap reluctance would be accurately enough determined in these machines; the question of rotor face losses, however, was obscure, and Mr. Carter's work did not cover the case.

NEW PATENTS APPLIED FOR, 1915.

(NOT YET PUBLISHED).

Compiled expressly for this journal by Messrs. W. P. THOMPSON & Co., Electrical Patent Agents, 25a, High Holborn, London, W.C., and at Liverpool and Bradford.

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE—4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AGREKA, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates—Per annum, postage inclusive, in Great Britain, £1 1s. 8d.; Canada, £1 8s. 10d. (\$3.80). To all other countries, £1 10s.

FOREIGN AGENTS:

ADLAIDE: Messrs. Atkinson & Co., Gresham Street.
AUCKLAND N.Z.: Gordon & Gotch, Albert Street; The Mining and Engineering Review, 31a, Strand Arcade, Queen Street.
BANGSANE: Gordon & Gotch, Queen St.
CHRISTCHURCH, N.Z.: Gordon & Gotch, Manchester Street.

WELLINGTON, N.Z.: Gordon & Gotch, Cuba Street.

MUCH has been said and written during the last fortnight about the attitude of Labour in this great crisis of the country's history. Complaint is made that trade union leaders do not represent the real feeling of the working man upon great national questions. In particular, it is urged that the card system of voting at Trade Union Congresses is misleading. Whether this is so or not, there can be no question that organised labour has manifested an unpleasant desire to act in its own interest rather than in the interest of the country.

Individual employers in the electrical industry—to take it as an example—will tell you that they know the vast majority of their men are loyal to the core. If the works manager is a "sahib" liked and respected by the employes of the firm, they will have unburdened themselves to him "on the q.t." He knows that once they are removed from the pernicious influence of the Socialist and the demagogue these men are fully prepared to make any sacrifice that may be necessary to win the war.

But, alas! The baneful influence of the so-called trade union leader still makes itself felt! After all, this kind of man lives by agitation. He is paid to agitate. Before the war he was paid to stir up strife between Capital and Labour or between class and class, and he earned his money. Let the working man realise that it is his paramount duty to put the interests of the country before the interests of his union and before his own selfish interest, and the power of the union to do evil is gone for ever.

Some of the demagogues who are largely responsible for the present attitude of Labour in the national crisis present a forlorn spectacle at the present time. As educated men, as men who have sown their political wild oats, they have begun to realise the harm which they have done in former years. In speeches made up and down the country they denounced Capital and extolled Labour. They asserted—and their assertion was cheered to the echo—that the rich were enemies of the poor. They coined phrases which helped to win elections for the Socialist. They managed to instil these doctrines into the mind of the working man as firmly as the doctrine *Deutschland über alles* was dinned into the children of the Fatherland. And now, since the great war began, they have seen the error of their ways. Some of them have sought, and are still seeking, to undo the past. They have seen that the rich men, whom they so roundly abused, have been willing to devote life and money to the service of the King, and profess themselves surprised and pained to find that the working classes will not do the same. But the teaching of the years is not to be so lightly discarded.

In a recent special supplement the *Times* dealt at some length with education and the war. It drew instructive comparisons between the systems of education adopted by the various Powers concerned in the conflict, and laid down certain principles which ought to guide us in the future.

There is one point upon which the English and German systems are as far asunder as the poles. In Germany, the child is taught from its very earliest years to think patriotically, to feel that for a man to lay down his life for his country is the finest thing on earth. In England, on the other hand, such a principle is seldom inculcated in the elementary school.

NOTICE.

IN view of the recent increase in the Postal Charges, our Subscription Rates for Great Britain and Canada will until further notice be increased to £1 1s. 8d. and £1 3s. 10d. respectively.

We would essay to take up this question of education in its relation to war where the *Times* left off, and ask ourselves these questions: Did our system of education do anything to prevent the present war? Has it qualified the people to take part in the war?

As it seems to us, it were idle to limit a discussion on education to a consideration of that which takes place in elementary schools. The education of the working classes goes on long after the "highest standard" has been attained. It is continued by the demagogue and the Socialist, whose one purpose is to foster the belief that the sole object of the working man is to look after himself and his own interest. And notwithstanding that a very large number of workmen have thrown over good jobs in order to join the Colours, there is no doubt that there is a very considerable number still lagging behind. Many of these belong to a type created by the Socialist—a type which might never have been allowed to come into existence if our educational system had been framed a little more upon the German plan.

When, therefore, it is said that the voice of Labour is against this or that proposal which eminent statesmen say is necessary to win the war, it were idle to ride off on the pretence that trade union leaders are wholly without the support of their following. While it is necessary to bear this in mind, we believe that when the state of affairs at home and abroad is seen in its proper light, the working man, if dealt with personally, will not be slow to make any sacrifice which the country may demand of him.

NATIONAL BUSINESS ORGANISATION.

SHORTLY after the outbreak of war a movement was set on foot to establish an Institute of Science and Industry. Some more or less hurried preliminary measures were taken with the object of organising British industrial methods, and particularly with the view to ensuring the proper application of scientific knowledge in the production of manufactures. Perhaps there was not all the calm deliberation devoted to the project in its early days that one would have desired. There was a preliminary luncheon; a preliminary scheme was drawn up in which the founding of a new trade journal better than all others formed an important part; a number of free articles were offered to the Press; a meeting was called at the Mansion House but the original time had to be altered, and other scientific conferences held on the same day clashed with the event, so that the audience was very limited; the name of the Institute underwent a change, and the details of the scheme also underwent alteration. On April 9th, 1915, we stated in these pages that for many years we had all been talking about the necessity for closer co-operation between science, industry and finance, and that the time had surely come for something in the way of action. Hardly was the ink dry when we received a communication from the Institute of Industry and Science which led us to hope for some definite action to be taken and its nature disclosed at a dinner which was to be given "in about a month's time to the leading industrialists, scientists, and bankers." Deliberation was no longer wanting. Since that date we have endeavoured to possess our souls in patience, but the announcement, like so much else, was very hurried, and we have had to wait nine months. That may not matter very much under the circumstances, but it would have mattered very much indeed if we had had to wait for it in order that the nation might have made any progress toward securing that greater scientific and industrial co-operation that we have all been so eager to ensure. At the end of nine months we are entertained to luncheon at the Savoy, are regaled with a further paper by the Chairman of the Institute (not a chapter from a published book

this time), and are permitted to enjoy a most excellent speech from Sir Edward Carson. For a revised and, we suppose, final statement of the objects that are to be pursued, we turn to the paper mentioned above, which would hardly be described as an after-dinner speech, but in the speech of Sir Edward Carson we find a timely reminder that many minds are at work along the same lines, and many movements are on foot. The six objects for which this Institute of Industry (of Great Britain and Ireland)—"Science" has now been dropped from the title—now stands will not be unfamiliar matters to readers of this and other technical and industrial journals; they are as follow:—

1. To secure the establishment of a Ministry of Industry with a properly qualified staff so that our foreign, Imperial and domestic commerce may be developed on the most modern and scientific lines.

2. To secure adequate Parliamentary representation in the House of Commons on behalf of national industry, finance, science and commerce, in order that a unified and practical policy may be adopted with regard to the development of National and Imperial industries, and that the disabilities under which manufacturers at present operate shall be removed.

3. To secure the establishment of an industrial bank or banks for the purpose of extending banking credits in so far as it affects industry in the development of home, Imperial and foreign trade.

4. To develop National and Imperial industries by the holding of annual exhibitions of the natural resources and industries of the United Kingdom, the Dominions, Colonies, and Possessions.

5. To stimulate and encourage standardisation in methods of production, organisation, and distribution. To promote and extend the application of scientific principles to industrial and general purposes. To invite the reading of papers and lectures on these subjects, and to communicate all such information to its members.

6. To stimulate and encourage the standardisation of our educational system. The demand of industry and commerce for the expert administrator and technologist must in the future become more exacting; the stability of our national industries, therefore, will depend upon the standard of knowledge prevailing in our factories and workshops. The Institute will co-operate with existing educational institutions, professional societies and trade organisations, in establishing a definite medium for the exchange of ideas between leaders of industry and education, whereby definite standards of courses of study and standards of attainment will be arrived at and mutually accepted as the guarantee of efficiency in each of the industrial professions.

Mr. J. Taylor Peddie described his Institute as being "in reality a British Economic League," and just as in the earlier days of hurry he found it necessary to reflect upon the Press of which he subsequently made use, so he now considered it politic to reflect upon other organisations created in the past for national purposes, few of which organisations, if any, had been able to give adequate expression to the needs of the hour. "They have a vague notion that something is wrong, but what it actually is they are unable to define." In the present case, however, "we have every reason to believe that we shall be able to carry them (the above six objects) into effect at an early date." But, it was added, "it entirely depends upon the support, financial and otherwise, which the British public, and particularly the manufacturers and trade organisations, are prepared to extend to us in support of our movement." Now, if these two statements mean anything they mean that the Institute of Industry has "every reason to believe" that the "manufacturers and trade organisations" will give such support to this particular movement, that we shall soon, through its instrumentality, have a Ministry of Industry, have engineering and scientific interests adequately represented in Parliament, have industrial banks established, have some big exhibitions, shall apply scientific principles to industrial purposes, incidentally hearing a few more papers on such matters, and shall standardise our educational system.

We have not space to spare to cover all the matters touched upon in the paper or address which, in our opinion, was altogether too lengthy, and too hurriedly prepared, for such an occasion, but when it is stated that the new Institute intends to co-operate with educational and

professional societies and with trade organisations, we are tempted, as an electrical and engineering journal, to ask whether any of our particular institutions or organisations have expressed their desire or willingness to "co-operate." We were informed that we could "best assist" by concentrating our energies "through one organisation entrusted with the task of developing the new National Business Policy." . . . "Assist us in that direction by not only becoming members of this organisation, but by persuading your friends also to join."

The Chairman at the luncheon, (Mr. F. J. Nettlefold), informed the two hundred gentlemen present that all of the immense burden of work from the beginning down to date in connection with the Institute had been done by Mr. Peddie, who was too modest to claim the credit for himself. We can quite understand that these and other matters with which that gentleman has been concerned during the past twelve months would be quite sufficient to tax the time and resources of any ordinary mortal, but if he lives to see the attainment of those six objects through the instrumentality of his Institute he will certainly have deserved imperishable glory.

Undoubtedly the feature of the gathering was the speech of Sir Edward Carson, who said that, judging by circulars he received from institutions and societies similar to their own, that were cropping up all around them, he came to the conclusion that many minds were now naturally busy looking with considerable anxiety to the commercial and financial future of the country and the Empire as the outcome of the war. Some of these, he said, would be mere mushroom societies, and he advised them, if they meant to be effective, to concentrate and not dissipate their forces. This anxiety he regarded as a very healthy sign. It meant that the country had made up its mind that the treasure of men and money which it was now expending should not be spent in vain, and that in framing the terms of peace, and in pursuing industrial and commercial policies after the war, we were resolved that we should purge our system of everything which was inimical to our own interests or could be used by the hostile foreigner as a weapon against us.

After a few other speeches, a resolution was carried in which those present fully endorsed and approved of the objects and policy of the Institute, and recommended "all persons or companies interested in the industrial life of the British Empire to support the Institute by becoming members."

There is a feeling that the time has come for a strong organisation of the whole engineering industries of the United Kingdom to be formed. We further have in existence our own electrical trade organisations, and these see the need for a federation of all associations of their class in order to bring combined influence to bear upon particular problems and in particular directions. Are we to understand that our firms should join the new Institute as well as, or instead of, their existing trade organisations? Or will those existing trade organisations meet the individual member's case by entering into "co-operation" with the Institute? We have no doubt that the various organisations will judge for themselves whether the Institute of Industry (of Great Britain and Ireland, Ltd.), deserving and ambitious as its objects are, is the organisation through which they will elect to "federate." Because some things may have been done in a hurry, the importance of the objects of the scheme is not affected, but the interests of engineering and electrical industries are too great for them to be subordinated to other interests.

Rubber.

THE rubber market has had a wildly exciting time lately, but there has been some reaction from the best figures, and there is no doubt whatever that a good deal of the buoyancy was due

to the initiation of speculative operations which do not deserve to be encouraged at this juncture. If this sort of thing goes on there will probably be Government intervention, as there has been in some other essentials for the successful conduct of the war, and the speculative confraternity might do worse than take this to heart. Rampant speculation is wholly out of place in these times of strain and stress. There has been a good deal of forward buying, and premiums have been easily obtained for February-March contracts. It is very difficult to obtain material from vessels arriving owing to the shocking state of congestion which still exists at the docks, and under all the circumstances it is hard to form an opinion regarding the future course of values. The reaction witnessed in prices has certainly been a good thing for the trade. There has been too much speculation going on everywhere, but there will always be people eager to take advantage of the difficulties of their country in order to make money for themselves, and it would be an excellent thing if this could be put down with a strong hand. There seems no warranty at present for anticipating any shortage of material, and, this being the case, there is no substantial justification for the rushing up of prices. The prospect points indeed to ever-increasing quantities of rubber becoming available, and it is the more remarkable, therefore, that the tendency of forward shipments should have been stronger even than that of prompt supplies. The world's demand will probably keep pace, under normal circumstances, with progressive output, but we certainly do not want a repetition of the rubber boom. Some people suggest that the withdrawal of American inquiries has been responsible for the reaction seen in prices, but, apart altogether from this, the setback was distinctly overdue. According to the last statistical returns, the stock in Liverpool was materially reduced in December, but that in London was added to, the net result at the two ports being an increase of 357 tons to 7,434 tons, against 7,349 tons last year. The United States is now receiving regular monthly shipments from Far Eastern plantations, which the United States Rubber Co. acquired some years ago at the cost of about 7 million dollars, and it is expected that the company named will get about 10 per cent. of its supplies this year from its own plantations in Sumatra. Some manufacturers in America are disappointed that they have not booked more business from the Allies, but the explanation suggested is that England, France and Russia are far better equipped to produce the large requirements of rubber goods needed than they have been to make army shoes and leather productions, in which their productive capacity is relatively less. A recent order was placed, however, for 200,000 pairs of hip boots, but this is nothing very important. The following shows the comparative statistics of shipments from the Federated Malay States during the past three years:—

	1913.	1914.	1915.
January	2,131	2,542	3,473 tons.
February	1,757	2,364	3,411 "
March	1,737	2,418	3,418 "
April	1,626	2,151	2,777 "
May	1,225	2,069	2,708 "
June	2,005	2,306	3,403 "
July	1,781	2,971	3,687 "
August	2,363	1,850	3,796 "
September	2,000	2,879	3,984 "
October	2,160	2,897	4,130 "
November	2,062	2,889	4,636 "
December	2,618	3,361	5,111 "
Total	23,465	30,697	44,524 "

From these it will be seen that last month established a new record for monthly exports, eclipsing the November figures (the previous best) by no less than 475 tons, and being only 341 tons below the total exports for 1910. The total for the year is also a record, surpassing last year's total by 13,827 tons. For the sake of comparison, it is interesting to record the aggregate export of plantation rubber from the Federated Malay States for the past seven years:—

1909, 2,641 tons; 1910, 5,452 tons; 1911, 8,792 tons; 1912, 15,506 tons; 1913, 23,465 tons; 1914, 30,697 tons; and 1915, 44,524 tons.

THE MOVEMENT OF COAL IN HOPPERS.

AN account of a research into the movement of grain, coal, &c., in the hoppers of bunkers and silos, published in the *Génie Civil*, contains particulars likely to be of interest to central station engineers who have under their charge bunkers filled with slack or other small coal. The experiments were carried out with the aid of a model representing a vertical section of a hopper, as shown in fig. 1; the front consisted of a sheet of glass, on which were ruled squares to serve as datum marks, and the side walls were of sheet steel, either straight or curved, and could be placed at various inclinations. The substance used for the experiments consisted of sand of two colours, which was

FIG. 1.—EXPERIMENTAL MODEL OF HOPPER.

charged into the hopper in layers, either vertical or horizontal, so as to indicate the progressive deformations of the originally parallel slices. The opening at the base of the hopper could be regulated to any desired width.

The accompanying illustrations, sketched from photographs of the experimental hopper, show clearly that it is always the uppermost layer which moves from the periphery towards the centre of the hopper, where it gradually sinks, whilst the next following layer tends to flow over it, and this holds good, no matter whether the orifice is large or small, the walls more or less inclined, straight, convex, or

coal in a bunker, and noting the moment when the whitened pieces appear at the outlet.

It has also been observed, when vertical iron pipes are driven deeply into the coal in a bunker, for the accommodation of thermometers to ascertain the temperature in the body of the coal, that these tubes remain *vertical* so long as the bunker is not in great part emptied, because the surface layer alone slides past them without dragging them with it, the mass of the coal remaining motionless and continuing to hold the pipes in their original vertical position, until the discharge of the coal eventually removes their support. The fact that the sloping walls of bunkers when empty show little evidence of friction further indicates that only the very last particles have slid upon them.

To summarise: The column of matter which stands upon the outlet is the first to be discharged; then the successive surface layers, and finally the parts that were at the bottom but against the walls and not immediately over the outlet.

To provide against the formation of voids in the mass, due to the jamming and arching of the larger pieces, which it is often awkward to get rid of, the best plan is to put the discharge valve at the very bottom of the hopper without any throat, and to give the outlet the full width of the base of the funnel; otherwise the pieces of coal find support in the dead angles at the bottom of the hopper and stay there, holding up those above them.

THE PREDETERMINATION OF THE PERFORMANCE OF DYNAMO-ELECTRIC MACHINERY.

By PROF. MILES WALKER, M.I.E.E.

(Abstract of Paper read before the INSTITUTION OF ELECTRICAL ENGINEERS, January 13th, 1916.)

ALMOST every electrical designer has his own particular method of calculating a machine and arriving roughly at its performance. Some of these methods are exceedingly short, the figures covering not more than a sheet of note-paper; others are exceedingly elaborate, occupying some 10 or 15 sheets of foolscap.

Our ability to foretell the performance of an electrical machine, whether it be an alternating-current or continuous-current generator or motor, or a rotary converter, depends in the main upon our ability to calculate:—

FIGS. 2—6.—DIAGRAMS SHOWING THE SLIDING OF GRAINS IN THE CASE OF VERTICAL LAYERS.

FIGS. 7—11.—DIAGRAMS SHOWING THE SLIDING OF GRAINS IN THE CASE OF HORIZONTAL LAYERS.

concave; the sand resting in the neighbourhood of the walls does not move until it becomes a surface layer, owing to the descent of all that has previously covered it. It is only when the walls are very sharply inclined that the whole of the mass of sand commences moving, and this is not a practical case, such a hopper being excessively high in comparison with its capacity.

Small coal, coke, &c., obeys the same laws, as one can easily prove by whitening with chalk the surface layer of the

1. The magnetising current;
2. The armature reaction;
3. The losses in copper and iron;
4. The temperature rise;
5. The commutating conditions.

The last of these headings requires a paper to itself, so that this paper will only deal with the first four.

Whatever the machine may be—alternating-current or continuous-current generator, induction motor, or rotary converter—the methods of calculating these quantities are in the main the

same. It is therefore possible to have one general method of calculation for all these machines; and if such a general method could be established it would greatly simplify the work of the student of design.

The methods of design described in text-books and in articles published in the technical journals, can be broadly divided into two classes:—

1. Those which take as the basis of the design the total flux per pole; and
2. Those which take as the basis the maximum flux density in the air-gap.

In many cases where the total flux per pole is taken as the starting point, the calculation proceeds on lines somewhat similar to those employed in the calculation of transformers. For instance, in calculating the electromotive force generated in the armature, one writes

$$E_g = K_t f s \Phi \times 10^{-8} \quad (1)$$

where f is the frequency, s the number of turns, Φ the flux per pole, and K_t a coefficient depending upon the field-form and coil breadth.

On the other hand, where the flux density in the air-gap is the initial quantity kept in view, the formula for the voltage generated in a single conductor takes the form

$$e_g = v B l \times 10^{-8} \quad (2)$$

where v is the velocity in centimetres per second, B the flux density in the air-gap, and l the length of iron in centimetres.

The first method has the advantage that, after fixing K_t , it only deals with the total flux, without troubling about the distribution of the lines of force in the air-gap; but this very feature limits its application to those cases where we are content to know the mean electromotive force generated. The first formula is, therefore, not so generally applicable as the second one, which gives us a more complete visualisation of what is happening under each pole.

It is possible to have a combination of these methods, which preserves the advantages of both. Suppose we have a rotor surrounded by the stator, as in an induction motor, but that the flux in the gap, instead of changing from point to point along the periphery, is of one sign and distributed uniformly, just as it is in a homopolar machine. If B is the flux density in the air-gap, r the radius of the rotor in centimetres, and n the speed in revolutions per second, then the total flux passing into the rotor will be $B \times 2\pi r l$, and the total flux out per second $B \times 2\pi r l n$.

Writing A_g for the total working surface of the armature (the area of the gap space) = $2\pi r l$, we have the electromotive force e_g generated in one conductor:—

$$e_g = A_g B n p_m \times 10^{-8} \quad (3)$$

$$e_g = A_g B n p_m \times (1/60) \times 10^{-8} \quad (4)$$

The expression $A_g B$ gives us the magnetic loading of the frame.

If now, instead of a uniform air-gap and a constant flux density, we have salient poles and a flux density varying from point to point along the gap, the formula for the average electromotive force generated in the conductor becomes

$$e_g = K_f \times A_g B \times n p_m \times (1/60) \times 10^{-8} \quad (5)$$

where K_f is a coefficient depending on the ratio of the pole-arc to the pole-pitch. This coefficient, K_f , is, in fact, equal to the ratio of the area of the curve representing the field-form to the area of the rectangular field-form which we should have if the pole-arcs were equal to the pole-pitch and the air-gap were perfectly uniform. Where a number of conductors, Z_a , are connected in series, as in the armature of a continuous-current generator, the formula for the total electromotive force generated becomes

$$E_g = K_f \times A_g B \times Z_a \times n p_m \times (1/60) \times 10^{-8} \quad (6)$$

Here $A_g B$ is the ideal magnetic loading of the frame; that is to say, the magnetic loading which we could have if the pole-arcs were equal to the pole-pitch. The coefficient K_f informs us what fraction of this ideal magnetic loading we have in the machine in question.

In the case of an alternating-current generator, the formula for the electromotive force can still take the same form as (6), but we must introduce a new coefficient, K_e , to take into account not only the area and shape of the field-form, but also the width of the phase-band of armature conductors, the taking of the square root of mean square value of the voltage, and the ratio of the number of conductors in series per phase to the total number, Z_a , of the conductors on the armature. Thus, for an alternating-current generator or motor we have

$$E_g = K_e \times n p_m \times Z_a \times A_g B \times (1/60) \times 10^{-8} \quad (7)$$

By the use of a suitable coefficient, K_e , this formula can be used for the electromotive force generated in any dynamo-electric machine; and for general use it has the following advantages in its favour:—

1. The formula contains the term B , representing the maximum value of the flux density in the air-gap, and for many reasons it is well to have this quantity continually before us.

2. The expression $A_g B$, the maximum flux density multiplied by the total area of the active surface of the armature, has a fairly definite maximum value for a given frame or carcass; so that if we are familiar with our frame we know by a glance at our calculation to what extent we are making good use of the material. For instance, if we have an armature of an alternating-current generator having a diameter of 150 cm. and a length of 30 cm., then $A_g = \pi \times 150 \times 30 = 14,160$; and if we know from experience that B in the air-gap cannot be made higher than 10,000 C.G.S. lines per sq. cm., the maximum value of $A_g B$ for that frame would be 1.4×10

As this quantity, $A_g B$, is almost independent of the number of poles, the designer soon comes to know the value it should have for any particular frame, and is able to judge at a glance how far he is utilising the magnetic circuit.

3. The maximum flux density in the teeth can be found by dividing $A_g B$ by the total section of all the teeth. This is a shorter and more convenient method than that employed where the total flux per pole is taken as the basis of calculation. In the latter case it is necessary to make an estimate of the virtual number of teeth per pole, and this is not a simple matter when the pole is bevelled.

4. The coefficient K_e has a certain recognised maximum value for a certain kind of machine. Thus, for a three-phase generator, K_e may be equal to 0.4. If it has a lower value in any calculation under consideration (as may be the case where the pole-arc is a small fraction of the pole-pitch), the designer's attention is called to that circumstance.

5. If we multiply both sides of Equation 7 by I_a , the current in the armature conductors, we get a formula for the output, containing the two expressions:—

$$A_g B, \text{ the magnetic loading; and} \\ I_a Z_a, \text{ the current loading.}$$

Both these quantities being clearly before us during our consideration of alternative designs, we can observe how one decreases and the other increases in the light for room which occurs between iron and copper.

Any general method of design should in its nuclear form be exceedingly short, and capable of reaching rough results in the course of a few minutes. At the same time it should be capable of developments which lead to more accurate results at any stage of the calculation. Moreover, a general system of calculation should be founded upon sound principles and not merely built upon empirical rules. A method of calculation which, though rough, is based on arguments that must be right from the very nature of things, helps the designer in the habit of forming rapid mental estimates; whereas an empirical rule, however often it may be applied, never gives its user the faculty of rapidly estimating with approximate accuracy, because it does not take into account all the factors that determine the result. A busy designer would never get through his work if he stopped to calculate everything. He guesses a great deal, or makes rapid mental estimates of quantities; he has not time to calculate. He is never justified in so guessing unless he knows with fair accuracy the limits of his possible error, and knows that with that error he would still have a machine which would comply with its specification. This faculty of guessing, when properly carried out, is really a process of rapid mental calculation based upon many machines calculated and tested in the past.

In most designing offices, calculation sheets are provided. The

FIG. 1.

figures relating to each dimension of the machine and each important quantity are given a definite place on the sheet, so that they can be readily referred to. The process of calculating, then, merely consists in filling in the proper figures in the appropriate places, and this is done in a certain order, the slide-rule or a short calculation being used to step from one quantity to the next.

It is usual to have one kind of calculation sheet for a continuous-current generator, another for an induction motor, and another for an alternating-current generator, and so forth. If, however,

one system of calculation is employed for all machines, one printed form can be employed for all; and there is a distinct advantage in this, because an improvement in method or an increase of rating can thereby be more readily extended from one class of machine to another.

The process of plotting the field-form of a salient-pole machine in cases where it is unnecessary to take account of the saturation of the teeth is fairly simple. In cases where the teeth of the field-magnet are tapered and highly saturated, the matter is somewhat more difficult. The following remarks relate to the case of a 2,700-k.v.a. three-phase turbo-generator, having a rotor 69 cm. in diameter and 115 cm. in length, with 32 slots spaced as if there were 42, each polar projection occupying the space of five slots which are uncut.

The method proposed by W. B. Hird* for dealing with taper teeth may be employed with advantage. Curves plotted somewhat after the manner proposed by Mr. Hird are shown in fig. 1. In order to allow for the magnetic flux which leaks along the slot and the ventilating duct, it is necessary to have a number of curves,

FIG. 2.

FIG. 3.

FIG. 4.

each for a particular value of K_s , where K_s is the ratio between the cross-section of the iron plus the cross-section of the air, to the cross-section of the iron, at any particular section under consideration.

The first step in the process of drawing the field-form is to plot an "air-gap and tooth-saturation" curve; indeed, where the slotting of the rotor is not uniform all round, it is necessary to have such a curve for each kind of slotting. Thus, one of these curves is required for the part of the rotor which is uniformly slotted, and another curve is required for the polar projection, which may be regarded as one large tooth. These curves are shown in fig. 2 and are marked F and G.

The first step is to find the relation between the flux density and the ampere-turns expended on the air-gap. This gives us the "air-gap line" shown dotted in the figure. For the part of the air-gap adjacent to the polar projections, where there are no slots in the rotor but only ventilating ducts, the air-gap coefficient is only 1.02,

FIG. 5.

The air-gap line of this part would therefore be slightly above the thick dotted line in fig. 2.

For the purpose of finding the ampere-turns expended on the teeth, we shall consider three sections of the teeth: one, C, taken on the surface of the rotor; another, D, half-way down the teeth; and another, E, at the root of the teeth.

It is convenient to make the calculation of the ampere-turns on the teeth for three densities in the gap, say, $B_g = 5,000, 6,000$ and $6,500$. It will be found that for $B_g = 5,000$ the ampere-turns on the part of the tooth lying between C and D are so small, compared with the ampere-turns on the part from D to E, that it is not worth

while to apply Hird's method to the upper part of the tooth. It is sufficient to take the mean density, and find the ampere-turns per centimetre from the magnetisation curve of the iron. To find the ampere-turns on the part D E, we find the value of $\int H dB$ for the value of B_g at D, and the value of $\int H dB$ for the value of B_g at the section E; the difference, divided by the difference between the values of B_g , gives the ampere-turns per centimetre, and hence the ampere-turns for the part of the tooth from D to E; so that the total ampere-turns on the tooth are obtained. This is set off from the thick dotted air-gap line in fig. 2, and gives us a point on the "air-gap and tooth-saturation" curve. Similarly, for $B_g = 6,000$ and $6,500$, the ampere-turns are found, and, adding these figures to the ampere-turns on the air-gap, we get the "air-gap and tooth-saturation" curve shown by curve F in fig. 2.

The saturation curve for the polar projection may be obtained in the same way, except that in this case it is necessary to take into account the leakage flux, which may be estimated by any of the known methods. The magnetisation curve for this part is shown by the curve G in fig. 2.

The method of obtaining the field-form at no-load, full voltage, is necessarily one of trial and error, because until we know the field-form we do not know accurately the value of K_s , and we cannot find K_s until we know the maximum ampere-turns on the poles. The usual practice is to guess the value of K_s from experience of previous machines, and from it to obtain an approximate value for the maximum flux density in the gap. From curve G we find the corresponding ampere-turns per pole. We now lay out the spacing of the slots in the rotor on the abscissa line as in fig. 3, and write down the ampere-turns per pole for the part of the iron encircled by the conductors in slot 8, slot 7, slot 6, and so on.

Referring now to Curve F, fig. 2, we are able to plot the values of the gap density opposite to each tooth. It will be seen that fig. 3 shows two curves; the inner dotted one gives the value of the flux density opposite to the tooth between slots 7 and 8, as obtained from fig. 2. This would lead to a field-form which is too narrow across the top. In order to avoid this, a steel wedge is put in the eighth slot, which avoids the super-saturation of the tooth between slots 7 and 8, and gives the field-form a broader top, as shown by the outer curve. The exact shape of this curve cannot be calculated; but the smooth curve shown in fig. 3 is sufficiently near the actual case for the purpose of finding K_s .

In order to calculate the total flux per pole it is convenient to use a coefficient which may be called the field-form coefficient, denoted by K_f , which gives the ratio between the area of the field-form and the area of the rectangle, the height of which is the

FIG. 6.

FIG. 7.

maximum flux density in the gap and the base pole-pitch. It is easily obtained in practice by running a planimeter around the curve in fig. 3, and then around the rectangle indicated by the dot and dash line. The ratio between these areas in fig. 3 is 0.625.

In order to plot the no-load magnetisation curve strictly one ought to go through the process of plotting the field form for a number of different excitations and find the voltage generated in each case. In practice, however, it will be found that with this type of field magnet the value of K_s does not change very much with change in the exciting current. We may for practical purposes take the voltage as proportional to the maximum flux density in the gap. If this is done we can plot the no-load magnetisation curve from the figures obtained for the ampere-turns on the central part of the pole for the voltages 6,000, 6,600, and 7,500. These are plotted in fig. 4. The dotted curve gives the increased

* "The Reluctance of the Teeth in a Slotted Armature," *Journal I.E.E.*, Vol. XXIX, p. 933, 1900.

ampere-turns required to allow for the saturation of the polar projection at full load. To find the ampere-turns at full load and 0.8 power factor one has recourse to a graphic construction.

The method of calculating the value of K_s when the field-form and the arrangement of the armature conductors are given, can be illustrated by working out this coefficient for the 2,700-K.V.A. turbo-generator the field-form of which is given in fig. 3.

In this case we have a three-phase, star-connected armature, so that the voltage between two terminals is that generated in a band of conductors occupying two-thirds of the pole-pitch. It will in general be found sufficient to calculate K_s as if there were 12 slots per pole, since a larger number of slots per pole does not sensibly affect the result. The pole-pitch is divided into 12 parts, six of which are marked off by little circles in the half field-form shown in fig. 3. We begin by taking values proportional to the flux density in the gap opposite any group of eight circles, which may be taken to represent the eight conductors lying in the band; the sum of these gives a figure proportional to the instantaneous voltage. When the field-magnet has moved through the space of one conductor, the voltage generated is proportional to the sum of a new set of values, and by a successive process of addition and subtraction, we obtain figures proportional to the voltage generated in the phase-band, which are plotted as shown in curve w, fig. 5; they give the wave-form of the electromotive force generated between the terminals of the three-phase star-connected winding.

The next step is to square the values of the ordinates of curve w, and plot them to some convenient scale, as shown in curve s. Now the value of K_s is the ratio of the virtual value of the voltage actually generated in the eight conductors, with the field-form shown in fig. 3, to the value of the voltage that one would get in a homopolar machine having a flux density equal to the maximum in fig. 5, with 12 conductors in series. In order to avoid any question of the scales to which fig. 5 is plotted, one may adopt the following plan: 12 conductors would have a generated voltage proportional to $12 \times 700 = 8,400$. The square of this is $70,56 \times 10^6$. Plot this squared voltage, as shown by the dotted line in fig. 5, to a scale $\frac{1}{10}$ th of that used for the curve s. A planimeter run round curve s gives a reading 1,322; a planimeter run round the dotted rectangle gives 860; this multiplied by 10 gives 8,600. Therefore the ratio of the square root of the mean square value of the voltage which is generated in the eight conductors to the square root of the mean square value which would be generated in a homopolar machine having 12 conductors is $\sqrt{(1,322/8,600)} = 0.392 = K_s$. This method is applicable to any arrangement of conductors.

In considering the armature reaction of a polyphase armature, we have to take into account not only the back magnetomotive force which it exerts, but also the back voltage that is generated in the winding by the leakage flux which passes across the slots and around the end-windings. A great deal has been written upon the method of calculating this leakage flux.

The calculation of the amount of effective leakage across the slots is most easily carried out by means of the formula $\lambda_s = \frac{1}{2} h_s d/b$, where h_s is the depth of the slot after a deduction has been made for the thickness of the insulation between the copper and the bottom of the slot, and b is the breadth of the slot. By λ_s we denote the lines across the slot per centimetre of axial length of slot for unit magnetomotive force. To this must be added the leakage across the mouth of the slot.

Whether the slot is open or semi-closed, the permeance across the mouth of the slot can be found from fig. 6. This figure is so constructed that a designer can tell at once from inspection the effect of changes in the shape of the lips upon the permeance. The shape of the lip is indicated by shading, as shown in the figure, and the shading may extend either to the line o a as shown, or to the line d c, or to the line o' b. The position of the small face p may be varied, so that the fraction (mouth of slot)/(width of slot) has any value between zero and 1. At whatever point we choose to draw p, it is only necessary to continue up the vertical line from p, as shown in the figure, until it cuts one of the curves c', a', or b', corresponding to the depth of the lip, and we can at once read off the permeance λ_m per centimetre of axial length of slot. For example, in fig. 6 the lip is supposed to be of the shape indicated by the shading, the value of (mouth of slot)/(width of slot) being 0.375. If we carry up the perpendicular from p to the curve a', we find that the permeance in C.G.S. lines per cm. length of iron is 0.98. Had the lip been of a deeper design, so as to extend up to the dotted line d c, we should have carried our perpendicular up to the dotted curve c', and the permeance would then be found to be 1.2. If the lip is of a special shape, or has the angle of one of its faces different from that shown in the figure, it is easy to sketch on our figure a lip having the same permeance and having face angles enabling fig. 6 to be instantly applied.

When calculating the leakage due to the rotor slot, it is convenient to multiply the sum of λ_s and λ_m , obtained in the way shown in the last example, by the ratio (No. of stator slots)/(No. of rotor slots). This enables the result to be added directly to the stator permeance, and the total leakage can be calculated from the number of ampere wires in the stator slot.

For roughly estimating the zig-zag leakage, a simple rule is given here, which works well enough in practice.

The reluctance of the path of the zig-zag leakage is in the main proportional to the length of the air-gap. The width of the path changes as the teeth change their relative positions. If we assume that the dimensions of the teeth and the mouths of the slots are such as one generally finds in practice, it is possible, roughly, to take into account the changing width of the leakage path by means of a coefficient, K_z , and we may write

$$\lambda_z = K_z \times \frac{1}{2} \text{pitch of slot} \times 1/(\text{length of gap} \times K_s),$$

where λ_z denotes the lines of zig-zag leakage per centimetre axial length of slot, for unit magnetomotive force applied across the mouth of a stator slot. The values of K_z , which may ordinarily be employed in practice are given in fig. 7 as a function of the ratio (No. of stator slots)/(No. of rotor slots).

If we now add together the permeances due to the stator slot, the rotor slot, and the zig-zag path per centimetre of axial length, and multiply by twice the length of iron, we arrive at an approximate figure for the permeance of the path of magnetic leakage from one pole, so far as the first three parts of the leakage above referred to are concerned. Leaving out of account for the moment the leakage due to the end-windings, we can get the leakage in the iron paths in C.G.S. lines per pole by multiplying the total permeance calculated above by the maximum ampere-wires per slot and by 1.257.

The only really accurate way of finding the value of the end leakage of an induction motor is by experiment on the winding in question. If we have two motors built on the same frame with the same type of winding, but one machine much longer than the other, we can, by measuring the short-circuit current on each machine, calculate with some accuracy what part of the leakage reactance in each machine is due to the end-windings. When once this has been ascertained it can be put on record and the figure used in similar cases. A simple method of finding roughly the amount of end leakage that may be expected on a given machine is given in the paper. The whole matter is so complicated by accidental circumstances that it is useless to attempt any accurate calculation.

The methods of calculating the copper losses in electrical machines are fairly well standardised. So far as the iron losses in the machine are concerned, it is impossible to determine these beforehand with any degree of accuracy. Experience shows that two machines, built to exactly the same drawings, and, so far as can be ascertained, with the same care, will have widely differing iron losses, owing to small accidents in the handling of the iron stampings. It is, therefore, not worth while to make a very elaborate calculation of iron losses; many engineers use a curve giving the combined hysteresis and eddy-current losses per cubic centimetre

FIG. 8.—IRON-LOSS CURVES.

at different maximum flux densities. Such curves, to be of service, should be based on the average results obtained from running machines, rather than on purely theoretical considerations. The author has seen curves of this kind plotted on the assumption that the eddy-current losses increase in proportion to the square of the flux density, and the hysteresis losses in proportion to $B^{1.6}$. Such curves will be found in practice to give too high values for the loss in the iron at very high densities, because the hysteresis loss does not increase as $B^{1.6}$ at high densities. In fact, it has been shown that where the magnetic field is a rotating magnetic field, the hysteresis loss is zero for flux densities above 22,000; and even for an alternating field it becomes almost constant for densities greater than 22,000. In most electrical machinery the field is partly rotating and partly alternating, and we may certainly take it that the hysteresis loss does not increase at all at high flux densities such as are used in the teeth of continuous-current generators. It thus comes about that for low frequencies the curves giving combined loss take a shape somewhat like the curve shown in fig. 8, a curious inflection occurring at $B =$ about 20,000. These curves are plotted for ordinary dynamo steel of a thickness of 0.04 cm. and subjected to as careful treatment as is consistent with ordinary shop processes. The losses shown in the curve are about twice as great as the theoretical losses calculated from the tests on samples having no burrs or short-circuits such as commonly occur in the built-up machines. Experience shows that curves of this kind will give, on the average, the losses with sufficient accuracy for commercial purposes.

Iron-loss tests taken on completed machines will generally show greater losses than are given by these curves, particularly at high flux densities. It would appear that when the teeth of a machine become saturated, the flux from the poles bulges out sideways and attacks the armature from the ends, making eddy currents in the end-plates, so that the loss sometimes increases in ratio greater

than the square of the flux density. This end-plate loss should really be allowed for separately, as its amount will depend upon factors different from those taken into account in calculating the true iron loss. A good deal of experimental work still remains to be done before we can formulate a method of calculating these end-plate losses.

Where special silicon steel is employed, the losses may be reduced by 40 per cent. when working at a flux density of 10,000 per sq. cm., at a frequency of 50 cycles, the thickness of the iron being 0.05 cm.

Predetermination of Temperature Rise.—In a previous paper before the Institution, the present author, in conjunction with Mr. H. D. Symons,* gave certain rules for the predetermination of the temperature rise in various parts of electrical machines; since that time further experiments have been made, particularly in connection with the passage of heat from the walls of ventilating ducts to the air passing along the ducts, and also in connection with the cooling of field coils.

Experiments with ducts indicate that the specific cooling constant is dependent not only upon the mean velocity of the air through the duct, but also upon the character of the motion of the air. The cooling conditions for the same amount of air passed through the duct may be three or four times as great where there are considerable eddies as where the air moves in even stream-lines. This circumstance makes experiments upon the specific cooling constant in ventilating ducts somewhat difficult and inconclusive, and is the cause of the wide divergencies in the results obtained by different experimenters.

In order to arrive at more definite values, the author and Mr. W. H. Blythe made a number of experiments with various kinds of ducts over a considerable range of air velocity and under varying conditions. The results of these experiments are contained in a contribution presented to the Institution.

These results can be shortly stated as follows:—If we denote the flow of heat from the walls of the ventilating duct, expressed in watts per square centimetre per degree C. difference of temperature between wall and air, by the symbol h , then we find that over a wide range of speed $h = K_v v$, where v is the mean velocity of the air in the duct measured in metres per second, and K_v is a constant depending on the character of the duct. K_v is very much affected by the amount of baffling of the air in the duct. A circular duct 2 in. in diameter gave a value of K_v as low as 0.00083 when the air passed through with long steady stream lines, but the addition of baffles brought the value up to 0.0011. For ordinary flat ducts about $\frac{1}{4}$ in. wide it would seem that the constant K_v may be anything from 0.0005 to 0.0014, depending on the amount of eddy currents in the air in passing along the duct. Where the ducts are dirty, the value of K_v may be very much lower still.

The cooling of the iron of the stator is considerably helped by the conduction of the heat into the cast-iron frame, from which it is passed by radiation and convection to the surrounding air. It is generally impossible to make an accurate calculation of the amount of this conduction. The author has found that with ordinary box-type cast-iron frames, with the punchings dovetailed into the cast-iron, to allow 0.15 watt per square centimetre is suitable where a temperature rise of 40° C. is permissible.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

A Photoelectric Relay.

The sensitive photoelectric relay illustrated herewith, which may be used for various scientific and technical purposes, consists of a glass tube 6 cm. in diameter and 19 cm. in length, in which the aluminium plate D' can be moved toward the wire net B by means of a magnet acting on the iron cylinder E . A little rubidium is distilled in the vacuum through the side tube F on the plate D' , which in this way can be uniformly covered with the alkali metal. Hydrogen will then be admitted and the surface of the alkali metal rendered sensitive by means of the glow discharge. The hydrogen will be replaced by argon until the sensitiveness is a maximum. The light of an incandescent lamp at a distance of 50 cm. passes through the two wire nets B and C and liberates the electrons in the position D from the rubidium-hydrogen. These electrons move under the influence of a small potential difference from D to B , where they enter the electric field between C and B , which is so strong that ionisation by collision takes place. Through this process the current between B and C becomes very large. The currents between D and B and B and C can be varied within wide limits by a variation of the pressure and of the distances between the electrodes.

In the course of experiments conducted in the physics laboratory of the University of Illinois, Urbana, the distance between B and C was kept constant, about 5 mm., while the distance between D and B was varied from 3 mm. to 30 mm. The primary or photoelectric current between D and B varied from 3×10^{-10} to 10^{-7} amp., and the secondary or ionisation current from 10^{-7} to 10^{-2} amp. The maximum secondary current was sufficient to close an ordinary relay. The secondary voltage required for the maximum current was 135 volts. A further increase of this tension produces a glow discharge which persists even when the primary current is interrupted. This apparatus thus acts as a relay, a weak primary current closing the circuit of a relatively strong secondary current.

Amongst other applications the device may be used for the detection of electromagnetic waves; a telephone relay for weak electric currents; a thermostat for the regulation of temperature

FIG. 1.—SENSITIVE PHOTOELECTRIC RELAY.

within a very small fraction of a degree; and a light sensitive relay. In lecture experiments performed by means of this relay a beam of light has been made to ring a bell or to turn on a group of incandescent lamps.—Jacob Kutz, in the *Electrical World*.

New Ultra-violet Lamp.

It is reported that a Mr. Simpson, who was experimenting with rare metals, recently discovered that the light emanating from an arc between certain ores possessed powerful therapeutic qualities, greater than those of the Finzen lamp, as it is richer in ultra-violet rays. Investigations are in progress at St. Bartholomew's Hospital, London, and the results obtained so far have been very promising.

LEGAL.

Re CEDES ELECTRIC TRACTION, LTD.

A DEBENTURE-HOLDERS' action by the Austrian Daimler Motor Co., Ltd., against the Cedes Electric Traction, Ltd., was mentioned to Mr. Justice Neville in the Chancery Division on Friday last, upon a motion by the plaintiffs for the appointment of a receiver and manager.

MR. DIGHTON POLLOCK, for the plaintiffs, said that the ground of the motion was jeopardy. A petition to wind up the Cedes Co. was down for hearing on Tuesday, and it would be necessary to find money to pay this week's wages.

MR. WARD COLDRIDGE, K.C., for the defendant company, said there was sufficient money at the bank to pay the full amount of the company's indebtedness and the wages, but the petition had created a difficulty in getting at this money. The company had important and remunerative contracts running.

His LORDSHIP appointed a receiver and manager with liberty to borrow enough to pay the week's wages if necessary; but he recommended the parties to lay their heads together and come to some agreement, so that the petition could be got rid of before Tuesday.

ALLEGED FRAUDULENT TRAMWAY CLAIM.

MR. JUSTICE SCRUTTON in the King's Bench Division, on January 13th, entered judgment for the London County Council in a claim for damages by Henry Barker, of Tottenham, for injuries alleged to have been received in a tramway mishap. The jury held that the claim was a fraudulent one from beginning to end.

It was stated that a collision occurred between the car in which Barker was a passenger and another car at Ponder's End, on June 11th, 1914. The plaintiff alleged that a fellow passenger weighing 19 stone was thrown on to him, causing concussion of the spine and other injuries.

On the application of counsel for the defendants, Mr. Justice Scrutton ordered the papers in the case to be impounded for further consideration.

WYNSTANLEY, T. MACARTNEY, McELOY & Co., LTD.

MR. JUSTICE SCRUTTON, in the King's Bench Division, on January 12th, gave judgment in this action, which was heard last term. He gave plaintiff £100 damages for the wrongful dismissal from the directorship. He gave judgment for the defendants for £800, £90 and £48 which the plaintiff had obtained from the company, while the defendants failed in their counterclaim for £35 and £192 and 200 Malta Tramway shares. As each side had partly succeeded, he would save them expense by holding that each should pay their own costs. Concluding, his Lordship expressed his great regret that a part of the burden of this litigation would fall on infant shareholders whose interests had been entrusted to unfaithful and incompetent people. He hoped means would be found to remove some of that burden to the directors, and especially to Mr. Frank Macartney, who, since his father's death, had much to answer for. He was quite unfit to hold the position of director of the defendant or any other company.

* *Journal I.E.E.*, Vol. 48, p. 647, 1912.

MUNITIONS COURT CASES.

At the Rochdale Munitions Court on the 6th inst., a labourer at the Rochdale electricity works asked for a leaving certificate, which he alleged had been withheld. He stated that he had been discharged on December 22nd, and had been unable to get employment elsewhere because he had not the certificate. The borough electrical engineer, Mr. C. C. Atchison, said the request for a certificate had not reached him, or he would have granted one. He agreed to give applicant a leaving certificate and a monetary grant for the mistake.

At the same Court another employé at the Rochdale electricity works—a turner—desired a leaving certificate in order that he might do work of a more particular character in the manufacture of munitions. He said he worked on a lathe only five hours a day, and, being a rheumatic subject, the steam and heat affected his health. Mr. Atchison said the works supplied electricity to important works. He was willing to release the applicant as soon as he could be replaced. The application was eventually withdrawn on the understanding that the certificate should be given within a month.

Before the Oldham Munitions Tribunal last week, Messrs. Ferranti, Ltd., lodged a complaint against five youths who "did not work diligently under the rules." It appeared that at 6 o'clock one morning the five youths were found by the night watchman playing cards by the light of a candle. They had been on the night shift, and should have gone away at 7 a.m. Three of the lads said they were not playing for money, another said he had merely stopped to watch the play, and the fifth said they were playing banker for money. The youth who said he had merely stayed to watch was let off, and the remainder were fined 5s. each.

Another case at the same Court concerned George W. Sugden, a crane-driver employed by Messrs. J. P. Hall & Co., electrical engineers. Sugden asked for a leaving certificate, his case being that when he started as a spare man, on November 9th, he understood that his commencing wages of 28s. were to be increased to 27s. if he agreed to take the job on permanently. He now found he would have to wait six months for a rise, and as he had an offer of 35s. a week, he wanted to leave to better himself. He complained also that his present work was injurious to his health and eyesight. Mr. Hall (for the firm) said that the man had been engaged entirely on important work. He was not a spare man at all, and his wages were started at 23s., and would advance to 27s. which was the standard. It was also alleged against Sugden that he had done things with a view to getting discharged, one instance cited being that he ran a load over some men who were working, which was contrary to the rules. Mr. W. Sellers (chairman) asked how a man could be indispensable who was only worth 23s. per week. Mr. Hall: He is one of the links in the chain forming an indispensable whole. There is no man indispensable if you put it that way. Mr. Hall added that they would have difficulty in replacing this man, and it would take a week or a fortnight to teach a man. Sugden's application was granted.

The question whether the electricians in a Govan shipyard should receive an allowance for the half-hour tea interval when ordered to work overtime was raised last week at a Local Munitions Tribunal in Glasgow. The case was raised at the instance of Messrs. Alexander Stephen & Sons, shipbuilders, Linthouse, who charged a number of their workmen with having, on December 22nd, infringed the rules of the Munitions Act by refusing to work after 7.30 p.m. unless they were paid for their tea interval, contrary to the practice of the establishment.

Mr. Biggart appeared for the firm, while Mr. A. Stewart, Electrical Trades Union, represented the men.

According to a Scottish paper, it was stated in the course of the evidence for the prosecution that the men, who were electricians, had declined to work overtime unless they were paid for the half-hour tea interval. After being informed that the matter would be referred to the Munitions Tribunal they still refused.—In answer to the men's agent, the foreman electrician, who had given the order to work overtime, said the men refused to work overtime unless they received payment for the tea interval. In the presence of witnesses the electricians were asked individually to work overtime, and witness had found out that the majority of them were perfectly willing to work, but said "they were on the horns of a dilemma," as they had been instructed by the Union not to work without payment for the tea interval.—MR. STEWART remarked that this matter was irrelevant to the case, but the CHAIRMAN held that it was an answer to a question.—For the defence, a workman said he was employed with a firm who did sub-contracting work for Messrs. Stephen, and he received payment for the tea interval.—MR. STEWART said this was a case for arbitration, and the workmen were prepared to go to arbitration on the question. They had endeavoured to have a conference on the subject with the employers, but had been refused. He thought the men should be dismissed, pending arbitration.

The Court found that the charge against the men had been proved, and fined each of them 10s., payable in two weekly instalments to be deducted from their wages.

TAYLOR & FARLEY v. THE WEST BROMWICH CORPORATION

THIS case was again before Mr. Justice Neville in the Chancery Division on Friday.

MR. WILLIAM MACKENZIE, for the plaintiffs, said that in this case his Lordship had granted an interim injunction over the day, restraining the Corporation from discontinuing or curtailing the supply of electrical energy for power to the plaintiffs. By an agreement made in 1912, the plaintiffs were entitled to a supply of

electrical energy for five years, but recently the Corporation had sent a letter threatening to cut off the supply of energy during certain hours.

MR. WHEELER, for the defendant Corporation, said there was a difficult question of law to be decided on the contract, and this could best be dealt with at the trial. Until then the Corporation would give an undertaking in the terms of the order made over that day.

HIS LORDSHIP: I remember the case, and I think your clients are acting rightly.

MR. WHEELER: I will not discontinue or curtail the supply at any time during the night or day; but plaintiffs should give an undertaking that if defendants succeed at the trial they will pay for power supplied to them at the same rate as other consumers.

HIS LORDSHIP: I don't like that form of undertaking. Let it be in the usual form.

CECIL HODGES & CO., LTD., v. ELLIS & WARD.

IN the City of London Court, on January 17th, before Sir John Paget, Bart., K.C., Deputy Judge, an action which had been remitted from the High Court of Justice, was brought by plaintiffs against defendants, to recover £96 for an electric lighting installation at Bristol. Mr. Clements appeared for the plaintiffs, and Mr. Lincoln Reed for the defendants. Mr. Clements said in respect of the claim £69 had been paid into Court in respect of switchboards and electrical appliances, and there was no dispute about the delivery of the goods, but the defendants said they were entitled to set off £27, and counter-claim for £24, because certain goods were not supplied that ought to have been supplied, or work which ought to have been done had not been done. They further said they had to employ men and had to make temporary arrangements for power fuses and lighting fuses, and go to other expense in travelling from Bristol to London. Mr. Reed said a large number of ivorine labels ordered had not yet been delivered. Mr. Clements said the whole contract was based upon a quotation of December 11th, 1914. Full details of the contract were given, and in the course of the hearing Mr. Cecil Hodges, the managing director of the plaintiff company, was called. He said that they still had some labels to be sent. They did not get the instructions for them until a long time after they had the instructions for the boards. Great delay was caused by the Government war work, which was being done by the foundry people. They had not to do the drillings in the switchboards. He had never heard a word about the defendants having, as now alleged, to get temporary plant and make journeys to London, until the present proceedings. It was an oversight on his part not to tell the defendants that he could not execute the order within four weeks when the alterations were made. No doubt the defendants wanted quick delivery, and they did the best they could in the circumstances. The reason why 97 labels were not supplied was because they had been overlooked. Mr. Reed urged that after that admission plaintiffs could not recover at all because the contract was indivisible and plaintiffs had not fulfilled it. The Deputy Judge ruled against that contention. Mr. David Dalrymple, foundry manager, Wolverhampton, said he made the iron cases for the plaintiffs. The work was very much delayed because of important work. Mr. Ellis said it was very important that the labels should be put on the fuses, as everything was done by motor in the factory in question. It was all electrical work. At present they were incomplete. For the defence evidence was called to show that the plaintiffs had not carried out their work according to specification. The result was that the defendants had got the work done elsewhere at an expense which was now counter-claimed for. The Deputy Judge said he quite realised the importance of labels being put on the switches, and that the haphazard method adopted by the defendants with high-power machinery was very unsatisfactory. He held that the plaintiffs were entitled to recover £69 paid into Court, but no more. He gave them judgment for that amount on the claim, without costs, and he awarded the defendants £24, with costs on the counter-claim, that being the amount of expenses they had been put to in consequence of the plaintiffs not carrying out their contract.

CONSOLIDATED DIESEL ENGINE MANUFACTURERS, LTD.

THE summons in the liquidation of this company which asked for the appointment of an additional liquidator with Sir William Peat again came before Mr. Justice Astbury in the Companies Winding-up Court: the former hearing was in November.

MR. H. COZENS-HARDY, K.C., said the application was on behalf of three members of the committee of inspection of five, who were of opinion that the liquidation should not be solely in the hands of Sir William Peat. They made no reflection on the personal integrity of that gentleman, but they thought it was undesirable that he should remain in sole control. On the suggestion of his Lordship, a meeting of shareholders was held on December 1st for the purpose of expressing their wishes in the matter. On a large poll 207,333 votes were recorded in favour of the sole control by Sir William Peat, 30,000 in favour of an additional liquidator, and 135,000 in favour of his removal. That amounted to a majority of five to four in favour of Sir William Peat's continuance alone. If one firm's holding was deducted from the figures, the result would be seven for and eight against his continuance alone. It was said that there was a large claim against this firm, and that their votes ought to be deducted.

HIS LORDSHIP said he had received a message from the Official Receiver that Sir William Peat would have no objection to the appointment of a joint liquidator if his Lordship approved of that course.

MR. MARSHALL, K.C. (for Sir William Peat), said the views of the majority should be given effect to. They did not desire a change, and Sir William Peat did not object to an additional liquidator "if the shareholders desired it."

HIS LORDSHIP, in giving his decision, expressed his surprise that Sir William Peat did not come to the conclusion in his own interests that there should be a co-liquidator. He, however, saw no kind of case for removing him, and he had no jurisdiction to adversely appoint a co-liquidator unless he re-summoned the original meetings in the winding-up. That he did not intend to do. He had no alternative, though he regretted it, but to act upon the decision of the small majority of shareholders and to refuse the application. As, however, it was a perfectly proper summons to bring, his Lordship ordered the costs of all parties to be costs in the liquidation.

IN re BARTON-WRIGHT.

BEFORE Mr. Justice Scrutton, in the King's Bench Division last week, application was made on behalf of a judgment creditor, Mrs. Beattie, for E.W. Barton-Wright, electro-therapeutic specialist, Oxford Street, to show cause why he should not liquidate a judgment debt of £224 by instalments. The evidence, as reported in the *Times*, showed that defendant was advertising in certain journals that the rush of patients had necessitated an increase in the number of his dressing rooms. The Court ordered debtor to pay £12 a month, but debtor said it was quite impossible—a remark which drew from the judge the remark, "Then you will probably go to prison if you do not pay."

TINOL SOLDERING PASTE.

ON Monday an application was made in the Patents Court, set up to deal with the patents of alien enemies, before the Controller, Mr. Temple Franks, and the Deputy Controller, Sir Cornelius Dalton, by Messrs. Bi-Metals, Ltd., of 57, Lant Street, Southwark, who asked for rights to use the trade-marks of Tinol in connection with two German patents—Nos. 13,557 of 1903, and 17,624 of 1904—under which they had been given licence to manufacture by the Board of Trade.

MR. INSKIP, K.C., appeared for the applicants, and stated that the patent No. 13,557 was registered by Jacob Callman, of 65, Gitchinerstrasse, Berlin, and Rudolf Brmann, 26, Walterstrasse, Berlin-Rixdorf, and claimed a method for intimately associating finely powdered soft solder, such as tin or tin alloy, in a paste, with a deoxidising agent like zinc chloride, or ammonium chloride, or both, and a thickening body such as cellulose, which burns easily and leaves no trace.

The patent, registered by Maximilian Leisel, of 10, Handelstrasse, Köln-am-Rhine, and Rudolf Küpper, 7, Grandorferstrasse, Bonn-Endenich, provided a substitute in electrical work for soldering with resin and tin. In addition to the aqueous solution of ammonium chloride, or chloride of zinc, or the double chloride for soft solder, it used borax, water-glass, or glass powder, for hard soldering, and met the three requirements of (1) a soldering metal in a fine state of division, (2) a flux which did not leave behind an oxide residue to impair the joint, and (3) a neutral liquid organic substance which did not evaporate until the soldering metal or the flux had done its work. The soldering flux-chloride, or borax, was mixed with glycerine, and the metallic powder or finely comminuted metal. The neutral liquid organic substance protected the metal from oxidation.

MR. INSKIP explained to the Court that in October, 1914, the applicants were the English agents for a German manufacturing corporation. The Board of Trade had granted Bi-Metals, Ltd., the right themselves to manufacture under these patents, on payment of a royalty of 10 per cent. on the gross selling price. From the Patents Court had come the suggestion that they should take the trade marks as well, and they were now applying for them. As selling agents in this country before the war for the Küppers Metallwerke Gesellschaft m.b.H., of Bonn-am-Rhein, the applicants had the option to purchase the patent rights. That option had expired before the war, and they had then entered into negotiations to renew it. They, of course, had no relations with the German firm now.

MR. PERCY GOOD, a director of the applicant firm, was asked whether they had ever had any complaint of the efficiency of this method compared with the old mode of soldering.

The witness answered that they had had one complaint since the war broke out. That was when, for the purposes of munitions, all the pure glycerine was required. Bi-Metals, Ltd., attempted to manufacture with crude glycerine and found that it did not answer. Apart from the 2 cwt. or so made then, they had never had any difficulty. They at once communicated with the authorities and got leave to obtain all the pure glycerine they required. They continued to receive repeat orders from engineering and other firms which used the composition in all directions.

THE CONTROLLER OF PATENTS observed that very few trade-mark rights had been granted by that Court, because he considered it desirable that the marks should apply strictly to the articles with which they had been associated. Here, however, was a case apparently in which this condition was fulfilled, and as Bi-Metals, Ltd., were manufacturing in this country they wished to place the label on the tins of paste, as had been done before the war. The contents were identical. They would hear shortly from the Board of Trade as to their application.

ELECTRICAL PRECIPITATION OF SMOKE AND DUST.*

IN an address recently delivered in New York, and reported in *Metallurgical and Chemical Engineering*, Mr. LANS BRADLEY stated that in the application of electricity to the recovery of valuable by-products a Californian, Dr. F. G. Cottrell, had done more to advance both the science and the art than any other individual.

The problems of removing from gases minute particles suspended therein were of great variety, and existed not only in thickly settled industrial communities but also in sparsely settled States. Requests for a solution of specific problems had been received from north-eastern Canada, Cuba, Mexico, Hawaiian Islands and Alaska, to say nothing of inquiries from across the seas. In New York City inquiries had ranged from the collection of diamond chips suspended in a small volume of air up to the collection of cinders and small pieces of coke from gases arising from boilers under which about 3,000 tons of coal were burned every 24 hours. It was obvious that the saving of values was the object to be attained by collecting the diamond chips, while in the latter case the cinders and coke particles constituted a serious nuisance in the neighbourhood.

Portland cement plants generally had severe dust problems, as they fed finely-ground materials into long cylindrical kilns near the point where large volumes of gas were rapidly emerging, and in such a manner that the gases picked up a large quantity of dust. Instances were known where the quantity of dust from a cement plant approached from 200 to 400 tons per day, which was scattered broadcast over the district surrounding the plant. At iron blast furnaces the finely-divided ore was charged in such a way that dusting was facilitated. Reports had been obtained which showed that the total amount of iron ore and coke lost in this manner amounted to a very large tonnage yearly, and this dust might be worth from \$3 to \$3.50 per ton. Calculation had shown that by removing the particles from the gases from one iron blast furnace, without cooling the gases, the value of the conserved heat energy might amount to about \$25,000 per annum.

It was not unusual for a fair-sized smelter to waste 1,000 tons of sulphur daily by discharging it into the atmosphere in the form of sulphur dioxide, notwithstanding the fact that sulphur was a very necessary commodity.

Waste gases at smelteries and refineries also contained metals and other elements, the recovery of which often would be warranted for the additional revenue which they would produce; investigations at one smelterly showed that metals having a gross value of approximately \$4,000 per day were being discharged into the atmosphere.

In large brass foundries perhaps 3 per cent. of all the zinc charged into the crucibles was burned off or volatilised and discharged into the atmosphere, thus constituting an economic loss aggregating many thousands of dollars per annum. In the production of metallic zinc from ore a considerable percentage of zinc was lost as fume.

At a sulphuric acid plant where a large quantity of acid was concentrated in stills, investigation showed that 2 to 3 tons of sulphuric acid were being wasted daily as mist. At another plant hydrochloric acid fumes had been killing vegetation in an adjacent park, but at present the trees and shrubs were thriving, as the acid fumes were being collected electrically.

In ventilating modern public buildings, and even up-to-date factory buildings, it was considered desirable to control the temperature and humidity of the air and remove all dust, bacteria, etc. In one recent installation it had been found that by circulating 50,000 cu. ft. of air per minute in a closed system, removing dust, etc., by electrical precipitation, the saving in steam which would be required for preheating this quantity of air in cold weather much more than paid a good return on the investment. Here the primary object was conservation of steam.

With a proper arrangement of pipes or plates and wires acting respectively as "collecting electrodes" and "discharge electrodes," it was possible to produce a discharge of electricity from the wires to the pipes or plates through gases present between them.

In electrical precipitations it was customary to employ very high voltages, such as, say, 75,000 to 100,000. With such voltages as these it was possible to subject a gas to such strains that it was changed from a non-conducting to a conducting medium.

Each of the particles of dust or fume collected a charge of electricity of the same polarity as the discharge electrode, and since two bodies charged with the same kind of electricity repelled each other, the particles were driven away from the wire and drawn toward the pipe or plate (collecting electrode). The more electricity upon a particle the greater was the force acting upon it, therefore in practice a strong discharge was maintained. Furthermore, the greater the voltage between the electrodes the stronger was the precipitating force; this made it desirable to operate at a voltage just below that where a spark or arc would form. Moving gases exerted a force upon suspended particles, and the greater the velocity the

*An article on this subject appeared in the *ELECTRICAL REVIEW* of May 14th, 1915.

greater was this force; hence, with a given precipitating apparatus, there was an upper limit to the gas velocity at which the suspended particles might be completely removed.

Direct current at high voltages was required, as alternating current at commercial frequencies was not suitable for this work. Large volumes of gases required, as a rule, more power than smaller volumes, but the power consumption was affected by other factors. Static machines did not furnish enough power for commercial installations and were not dependable. In commercial installations ordinary black iron pipes about 12 in. or 18 in. in diameter by 15 ft. to 20 ft. long were in general use, connected to a gas chamber at each end in a manner similar to that in a tubular boiler. With this arrangement gases and suspended particles might readily be distributed to the various pipes, and through them to another gas chamber, having been cleaned during such passage. The cleaned gases might be conducted to other places as desired.

The precipitating apparatus might be designed for either hot or cold gases, and for corrosive or non-corrosive materials, and the product might be collected either wet or dry as conditions might indicate. In treating gases containing particles of acid held in suspension, materials such as lead or stoneware were employed to avoid serious corrosion. Heat-insulating materials might be employed in the apparatus to lessen the loss of heat energy when desired. The gases might be either forced or pulled through by fans or other mechanical means, or if the gases were sufficiently warm natural draught might be employed. When treating gases which were explosive when mixed with air, they were kept under a pressure slightly greater than atmospheric until they had been cleaned.

The high-voltage direct current was obtained by transforming low-voltage into high-voltage alternating current and then converting or rectifying the latter into an intermittent, high-voltage direct current. The amount of power required in commercial installations was relatively low, generally being much smaller than that necessary for any other gas-cleaning system.

A unique advantage of electrical precipitation was its ability to collect even the most minute particles. Another interesting feature was that components of gases of different volatilities might be separated by what had been termed "fractional precipitation." In this method the gases were treated while at a high temperature to remove those materials which were then either solid or liquid, and then after further cooling the gases were subjected to another treatment in a separate precipitator. Arsenic trioxide of high purity had thus been separated from copper, iron, zinc and other materials. It would be possible to obtain water-free tar in gas plants by this means, and also it might be possible to collect tars of different compositions.

Many other instances could be given, and the author hoped that chemists, engineers and others would give more earnest consideration to smoke, fume and dust problems and endeavour to solve them, not only for the sake of better atmospheric conditions and for aesthetic reasons, but also for the values which were to be obtained when their solution was accomplished.

WAR ITEMS.

Trade after the War.—At a meeting of the Advisory Committee to the Board of Trade on Commercial Intelligence held last week, among matters considered were proposals for the safeguarding and promotion of British trade after the war; the more systematic collection and exhibition of samples of German and Austrian goods competing with British manufacturers in Colonial and foreign markets; and questions relating to the work of the Commercial Intelligence Branch of the Board of Trade. Further reference to the work of this committee appears on page 76.

Lord Derby will be present at the meeting which is being organised for January 31st at the Guildhall.

The London Chamber of Commerce had before it last week the report of a special committee on the subject of "Trade during and after the war." The main recommendations, according to the "Financial Times," are the following:—

1. That any measures which may be considered in connection with trade during and after the war should provide: (a) For preferential reciprocal trading relations between all parts of the British Empire; (b) for reciprocal trading relations between the British Empire and the Allied countries; (c) for the favourable treatment of neutral countries; and (d) for regulating, by tariffs and otherwise, trade relations with all enemy countries, so as to render impossible a return to pre-war conditions and for stimulating the development of home manufactures and the consequent increased employment of native labour.

2. That steps should be taken to prevent the dumping and under-valuation of enemy goods into British markets after the war.

3. That discriminatory taxes be levied on the tonnage of all enemy ships using the ports of the British Empire.

4. That the Government be urged to encourage the production and utilisation of raw materials and manufactured goods within the Empire under such legislative conditions as will prevent their being controlled by or on behalf of subjects of enemy countries.

5. That the naturalisation laws of the Empire be amended so as to prevent the abuses which have been disclosed since the commencement of the war.

6. That further legislation, especially in regard to enemy holdings in British companies or firms, is necessary to safeguard British subjects from the consequences of the policy of the German Government in organising its subjects residing in any part of the British Empire for commercial, industrial, financial and economic purposes in time of peace with a view to military aggression in time of war.

7. That His Majesty's Government be urged to guarantee for a period of years the continuance, by subsidy or otherwise, of new, or "key," industries established prior to and since the commencement of the war.

8. That with a view to promoting the development of British trade under altered conditions caused by the war, His Majesty's Government should appoint a Minister of Commerce of Cabinet rank, to whom certain of the functions of the Board of Trade and other departments should be relegated.

At the House of Commons last week Sir John Randles, M.P., presided over a meeting of the Commercial Committee. He said that he had accepted the invitation to attend the Congress of the International Commercial Committees of the Parliaments of Europe and Japan at the Sénat in Paris on the 6th, 7th and 8th March, to discuss the economical and commercial questions arising out of the war.

Platinum Prices.—According to an Ekaterinburg dispatch it is never easy to establish what the price of platinum is. No matter what the quotation may be in the Press, it is always understood by buyers that such price is rather nominal and is subject to negotiation. It was stated in a Petrograd paper a few weeks ago that, in view of the proposed platinum monopoly in Russia, the important platinum producers have begun to force up the prices considerably, in order that the platinum which they controlled, amounting to about 300 poods, might be disposed of to the Government on a basis satisfactory to them. The price of platinum, which not long ago was eight roubles per zolotnik, had rapidly risen to 11 to 12, and even more, roubles. Business generally in the Urals in platinum is doing somewhat better than immediately before the war. At Nizhni-Tura, buyers are offering 10 roubles for the crude platinum, and will buy any quantity. Before the war the highest price was nine roubles 80 copecks. At the mines there is some scarcity of labour owing to the high prices that it obtains elsewhere.

Goods of Enemy Origin.—The Board of Trade has issued a warning to importers stating that they are under an obligation to take all necessary steps to satisfy themselves that goods they propose to import are not of enemy origin. Failing evidence that they have done so, the goods, should they prove, as a result of examination on arrival, to be of enemy origin, will be liable to seizure even though accompanied by Consular certificates of origin. Importers who are offered goods (especially goods hitherto mainly derived from enemy countries) by firms abroad respecting which they have insufficient information are strongly advised to defer payment until the goods are delivered, and to make it a condition of payment that the goods are not only accompanied by certificates of origin in proper form, but are passed on arrival by the Customs authorities of the United Kingdom.

Australia and Future Trade.—Reuter reports that on January 13th, at Melbourne, the Associated Chambers of Manufacturers presented to Mr. Hughes (Federal Prime Minister) a series of resolutions framed with the object of preventing Germans from regaining their trade after the war. Mr. Hughes, in replying, said it would be incredible folly if victory secured on the field should leave Germany in possession of economic opportunities. The war must be carried on in the field of industry with a determination equal to that shown by the Allies on the field of battle. The Premier added that he was not in favour of trade with Germany "during the war, after the war, or at any other time."

Trade with Hong-Kong.—The Board of Trade is notified by the Colonial Office that, according to telegraphic information from the Governor of Hong-Kong, complaints are being received there that some merchants in the United Kingdom are declining to complete or undertake orders from Hong-Kong merchants on the ground that such merchants are not on the white list of persons and bodies of persons to whom articles to be exported to China may be consigned under the terms of the Proclamation of September 24th, 1915. It should be noted, however, that the Proclamation referred to does not apply to Hong-Kong; Hong-Kong is not affected by the white list regulations.

Petroleum Economies in Russia.—On the basis of the information submitted by the 1886 Company on the quantity of current supplied to the town mains from the Bogorod station, the Moscow Town Council has determined that on the average the company may use the current of the "Elektropredachi" concern to the extent of one-fifth of the total consumption of the town, which would mean an economy for the town station of 88,000 poods of petroleum. The cost price of the current for the town station from the 1886 Company is fixed at 3.3 copecks per k.w., and from the "Elektropredachi" at 2.9 c. The difference in favour of the company per month works out at an average of 10,000 roubles.

"Key" Industries.—The "Times" states that it is understood that the Advisory Committee of the Board of Trade have practically finished a report on "Key" industries—trades without which industries of national importance cannot be maintained. Our contemporary remarks: "The publication of this interesting and important document may be expected shortly. Its contents may be unpalatable to many, but there can be no question that the public ought to know exactly what these business men have told the Board of Trade. Rugged facts are of more importance than polished sentences in our present position."

In a fuller statement on the matter appearing in the "Times" of Wednesday, it is understood that the Advisory Committee in their report advocate Government subsidies for certain industries, while protection by tariff is also approved by overwhelming majorities. Electrical apparatus and porcelain are among the trades concerned. A section of the report is stated to be devoted to the great need for scientific training and research.

Women in Power Stations.—Owing to increased business and to decreased staff, both due to the war, the Glasgow Electricity Department is experimentally employing women in power and sub-station work for record-taking and switch-gear manipulation.

Enemy Capital Holdings.—The "Financial News" prints a copy of a circular which has been issued to the secretaries of all companies by the Registrar of Joint Stock Companies asking for information of an important nature. A form is enclosed whereon the recipient has to fill in, within a week, the name of the company and the nature of the business, together with the amount of capital in the company held by persons resident in foreign countries, separating, according to various countries, the capital so held.

Australia and German Shareholders.—Reuter's Melbourne correspondent reports Mr. Hughes, the Prime Minister, as saying at a banquet organised by the Metal Exchange, that the war was not only for national but for commercial supremacy. He had notified every company incorporated in Australia to wipe out within three months their German shareholders, whether naturalised or not.

Mr. Hughes leaves for England this month.

Prohibited Exports from France.—The French Government has issued an order prohibiting the exportation from that country of magnetos, accumulators, and battery plates.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Salaries in Power Stations.

So "Chief Assistant," writing in the REVIEW of January 7th, wants to saddle that sorely-tried gentleman, the Minister of Munitions, with some work that he might have done for himself years ago. He wants an adequate living wage and a guarantee that only competent engineers will be employed in electrical power stations. "Chief Assistant" grumbles that the Institution of Electrical Engineers, the Home Office, and Board of Trade have done nothing to help him, but he *hopes* that he will not be overlooked by the Minister of Munitions. Always it seems that a large majority of station engineers expect and wait for some other body to do for them what they can do for themselves.

The managers of the electric supply undertakings do not wait for the I.E.E., the Board of Trade, or the Minister of Munitions to help them; they organise themselves into very strong and formidable associations (quite apart from the Institution, of which most of them are also members) to deal with questions directly concerning them as individuals, to promote or oppose legislation, and generally to look after their own interests. For instance, quite recently there was a little healthy competition amongst the managers for charge engineers and switch-board attendants on account of enlistments, and others leaving to do munition work; salaries had a tendency to rise, and managers either objected to this or thought that, perhaps, the efficiency of their stations might become impaired—it matters little which. This competition was soon stopped by the managers coming to an agreement, though their Association, not to employ each other's charge engineers, etc. without mutual permission. The Munitions of War Act did not apply to the staffs of electrical stations, though the idea was borrowed from Section 7 of the Act. What is good for the managers is better for the staffs under them, and station engineers must follow the lead of their managers and build up a strong and formidable association.

There is at present a great deal of unrest in power stations all over the country. Station engineers' salaries have remained practically stationary, and there is little or no opportunity of bettering their positions by going elsewhere. The limit to the number of these allowed to join the fighting forces of the

country has been reached—in fact, I might say, exceeded, as men are being released from military service to take up duties in new stations, and some in old ones.

The cause of the unrest in stations (of which "Chief Assistant's" letter is only a slight indication), besides the greatly increased price of commodities, is due partly to outside influences. Nearly every other section of employees in the engineering industry, with the exception, perhaps, of the technical assistants and draughtsmen, has obtained substantial increases in wages, combined with a great deal of overtime.

The junior technical men are the backbone of the engineering industry. They now know it, and they have been ignored by those who are profiting by their energy and zeal. It is easier to withstand a blow than to be ignored; the other sections of the industry cannot be ignored because of their organised strength.

Electricity supply engineers have no excuse, for since January, 1915, there has been an opportunity open to them to help themselves. The Association of Electrical Station Engineers was formed with the avowed object of obtaining better pay and conditions for electricity supply engineers.

If "Chief Assistant" is really serious in advocating an adequate living wage and the employment of competent men only in stations, and is willing to help forward the movement, I can assure him that there is plenty of work before him and any others who care to take the matter up. If electricity supply engineers expect to obtain real assistance from some other source than themselves they are doomed to disappointment.

The Munitions Department has agreed to see that standard rates are paid in all "controlled establishments," and there is no difficulty in getting other Government departments to see that their contractors pay the same. The fixing of agreed rates must be the work of employers' and employees' associations; the question of competency for any particular position is a difficult question, and to tackle it properly some such arrangement must be made as is applied at present to marine engineers. This would mean that legislation would have to be promoted and would entail a large amount of work, and it would cost a deal of money. The work could only be done and the money supplied by an association of the men concerned.

I feel certain that every station engineer knows in his own mind that a strong association is the only solution of the present situation, and I often wonder why so many stand apart and will not help.

The A.E.S.E. still exists, after three years, in spite of adverse circumstances, and has, after much controversy, formulated a definite policy. In various districts where there is a large membership, conditions and wages have been improved by negotiation direct, the Association having on one occasion only to ask the services of the Chief Industrial Commissioner. The whole of the work connected with it is voluntary; there are no paid officials whatever. A monthly journal is issued to members (the work in connection with which is also voluntary), and the Association is anxious to have the help of all in the industry. Those willing to take an active part in the work are wanted more than ever as the Association grows. The subscription is small—10s. 6d. annually—which can be paid half-yearly or monthly as desired. The official policy of the Association is not to resort to strikes, but to make every reasonable application, either by letter or deputation, to attain its objects. Should such efforts fail to obtain satisfaction within six months, then the Association reserves to itself the right to use any methods it thinks proper to enforce arbitration on the questions concerned.

If you approve, join the Association; if you disapprove, join also, and improve it—don't let apathy prevent you from taking any interest whatever. Follow the lead of your managers and build up a strong Association.

W. J. Ebben.

Hon. General Secretary, A.E.S.E.

Leyton, E., January 10th, 1916.

[We regret that we have been obliged to condense Mr. Ebben's lengthy communication.—Eds. Elec. Rev.]

Electric Engine Starters for Industrial Motor Vehicles.—Since the fitting of an electric engine starting outfit on American pleasure cars became general, there has been considerable discussion as to the advisability of adding such equipment to industrial motor vehicles. An interesting contribution to the subject has just come to hand from the United States, where the engineering department of the Reo Motor Truck Co., of Lansing, Mich., recently carried out a series of experiments with its new 15-cwt. petrol motor delivery van. It is stated that the results obtained go to show that an engine starting outfit will more than repay its first cost in the saving of petrol effected during the first year of its use, owing to the engine being stopped instead of allowed to idle running. Finally, it may be stated that, as a result of the tests, it has been decided to adopt an electric engine starting set as a standard part of the equipment of the Reo vehicles.

BUSINESS NOTES.

Consular Notes.—BRAZIL.—Considerable extension in the use of electricity in Pernambuco is forehanded by the American Consul in that town. The Pernambuco Tramways and Power Co., which some 16 months ago substituted the present electrical system for the long-used mule car system, propose to install an electric light plant. At present trolley wires are extensively tapped to provide street and store lighting. Additional power is also likely to be required for running the elevators in the many new business blocks building or proposed.

CUBA.—According to a recent American Consular report the business outlook in Cuba is very good. Prosperity is especially marked in the sugar trade, and many companies have taken advantage of the present good prices and easily obtained money to replace antiquated machinery with more modern equipment. The quantity of new sugar machinery, which is stated to be all coming from the United States, is referred to as "tremendous." Indications are that more equipment will be purchased during the coming year, the newer mills forcing the older ones, in self defence, to bring their equipment up-to-date. Rumours of new organisations to go into sugar-making may also be heard.

MEXICO.—The American Consul at Chihuahua reports that the power plant of the Cia. Agricola y de Fuerza Electrica at La Boquilla, near Santa Rosalia, Chihuahua, has now been completed and the current made available for use at Parral, in the operation of the cyanide ore treatment plant of a mining company. The current was turned on through the transformer station at Parral on September 28th. At present only 1,000 H.P. is being used.

MANCHURIA.—The American Consul at Harbin, China, quoting the *Norvosti Zhivni*, of October 21st, states that a British firm has made arrangements for establishing an electrical plant at Station Handashedu on the Chinese Eastern Railway, about 170 miles east of Harbin. The capacity of the plant will be sufficient to provide several thousand consumers with electricity and to light the streets of the village.

Book Notices.—Diesel Engines for Land and Marine Work. By A. P. Chalkley, B.Sc. Fourth edition. London: Constable & Co. Price 8s. 6d. net.—Owing to the rapid progress in the evolution of the Diesel engine, this work, although first issued at the end of 1911, has been completely revised for the second time in four years. The new material is found mainly in the section dealing with Diesel engines for marine work, a direction in which much work is being done; the illustrations have been nearly doubled in number, new types are described, and an additional chapter on the design of Diesel engines has been inserted. The makers and users of this type of prime mover are fortunate in having at their service so comprehensive and so well illustrated a work on this subject, which occupies a special place in oil engine practice—as is indicated by the fact that an association of users of Diesel engines has been formed to discuss their peculiarities of construction and working. "The Diesel engine," says the author, "is perhaps the most scientifically designed motor in existence," requiring great exactitude in construction and the utmost care in erection, though once in operation it becomes a machine of the greatest reliability. Useful chapters on installing, running and testing the engine are included, and some interesting estimates of initial and working costs, based upon actual installations, are given.

A Text-book of Paper-Making. By C. F. Cross and E. J. Bevan. London: E. & F. N. Spon, Ltd. Price 15s. Fourth edition.—However interesting the details of the art of making paper to those engaged upon it, we cannot suppose that the average electrical engineering reader has leisure to study it except in so far as his profession brings him into contact with it. The points of contact may be multiplied as time goes on, but at present they are few in number, though of considerable importance; they include the electric lighting and driving of the paper mills, the electrolytic bleaching of the paper pulp, and the use of paper in various forms for the insulation of electric cables and apparatus generally, the last being, of course, by far the most important. It is curious that the authors hardly mention the lighting of a paper mill, although the necessity of judging colour correctly would seem to involve the use of electric lighting specially adapted for this purpose at certain stages of the process. A short section on electric power describes the distribution of electrical energy from a central power station to the motors driving the machinery as "the ideal conditions," to which the older mills are being converted. Steam is required for so many purposes in paper mills that the method of using it first in a turbine and afterwards for the manufacturing processes becomes very economical and convenient, and is highly recommended. As regards the third point of contact above-mentioned, the book will be of especial interest to cable-makers and other users of high-class papers, who, as was made evident in the proceedings of the I.E.E. some years ago, have found it necessary to study the constitution of their paper very closely. The book is extremely well printed and illustrated, and, needless to say, is printed on excellent paper.

The Electrical Engineer's Diary. S. Davis & Co. Price 3s. 6d.—This year the Diary is issued in two forms, bound in stiff boards and limp covers respectively. In addition to the usual mass of information which it contains, the following are new features:—A section dealing with industrial lighting in a highly instructive manner; a section on electrical cooking and heating, by Mr. R. S. Downe; a table showing the local lighting hours for every day in the year at 30 important centres in the British Isles. Other additions have been made, and the very useful lists of streets in the metropolitan area in which electricity supply

is available have been extended to include certain outlying districts. It is a very useful production.

Willing's Press Guide (125, Strand, W.C.), is, as we have said before, a most handy publication for all who want the names, addresses, and a few other particulars, of newspapers, magazines, &c., conveniently arranged. It has reached its 43rd year, and continues to give full value for the money—1s.

Hazell's Annual for 1916 (Hazell, Watson and Viney, Ltd. London: 3s. 6d. net) will hold the prominent place that its length and efficient record has made for it among the useful annuals which contain so much information that one requires to have at hand. This time it has, among other matters, a complete list of recipients of the Victoria Cross and a Roll of Honour of some hundreds of names of those who, in high circles, have sacrificed themselves in their country's cause during the past year. Statistical information regarding the Colonies and foreign countries, 10 pages devoted to aviation matters, and 20 relating to naval affairs, are given, in addition to the numerous sections dealing with trade, finance, shipping, railways, and so forth.

A copy of the *British Dominions Year Book*, 1916, has been received. It is published by the British Dominions General Insurance Co., Ltd., 1, Royal Exchange Avenue, E.C., and edited by Messrs. E. Salmon and J. Worsfold. It contains a wealth of matter regarding the affairs of the Empire, the Army and the Navy, the war, with maps, badges of rank in colour—indeed, in a few lines it is impossible to indicate the wide scope of the contents. In addition to all this general information, there are articles by many well-known writers, including one by Sir Leo Chiozza Money, M.P., on "A Business-like Empire"; one by Cyril M. Picciotto on "International Law in the Present War"; one on "British Opportunities in Russia," by Louis A. Rojansky; one on "The Economic Outlook for Germany"; and others on science and trade organisation, trade in war-time, and so on. The book is not on sale, but is for presentation purposes.

Colliery Manager's Pocket-Book for 1916. Edited by H. Greenwell. London: The Colliery Guardian Co., Ltd. Price 2s. net.—According to the statistics given in this handbook in 1914 electricity was employed in 1,428 mines (a reduction of 42) to a total of 713,782 H.P., compared with 628,098 in 1913; of this 294,092 H.P. was on the surface, and 419,690 H.P. underground, being used mainly for hauling and pumping. There were four types of electric safety lamps in extended use and five others in small numbers, the total being 75,707 in 1914, compared with 37,823 in 1913—a very notable advance; magnetic locking was employed in 61,772 cases, and lead rivets in 13,787. The electrical section of the book consists mainly of the official memoranda relating to the regulations, and contains too little general information to be of much use; we should think that, in view of the increasingly important part played by electricity in mining nowadays, the section might be greatly increased with advantage. The pocket-book appears to be indispensable to the colliery manager.

The Practical Electrician's Pocket-Book and Diary for 1916. Edited by H. T. Crewe. London: S. Rantall & Co. Price 1s. net.—This is now in its 17th edition; by condensation and the omission of obsolete matter, room has been made for new sections dealing with electric pumping plant, drills, blowers, and lifting magnets, telephones and shaft signals, bells and indicators, and battery vehicles. It is a useful little book.

The Christmas number of the *Wileroid* (the journal of the Willenden Works employees of the British Thomson-Houston Co., Ltd.) excels even its predecessor, the first issue of the journal, in interest and thoroughness. It contains lively articles from the front, a variety of essays of strictly local and professional bearing, and sundry miscellaneous items, many of which are very clever.

Lektrik Lighting Connections.—Messrs. A. P. Lundberg & Sons' well-known booklet (price 6d. net, 7d. post free), is now in its fourth edition and its 35th thousand; it occupies a field entirely its own, and must unquestionably be of great use to wiring contractors and wiremen. A lengthy list is given of the holders of certificates in the advanced grade of Messrs. Lundberg's examinations, and a new section on automobile controls has been inserted.

We have received a copy of Part I of "Russian Reading Made Easy," also one of "Russian Grammar Simplified." Both are issued by Hugo's Language Institute, Gracechurch Street, E.C.

"Post Office Electrical Engineers' Journal," Vol. VIII, part 4, January, 1916. London: H. Alabaster, Gatehouse & Co. Price 1s. net.

"Journal of the Institution of Electrical Engineers." Vol. LIV, No. 254, January 15th, 1916. London: E. & F. N. Spon, Ltd. Price 3s. 6d.—This issue contains Mr. J. E. Kingsbury's address to the Students' Section, and the following papers:—"Ignition of Explosive Gas Mixtures by Electric Sparks," by Mr. J. D. Moran; "Electric Heating," by Mr. G. Wilkinson; "Resistance of Heat-treated Copper-Zinc-Nickel-Alloys," by Mr. F. C. Thompson.

"Proceedings of the Physical Society." Vol. XXVIII, Part 1, December 15th, 1915. London: The Electrician Printing and Publishing Co. Price 4s. net.

"Journal of the South African I.E.E." Vol. XIV, No. 5, December, 1915. Johannesburg: The Institute. Price 2s.

"Spons' Architects' and Builders' Pocket Price Book for 1916." By C. Young and S. M. Brooks. London: E. & F. N. Spon, Ltd. Price 2s. 6d. net.

Meter Prices.—THE BASTIAN METER CO., LTD., announce that the high cost of labour, raw material, carriage, and other items, has compelled them to revert to pre-war prices for their Bastian meters. The reduction announced in July, 1914, is, therefore, no longer in force.

Catalogues and Calendars.—DIAMOND COAL CUTTER Co., Wakefield—Wall calendar with monthly date slips for 1916. MESSRS. PIRELLI, of 144, Queen Victoria Street, London, E.C., have sent us a calendar for the year with a block of daily date slips with bold figuring on a metal background. Above the block there is a most pleasing design in appropriate colouring, in which a Pirelli tire is speeding the flags of the Allies on to victory.

From MESSRS. JOHNSON & PHILLIPS, LTD., of Charlton, S.E., we have received a most welcome and handy vest-pocket diary and engagement book (black and gold) containing an income and large desk blotting pad with a diary interleaved with the blotting paper, also a block of spaces for daily engagements at the left hand side, while on the right there is a block of memoranda-slips.

THE NAVY EMPLOYMENT AGENCY, of 25, Victoria Street, S.W., have favoured us with one of their "Clyde" calendars with date indicator—a device which we have found most useful. The agency was founded for the purpose of finding employment for men of the Royal Navy and Marines on their leaving the Service, amongst its protégés are engineers and electricians. It is an admirable institution, and though at present, owing to the war, it has very few men on its books, it is hoped that on the termination of hostilities our readers will, as far as possible, give employment to the men who have so zealously guarded our shores.

MR. C. H. JEFFCOAT, 18, Runelagh Gardens, Hammersmith, London, W.—Illustrated leaflet relating to the "Lamlok" electric lamp-locking ring.

MESSRS. ALEX. HAWKINS & SONS, London Road, Southwark, S.E., have issued a small and attractive wall calendar for 1916 with a coloured print entitled "First Aid to the Injured," beneath which are small monthly date-slips.

MESSRS. AUSTIN WALTERS & SON, 57, Lower Mosley Street, Manchester.—20-page catalogue of "Signs for All Trades" showing a number of designs of electric signs for use outside café and restaurants, hotels and shops, garages and picture theatres; also a selection of artistic window signs, interior theatre signs, wood-letter signs, electric sign flashers, and electric time switches.

THE LIVERPOOL ELECTRIC CABLE CO., LTD., Bootle, Liverpool, have issued a serviceable wall calendar with a set of monthly date slips fixed beneath a bird's-eye view of the works.

HOSTON GEAR WORKS, Norfolk Downs (Quincy), Mass.—90 pp. illustrated pocket catalogue and price list of Boston gears.

MESSRS. LE CARBONE, 17, Water Lane, Great Tower Street, London, E.C.—Circular tabulating particulars and schedule of qualities of their carbon brushes for dynamos and motors.

Bankruptcy Proceedings.—HERBERT PAGE, electrical engineer, trading as Smeaton & Page, at 63, Queen Victoria Street, E.C., and residing at 32, Marlborough Road, Chiswick.—An application was made on January 11th, to Mr. Registrar Linklater, at the London Bankruptcy Court, for an order of discharge. Mr. Egerton S. Grey, Official Receiver, reported that the failure occurred in July, 1915; the bankrupt returned ranking liabilities amounting to £2,157, but the proved and provable debts totalled £2,292; the assets valued by the bankrupt at £176, had produced only £79, owing to the excessive value placed by the bankrupt on his office furniture, plant and stock-in-trade, which were subject to a claim for rent, and from which nothing could be recovered from the estate. A dividend of 6½d. in the £ had been paid on proofs of debt amounting to £2,232. The failure was attributed to loss on trading, excessive drawings, and interest on borrowed money. As offences the Official Receiver reported (1) insufficiency of assets to equal in value 10s. in the £ on the amount of the unsecured liabilities; (2) trading with knowledge of insolvency; and (3) a previous arrangement with creditors. His Honour upheld the report and suspended the discharge for two years. Order entered accordingly.

HARRY A. WEST, described as of 114, Chancery Lane, W.C.—At a sitting of the London Bankruptcy Court, held before Mr. Registrar Linklater, bankrupt applied for an order of discharge from proceedings instituted in September last. Mr. Egerton S. Grey, Official Receiver, reported that the proved and provable debts amounted to £1,015, and the assets had realised only 13s. 6d. The bankrupt was an insurance clerk with a salary of £370 per annum, and he was willing to set aside £75 a year for the benefit of the creditors. It appeared that in June, 1911, in order to set up his only son in business, the bankrupt purchased, for £175, the goodwill, stock and effects of an electrical engineer's business at 55, Old Dover Road, Blackheath, and his son being a minor, the bankrupt purchased the business in his own name. He was in debt to the extent of £100 at the time, and borrowed £175 with which to pay for the concern. The business was unsuccessful throughout, owing in a great measure to the mismanagement of the son. The bankrupt borrowed further sums from time to time for the purposes of the business, and eventually the lender sued him for repayment, obtained judgment, and made him bankrupt. The Official Receiver reported that the bankrupt had been guilty of misconduct in relation to his affairs by obtaining from the petitioning creditor an advance upon the security of a charge over a certain interest to which his son was entitled, without disclosing the fact that such interest was already mortgaged. Insufficiency of assets to equal 10s. in the £ on the amount of the unsecured liabilities was also reported by the Official Receiver, and Mr. E. W. Hansell, on behalf of the petitioning creditor, opposed the discharge on the ground that the bankrupt had entered a frivolous and vexatious defence to an action. Mr. Storrey Deans appeared for the bankrupt in support of the application, and consented to an order for his client to set aside £100

per annum for the benefit of his creditors. His Honour gave the bankrupt liberty to again apply to the Court regarding his discharge, when he had paid the creditors 10s. in the £. Order entered accordingly.

JAMES PROCTOR KYD CLARK, electrical and mechanical engineer, Hythe Road, Willesden Junction, N.W.—At the London Bankruptcy Court on January 12th, an application was made before Mr. Registrar Hope, for an order of discharge. Mr. E. Leadham Hough, Senior Official Receiver, reported that the applicant failed in March last, with provable debts £1,951, and no assets what ever. He traded from 1895 till November 4th, 1914, at first with a partner, but subsequently in 1903 by himself. In 1902 they appointed a gentleman, of whose estate the petitioning creditor became administrator, their selling agent in Russia, and he so acted until his death in September, 1910. Disputes afterwards arose between the petitioning creditor and the bankrupt on the accounts between the parties, with the result that an action was tried and judgment given against the bankrupt for £1,672, and costs taxed at £273. In November, 1914, the bankrupt transferred his business to his manager in consideration of £200 cash and an undertaking to discharge liabilities of the business to the extent of £732, but not the debt to the petitioning creditor. The assignment to the purchaser comprised stock taken over at the price of £911; stock and work in progress taken over at £360; office furniture, £50; book debts amounting to £1,408, and taken over at £909; cash, £34; the lease and goodwill of the business and many other assets for which nothing was paid by the purchaser. The Official Receiver submitted that the sale by the bankrupt of his business was not *bona fide* on his part, but was made for the purpose of depriving the petitioning creditor of the benefit of any judgment which he might recover against the bankrupt. As offences were alleged (1) insufficiency of assets to equal in value 10s. in the £1 on the amount of the unsecured liabilities; and (2) misconduct in having deputed himself of assets in order to defeat the petitioning creditor's claim. Mr. Tindale Davis appeared for the petitioning creditor, and the learned Registrar, in suspending the discharge for three years, remarked that it was clearly a case of wrong-headed vindictiveness on the part of the bankrupt.

G. J. T. J. PARFITT, consulting electrical engineer, Keynsham.—Application for debtor's discharge is to be heard, at Bristol, on February 25th.

WILLIAM CAREY WILD, electrical engineer, 57, Rhodes Street, Halifax, Yorks.—The public examination of the above debtor was held on January 14th, at the County Court House, Prescott Street, Halifax, when the liabilities were stated at £126, and the deficiency at £55. The debtor stated that two years ago he removed to larger premises, thereby increasing his expenses, but since the outbreak of war his trade had fallen off. The debtor was allowed to pass.—February 2nd is the last day for the receipt of proofs for dividend, by Mr. W. Durrance, Official Receiver, 12, Duke Street, Bradford.

Dissolutions and Liquidations.—ILKESTON MOTOR AND ELECTRICAL ENGINEERING CO., LTD.—This company is winding up voluntarily, with Mr. A. Boaler, of Nottingham, as liquidator.

EASTON & CO., LTD.—A meeting is called for February 15th, at 11, Ironmonger Lane, E.C., to hear an account of the winding up from the liquidator, Sir W. B. Peat.

EASTON, ANDERSON & GOLDEN, LTD.—A meeting is called for February 15th, at 11, Ironmonger Lane, E.C., to hear an account of the winding up from the liquidator, Sir W. B. Peat.

CROOY MAGNETO CO., LTD.—Mr. E. H. Hawkins, 4, Charterhouse Square, E.C., has been appointed liquidator, to act jointly with Mr. W. G. Newman.

ROYLE ENGINEERING CO., engineers, Croydon.—Messrs. H. W. Robinson and C. L. Lloyd have dissolved partnership. Mr. Robinson will attend to debts.

Electric-Light Switching Competition.—MESSRS. A. P. LUNDBERG & SONS, of 477-489, Liverpool Road, London, N., inform us that their next competition or examination will be held next month. Full particulars, including the problems, may be had on application to them, no charge being made. We have, on various previous occasions, commented on the practical nature of the subject dealt with, and most of our readers will have noticed the periodical announcements of "results" in this Journal. Those who are still more or less in the dark as to what it is all about should find full enlightenment in the aforementioned "particulars." These will be sent to overseas applicants, as well as to those at home.

For Sale.—The Dunfermline Co-operative Society has for disposal its present power station plant and motor equipment, consisting of two 7½-kw. sets, direct-coupled Belliss & Morcom engine and Crompton generator, switchboards and instruments, Babcock boiler, feed pump, &c.; also 10 motors, from 2 to 30 H.P.

The L.C.C. invites tenders for the purchase of one 3,500-kw. steam alternator, 6,600 volts, 25 periods per second; the set consists of two engines, one on each side of alternator, complete with condenser and air pump. Halifax Corporation has for sale two 200-kw. Parsons D.C. turbo-generators and three 100-kw. E.C.C. rotary converters. See our advertisement pages to-day.

Trade Announcement.—THE WILSON APPARATUS CO. announce that their business is now being carried on under the style of the "Globe Radio-Apparatus Co." with head office at 18, Old Broad Street, London, E.C., where all communications should be sent. For the present the works address will remain at Finchley Lane, Hendon, N.W.

Social.—On Friday, January 7th, the FOSTER ENGINEERING CO., LTD., held their annual fancy dress dance at the Masonic Hall, Wimbledon, S.W. About 180 persons were present, all, with about six exceptions, being in costume. A series of topical verses were set to a well-known tune by Mr. Lazenby, a director of the company. After supper the prizes were presented by Mrs. Lazenby.

Patent Restoration.—Letters Patent No. 9,339, of 1900, granted to G. de Bouché and R. W. Rücker, for "Improvements relating to the treatment of complex sulphate ores," has been granted.

Board of Trade Inquiries.—Recent inquiries received by the B. of T. Commercial Intelligence Branch are for names of British makers of the following:—Celluloid, suitable for accumulator cells; electric pocket lamps and bulbs; centrifugal pumps, made in lead, for pumping acid.

LIGHTING AND POWER NOTES.

Barnsley.—**STREET LIGHTING.**—The Electricity Committee has decided to restore half-lighting throughout the borough.

Brierfield.—The L.G.B. has refused to authorise the borrowing of further capital moneys for the electric lighting undertaking under the sanction previously given.

Burton-on-Trent.—**PRICE INCREASE.**—The T.C. has been informed that there would shortly be a revision of the electricity charges, both for lighting and power, owing to the increasing cost of fuel. It was anticipated that by March next the increased cost would amount to £2,000.

Canada.—By the purchase of the Gies Falls power site and the recent agreement with the Laurentide Power Co., the Shawinigan Water and Power Co. will practically control the most important water developments on the St. Maurice River, and will possess, it is stated, one of the greatest aggregations of power resources under one control in the world. The storage dam now being constructed at the mouth of the Manouan River will considerably increase the water facilities of the Shawinigan Co. The Gies Falls are about four miles below Shawinigan, and are capable of developing between 60,000 to 75,000 H.P.

Last month the Hydro-Electric Power Commission of Ontario placed in operation the generating plant at Eugenia Falls, on the Beaver River, 30 miles from Owen Sound, the installation consisting of two 2,250-H.P. Escher-Wyss turbines coupled to 1,200-K.V.A. generators. Power is generated at 4,000 volts and stepped up to 22,000 volts for distribution to Owen Sound, Shelburne, Durham and Mount Forest. The load on the first day of operation reached 856 kw., and at the present time 1,500 kw. represents the daily maximum requirements.—*Canadian Electrical News.*

Ceylon.—The final taking over of the plant and consumers by Government, from the Board of Improvement, Nuwara Eliya, the mountain capital of Ceylon, was to be effected on January 1st, 1916. The new generator and turbine, which were landed during the middle of the year, have now been erected; they were tested recently and are working satisfactorily. The question of lighting has been deferred.—*Indian Engineering.*

Chippenham.—**STREET LIGHTING.**—The T.C. has decided to call upon the Electricity Co. to complete the contract for the public lighting at Lowden without further delay.

Continental.—**ITALY.**—A grant of water on the River Verdura, with a view to the construction of a hydroelectric station and irrigation works, has been sanctioned by the Prefect of the Province of Girgenti, at the instance of the engineer, Giuseppe Patane, of Catania.

Downham Market.—**PROPOSED E.L.**—The local gas company has offered to obtain the necessary powers to supply electricity if wanted in the area. The Council is negotiating with Mr. Best, of Bradford, in regard to such a scheme.

Durham.—During the recent gale a large steel tower at the electric station, Yerrington Lane (County Durham), was blown down. The station stands close to the North-Eastern Railway Co.'s main line between Spennymoor and Ferryhill, and the structure which came down was about 80 ft. high. It just missed the railway by a few yards, whilst an adjoining signal cabin narrowly escaped.

Glasgow.—**NEW PLANT.**—At the last meeting of the Electricity Committee the engineer submitted a report relating to the existing generating plant, from which it appeared that he had only managed to meet the demands made for electricity during the winter by overloading the generating plant at the Port-Dundas and St. Andrew's Cross stations, and by taking 3,600 H.P. from the Pinkston generating station of the tramways department; that he had still to connect three large factories, which are to be used later for the manufacture of engineering material; and that the margin of power for supply provided by the exist-

ing generating plant is much too small. The Committee, after considering its report, was of opinion that additional plant ought to be ordered without delay, and agreed to recommend that tenders for two 6,000-kw. turbo-alternator sets be obtained and submitted for consideration.

Gloucester.—The Electricity and Light Railways Committee reports that for November the output of electricity was 209,511 units against 187,009 in the corresponding period of last year. On the light railways for the six weeks ended December 29th, the receipts showed a decrease of £18 compared with last year, due mainly to increased wages.

Hereford.—**LOAN REFUSED.**—The L.G.B., in response to a repeated application for sanction to a loan for the provision of additional plant at the electricity works, has again refused, on the ground that the provision of additional plant at the present time is not a matter of pressing necessity, either on the grounds of public health or on account of war requirements. Under these circumstances no applications for new supplies or for the extension of any existing supply will be entertained. The sum required is from £8,000 to £10,000.

Horbury.—The U.D.C. has consented to the use of overhead lines in the district by the Yorkshire Electric Power Co., subject to the substitution of underground cables across Duddle Lane on receipt of six months' notice, and the company has accepted the condition.

London.—**ST. MARYLEBONE.**—The L.C.C. has sanctioned the borrowing of £3,800 for electricity mains and services. The Electricity Committee recommends that the charge to the Port of London Authority for the hire of two spare sets of 500-kw. turbines for cold storage purposes be £20 per week.

The Committee recommends the Council to protest against the Government introducing measures to effect the pooling of private-owned railway wagons, as the supply of coal to the electricity works would be made more difficult.

The revenue account of the Council's electricity undertaking for the September quarter, 1915, shows a gross revenue of £33,811, and expenditure £19,174, leaving a balance of £14,637 available for loan and special charges, an improvement of £347 compared with the corresponding period of 1914. The number of units sold shows a decrease of 5.9 per cent.; during the June quarter the decrease was at the rate of 9.6 per cent., and the improvement during the September quarter has reduced the diminution of sales over the half year to September 30th, to 7.93 per cent. on the 1914 totals. Since September 30th the daily output returns, with few exceptions, show a marked increase over the corresponding days of last year, the cumulative effect of which is to reduce the above percentages of 9.6 and 7.93 to about 3 per cent. for the portion of the financial year to date. The generation expenses were £7,581, as compared with £6,584 and £7,546 for the corresponding periods of 1914 and 1913 respectively. The average price paid for coal during the quarter was 20s. 2d., as compared with 14s. last year. The improvement in trading and the higher prices obtained, have enabled the enhanced coal prices, £1,705, to be met, the cost of allowances granted to employés on national service, £994, the cost of guarding the works, £123, and the extra cost of materials generally, and to leave a balance larger than last September by £347 to meet the capital and special charges for the year ending March next.

SOUTHWARK.—The accounts of the Borough Council's electricity undertaking for the year ended March 31st, 1915, show a deficit of £6,410.

POPLAR.—According to the report of Mr. Bowden, chief electrical engineer to the B.C., the net surplus on the electricity undertaking for the September quarter was £2,071, as against £1,286 for the June quarter, making a total for the half-year of £3,358. This figure compares with £2,408 for the corresponding period last year, and therefore shows an increase of £950. Mr. Bowden adds that on account of increased prices £2,835 extra was paid for coal; that the revenue was reduced by £600, owing to the Stepney Council not taking a stand-by supply this year; and that other extras paid amounted to £436, while the reduction in lighting rates represented a reduction of over £500 in revenue, in view of which the result is a remarkable one.

HAMMERSMITH.—**STREET LIGHTING.**—The Special Committee appointed to consider the question of the allowance to be made by the Electricity Committee in consequence of the restricted public lighting, recommends that £2,500 be deducted for the financial year ending March 31st next, and that an allowance at the same rate per annum be made subsequent and until otherwise ordered by the Council.

BERMONDSEY.—Having regard to the fact that the loans for meters, ordinary mains and for services have been overspent to the extent of £1,610, the B.C. is recommended to apply to the L.C.C. for sanction to, and the advance of, a further loan of £3,000.

FULHAM.—The Law and Parliamentary Committee recently claimed £875 from the coal contractors for loss occasioned by non-delivery of coal; the matter has now been settled by the contractors agreeing to reduce their account from £629 to £500, and to release their bonds.

PRESSURE TESTING STATIONS.—The Hammersmith Council at its last meeting decided to support the suggestion of the Hackney B.C. that the periodical inspection of pressure testing stations carried out by the L.C.C. should be suspended during the war. The Electricity Committee considers that the undertakings might be saved the testing fees and the services of the official be rendered available for work of a more useful character.

King's Lynn.—**PRICE INCREASE.**—Owing to the increased cost of fuel, &c., the T.C. has advanced the charges for current for power by another 5 per cent.

Luddenden Foot.—A conference is to be held between the chairman of the U.D.C. and the borough electrical engineer of Halifax in regard to the supply of electricity.

Middlesbrough.—Fire broke out in the generating plant at Nunthorpe Hall recently, and before the arrival of the Middlesbrough fire brigade, £200 worth of damage was done.

According to Mr. R. H. Scotson, borough electrical engineer, the total estimated revenue of the electricity department for December was £3,268 as against £3,204 for December of the previous year, and the total estimated profit for the month was £2,069, compared with £1,857. An inquiry in regard to an explosion at an electricity manhole was left by the T.C. with the borough engineer and the engineer to the Post Office, whose main was concerned.

Mirfield.—The U.D.C. has applied to the B. of T. for consent to use overhead transmission, at 200 volts, for the purpose of supply under the order of 1899.

Newport (Mon.).—The Electricity and Tramway Committee reports that the Gas Co. demanded that an inquiry should be held by the L.G.B. on the question of the supply of electricity to Maesglas, which is outside the borough. The inquiry was held last week, with the result that the B. of T. has intimated that electricity should be supplied to the new works.

Northallerton.—**STREET LIGHTING.**—It was reported to the U.D.C. that owing to restricted lighting, the street E.L. account for the past quarter amounted to only £46 against £178 in the corresponding period of last year.

Pendlebury.—A generating plant is being provided at the Acme spinning mill to provide power for driving that mill and the adjoining Albion mill. The Acme mill was the first spinning mill in Lancashire to be electrically driven.

Perth.—The electricity department came to the assistance of the city the other day on the occasion of a breakdown at the gasworks. In connection with the matter, Mr. J. Lambert, Corporation electrical engineer, has been asked to report upon the whole of the electric appliances in use at the gasworks, and advise specially as to the obtaining of duplicates to replace any parts that may go temporarily out of order or may be worn out.

Slaitwaite.—**PROV. ORDER.**—The U.D.C. has decided to apply for the date of the electricity order to be extended for a period of 12 months after the end of the war.

Southend-on-Sea.—The T.C. is recommended to arrange for the installation of a new automatic electric starting apparatus for the sewage pump in Hamstel Road. Messrs. Callender have written the Electricity Committee asking it to take delivery and pay for the cable ordered in connection with the proposed supply of current in the Leigh area, the delivery and payment having been delayed in compliance with the L.G.B. embargo on capital expenditure. In view of the largely increased price, which it would probably have to pay for the cable at a later date, the Committee has resolved to authorise the clerk to inform Messrs. Callender that the Council will take delivery of and pay for the cable in April next. The Committee decided that in the event of the Corporation being permitted by the L.G.B. to install one or more of the engines in the Leigh sub-station, application be made to the Board for authority to raise the cost of the cable under the sanction of December, 1914, authorising a loan of £18,000 for cables, &c. (the cost of the cable in question being included in such application), and that in the event of the Corporation not being permitted to equip the sub-station the cost of the cable be paid out of revenue.

Sowerby (Thirsk).—**STREET LIGHTING.**—The Electric Lighting Co. has offered an allowance of £30 off the lighting account providing there is no alteration in the lighting conditions. It was pointed out that the contract was for three years, subject to the amount being allowed by the parish meeting, and the amount the meeting would have been asked to raise for the current year was £105. It was agreed to accept the company's offer.

Surbiton.—**E.L. TRANSFER.**—The U.D.C. has now received the sanction of the B. of T. for the transfer of the E.L. undertaking to Messrs. Callenders.

Swindon.—The T.C., having received an application for a supply of current to Broome Manor, for lighting and power, has referred the matter to the Electricity Sub-Committee. To comply with the request the overhead line will have to be extended from Broome sewage works, at an estimated cost of £275.

Swinton and Pendlebury.—The D.C. has decided that the agreement with the Lancashire Electric Power Co. for the supply of electricity shall be extended to the year 1923. It is stated that the effect of this will be to lower the price of current to the Council.

West Bromwich.—The T.C. has entered into an agreement with the Oriental Tube Co., Ltd., to supply a minimum of 80,000 units per annum for a period of years.

Wolverhampton.—**PROPOSED LOAN.**—The Corporation proposes to borrow £1,780 for main extensions in connection with the supply of electrical energy to local works.

TRAMWAY and RAILWAY NOTES.

Ashton-under-Lyne.—**WAGE INCREASE.**—As the result of the recent arbitration between the Corporation and the tramway employes, increases of wages have been awarded to the men as follows:—Motormen and conductors receive an increase of $\frac{1}{4}$ d. per hour, and shedmen $\frac{1}{4}$ d. per hour, the increases to date from October 4th. The motormen and conductors working on the Manchester section receive the following increases for the duration of the war:—1s. per week to employes up to 21 years of age, and 2s. per week to those above that age. The wages of inspectors were increased by 1s. 6d. per week.

Birmingham.—**FEMALE LABOUR.**—The Tramways Committee reports that there were now 700 women acting as conductors on cars in the city, and, generally, their work gives satisfaction. About 50 professional and business men are acting as motormen on cars during the week-ends.

Bolton.—**FEMALE LABOUR.**—The Tramways Committee has authorised the tramways manager to employ as many women car conductors as he deems necessary, and it has been decided to adopt a uniform similar to that used by the women conductors at Oldham.

Chesterfield.—The T.C. has decided to apply for the tramways undertaking to be a "controlled" establishment. An application for the women tramway conductors to be paid the war bonus given to male employes, has not been granted, as they commenced duties after the outbreak of war at the maximum rate of pay.

Continental.—**SPAIN.**—**RAILWAY ELECTRIFICATION.**—The establishment of interurban electrical railways in Spain is hindered by unfavourable geographical conditions. The country consists for the most part of a lofty plain, sparsely populated, sloping towards the coast, and the railway network in conjunction with the cart roads suffices for the insignificant traffic. Only on the coast, which is thickly populated, are there interurban railways. According to the report of a German engineer, Herr W. Reinart, in the *Elektrische Kraft und Betriebe*, the greater part of these, some 15 lines, with a total work length of 295 km., are of 1 metre gauge. One of these railways, running from Pampeluna to Sanguesa, 18 km., is worked by single-phase current, at 6,000 volts and 25 cycles; all the others employ continuous current at 500-600 volts, with the exception of the Viga-Mondariz line, 42 km. in extent, which is still under construction, and which will employ continuous current at 1,200 volts. Another line intended for working with continuous current at the same pressure, the Barcelona-Sabadell-Tarasa, is now under construction; and three lines running out of Bilbao, of an aggregate length of 80 km., will work with current at 500-600 volts. Of ordinary electric railway lines the Gergal-Santafé-Mondigur (near Almería), with a gauge of 1.66 m., is the only one in use. It is engaged almost wholly in the transport of ore on a gradient, and with a view to utilising regenerative methods, the three-phase system has been chosen. The trains are drawn by two locomotives of 52 tons weight each, with two 160-H.P. motors each. A more important long-distance line, whose electrification was under consideration just before the outbreak of the war, is that which connects Huelva with the famous Rio Tinto copper mine; this line, devoted almost exclusively to the carriage of ore, is 80 km. long, and has a gauge of 1.30 m. For its working it is intended to use three-phase current at 3,000 volts and 50 periods; the locomotives are fitted with two motors of 600 H.P. each. A Commission nominated by the Spanish Government is at the present moment occupied with a scheme for an express electric line from Madrid to the French frontier, whose termination will probably be at the new Somport tunnel, which passes through the Pyrenees.—*Revista Técnica d'Electricità.*

ITALY.—The Società Anonima dei Tramways Florentine has applied for authority to build and work new electric tramways from a point in the city to La Lastra.

Application has been made for a concession for the construction and working of a short line of metre-gauge electric tramway to connect the town of Todi with the Todi-Porte Nara railway station.

SWITZERLAND.—The Swiss State Railway authorities have decided to commence the work of electrifying the Gothard Railway, a start being made with the Erstfeld-Bellinzona section of the line. For the current year provision has been made for the expenditure of £120,000 on the work; of this, £56,000 is for the Amsteg power station, £52,000 for the Ridom station, and £12,000 for rolling stock and the construction of a short trial section. The provisional estimates provide for the expenditure of £380,000 in 1917, £540,000 in 1918, £440,000 in 1919, and £60,000 in 1920, the total cost being thus £1,540,000.

Dudley.—**TRAMWAY ACCIDENT.**—On Sunday evening last a serious tramway accident occurred on the Dudley-Wednesbury route, owing to a car carrying 30 passengers running away down hill, without the driver, and subsequently jumping the points and overturning across a footpath. Sixteen passengers were injured, and one of these has since died of injuries received. Apparently the car was at a terminus which was on a slight gradient, and, the brakes having been applied, the driver went to meet a Birmingham car, by which his tea was sent up. The conductor, who remained on the car, changed the trolley-pole, and,

thinking the driver was at his post, rang the bell and released the brakes. The car then started, and he commenced to take fares, being unaware of the position of things until his attention was drawn to the matter by a passenger; his subsequent efforts to apply the brakes were too late, as the car left the track and overturned, as mentioned. This accident resembles very closely that which occurred at Barnsley on December 2nd, 1914, and on which Col. von Donop subsequently reported, his findings being given in our issue of February 5th last year.

Edinburgh.—A Sub-Committee has been asked to report fully on the state of the tramways undertaking, in preparation for the Corporation taking it over; the question of procedure when the lease expires will also be considered. Mr. Newington, city electrical engineer, is to report on the advisability of electrically lighting the cars.

Glasgow.—A sum of £490, including a grant of £50 given by the T.C.'s Departmental Committee, has been collected in boxes in the cars on the Glasgow system, for supplying seasonal comforts for the ex-members of the department who joined the 17th Batt. of the H.L.L., which is mainly composed of Corporation ex-workers. A number of parcels have already been sent to France, and, under a novel scheme which has been introduced, a considerable portion of the fund has been invested in wool, with which the wives of the men, the women employees of the department, and others, are engaged in knitting comforts for the men in the trenches.

L. & S.W. Railway Electrification.—According to the *Daily Express*, Mr. H. H. James, superintendent of the L. & S.W. Railway, states that the new service of electric trains between Kingston and Waterloo will be brought into operation on Sunday, January 30th.

Middlesbrough.—RAILLESS TRACTION.—The non-delivery of the cars is responsible for the delay in the opening of the railless traction system which will connect up Middlesbrough with the Eston district lower down the Tees bank. Owing to Government contracts, the delivery of the cars is not expected for two or three months.

Stretford.—Complaint has recently been made of the inadequacy of the car service to Trafford Park from Manchester and Salford. The question was raised at a meeting of the Stretford D.C. last week, and the clerk was instructed to draw the attention of the Manchester and Salford Corporations to the matter, and to express the hope that an improved car service might be arranged.

U.S.A.—The first actual tests of the Chicago, Milwaukee and St. Paul R.R. Co.'s new electrified mountain divisions have just been made by officials and directors of the system, who toured the completed sections of the 400-mile electrified district in three special cars drawn by one of the new 260-ton, 3,000-volt electric locomotives. After making passenger-train tests, running at all speeds up to 70 miles an hour, the officials witnessed tonnage tests, in which locomotives used on passenger trains, equipped for heavy hauling instead of speed, pulled 2,500 tons at a uniform speed of 16 miles an hour. It is expected that the all-steel trans-continental trains of this company will be operated electrically over the continental divide at an early date. While the cost of the work has been \$20,000,000, the saving in fuel, in increased hauling capacity, in maintenance of speed schedules and in mechanical upkeep will be so large that a return of 20 per cent. a year on the investment is anticipated. The regenerative braking device in the equipment of the electric locomotives proved under the tests to be completely successful.—*Electrical World*.

TELEGRAPH and TELEPHONE NOTES.

Cables in Code.—The Postmaster-General announces that the Rubber edition of Broomhall's "Imperial Combination Code" has been added to the list of codes authorised for use in foreign telegrams, except in telegrams to Argentina, Brazil, Paraguay, Uruguay and Honduras.

Marconi v. Telefunken.—The Standard Oil Co. of New Jersey, has decided to remove the Telefunken wireless apparatus from 22 of its ships, and to substitute the Marconi system, with American operators. A contract has been made with the Marconi Wireless Telegraph Co. of America to this end, and is regarded by the Marconi Co. as a very important transaction.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—February 18th. Melbourne, Brunswick and Coburg Tramways Trust. Six radial trunks.*

April 15th. P.M.G. Common-battery multiple switchboard, or automatic or semi-automatic switchboard, and associated apparatus. See "Official Notices" December 31st, 1915.

BRISBANE.—February 28th. Deputy P.M.G. Gas engine, generator, battery, power board, &c., for the Post Office, Townsville, Queensland. (Schedule No. 370.) High Commissioner's Office, 72, Victoria Street, S.W.

MELBOURNE.—February 16th: 51 electric staff instruments. February 23rd: Two commutator slotting machines, for the Victorian Railway Commissioner.*

February 2nd. Agent-General for Victoria. Fuse distribution boxes and fuses, for the Victorian State Railways. See "Official Notices" January 14th.

SYDNEY.—February 7th. Metropolitan Board of Water Supply and Sewerage. For No. 1 pumping station at Ultimo. Two centrifugal pumps and electric motors (4,000 gallons per minute each), switchboards, starters, &c. Contract No. 1,301.*

February 28th. Municipal Council. Tenders for induction regulators. Specifications (11s. 6d.) from the Electric Light Department, Town Hall, Sydney.

May 3rd. N.S.W. Railways and Tramways Department. One 2,500-kw. turbo-alternator, for Zebra Street, Newcastle, power house. Specifications (20s.) from the Engineer's office, 61, Hunter Street, Sydney.

Croydon.—January 24th. Corporation. Stores for the Tramways Department. Particulars from the Manager, Tramways Department, Thornton Heath.

Doncaster.—January 24th. Relaying portion of the permanent-way, Nether Hall Road, for the Corporation Tramway Department. Mr. E. E. Ford, Acting Borough Engineer (returnable deposit of £1 1s.).

Dublin.—January 21st. Corporation. Arc lamp carbons. See "Official Notices" January 14th.

Eccles.—X-ray apparatus at the Eccles and District Hospital, for the Board of Management.

Halifax.—February 14th. Corporation. Twelve months' supply of electric lighting fittings and accessories, cables, telephone wire, meters, &c. See "Official Notices" to-day.

London.—ISLINGTON.—January 21st. B.C. Twelve months' supply of engine-room stores, electrical fittings, meters, cables, &c. See "Official Notices" Dec. 31st.

BERMONDSEY.—February 10th. B. of G. Twelve months' supply of electric lamps. Forms of tender from Mr. E. Pitts Fenton, Clerk to the Guardians, 283, Tooley Street, S.E.

FULHAM.—The Electricity and Lighting Committee recommends that no annual contracts be entered into for the supply of electrical and engineering stores, but that the borough electrical engineer be authorised to purchase in the open market when required.

HAMMERSMITH.—The Electricity Committee recommends the B.C. to invite tenders for 12 months' supplies of electric light sundries, insulated wires, packing and jointing materials, joint-boxes and connections.

New Zealand.—AUCKLAND.—February 23rd. City Council. Centrifugal pumping electric motors, and automatic starting and controlling apparatus, for the four city pumping stations. Specifications from the office of the Water Board, Town Hall, Auckland.

DUNEDIN.—May 17th. City Council. (1) Tramcar bodies; (2) electrical equipment. Plans, &c., from the Town Clerk, Dunedin.

RAETIHL.—March 14th. Town Board. 40-H.P. hydro-electric generating set, switchboard, &c. Plans and particulars from Messrs. H. W. Climie & Son, Raetihl.*

WELLINGTON.—March 8th. Public Works Office. One 3,000 kw. generator and one 4,300-H.P. water turbine, at Lyttelton, for the Lake Coleridge electric power scheme. Specifications, &c., may be consulted by British firms at the office of the High Commissioner in London for New Zealand, at 13, Victoria Street, S.W.

Pembroke (Dublin).—February 7th. U.D.C. Twelve months' supply of electrical goods. Specifications from the Town Hall, Ball's Bridge, Co. Dublin.

Spain.—Tenders have just been invited by the municipal authorities of Narros del Castillo (Province of Avila) for the concession for the electric lighting of the town.

Swansea.—February 7th. Electric light installation, Brynmill School, for the Borough Education Committee. Mr. A. W. Holden, Clerk, 9, Grove Place (returnable deposit of £1 1s.).

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Auckland.—The U.D.C. has accepted the tender of Messrs. D. Latham & Co. for the E.L. installation at the new engine house at the waterworks, at £36.

Barnsley.—The Electricity and Lighting Committee has accepted the following tenders:—

Williams & Robinson.—Turbine, £2,580; condenser, £2,150.
Dick, Kerr & Co.—Alternator, £1,389.
B.I. & Helsby Cables, Ltd.—H.P. and L.T. feeder, £2,241.

Bath.—The D.C. has placed a contract with Messrs. Chamberlain & Hookham, Ltd., for meters for the ensuing year.

Cape Town.—The tender of the South African General Electric Co. has been accepted by the Corporation for a British Thomson-Houston turbo-alternator, for £12,160; also the tender of Messrs. Symes & Co., at £3,050, for a rotary converter.

Dewsbury.—The Electricity and Tramways Committee of the T.C. has accepted the tender of Messrs. Heenan & Froude for an air filter, at £187.

Glasgow.—The T.C. Tramways Committee has accepted the following offers for scrap:—Copper, and armature coils, Messrs. P. & W. MacLellan; brass, and rubber-insulated cable, Messrs. R. M. Easdale & Co.; dry cells, Messrs. J. Jackson & Co.

Government Contracts.—List of new contracts for December, 1915:—

WAR OFFICE.

Electric cable and wire.—B.J. & Helsby Cables, Ltd.; Hooper's Telegraph and T.L. Works, Ltd.; Johnson & Phillips, Ltd.; Liverpool Electric Cable Co., Ltd.; Midland Electric Wire Co., Ltd.; Siemens Bros. and Co., Ltd.; Western Electric Co., Ltd.
Electric cables.—Siemens Bros. & Co., Ltd.
Electric lightings sets.—Fyfe, Wilson & Co.; Parsons Motor Co., Ltd.
Distribution boards, switches and fuses.—Kartret Engineering Co.
Engines and generators.—Austin Motor Co. (1914), Ltd.; Keighley Gas and Oil Engines, Ltd.
Switchgear for transformers.—British Thomson-Houston Co., Ltd.
Generating sets and parts.—Austin Motor Co. (1914), Ltd.
Works services.—Electric lighting at R.P.C. Camp, Theford; Mann, Egerton & Co. Electric lighting new hut hospital, Dublin; Ellis and Ward, Ltd. Electric lighting installation at Houghton Regis Camp; Grindstone & Co. Electric lighting at hatted camps, Duddington and Darghorn, Eastfield and Vostfield.—Grindlay, Ross & Co., Ltd.
Power houses at Crombie and Rosyth.—W. Finlayson & Sons.

POST OFFICE.

Additional automatic equipment at Leeds Automatic Exchange.—Automatic Telephone Manufacturing Co., Ltd.
Insulators.—J. Bourne & Son; Taylor, Tannicliiff & Co.
Condenser paper.—Britalins, Ltd.
Battery zinc.—Eyre Smelting Co., Ltd.
Galvanised-iron wire.—R. Johnson & Nephew, Ltd.

H.M. OFFICE OF WORKS.

Engineering services.—Admiralty electric wiring: W. O. Rooper & Co.

London.—The London General Omnibus Co. has, we hear, just placed a large repeat order for electric lighting sets with Messrs. C. A. Vandervell & Co., Ltd.

Messrs. Pope's Electric Lamp Co., Ltd., have secured a renewal of their contract for carbon and metal-filament lamp requirements for 1916 from the Nelson Line of steamers. Owing to the large demand for Pope electric lamp shades, a further stock is being printed, and applications for them should be sent immediately.

HAMMERSMITH.—In order to augment the stock of coal at the electricity generating station, the Electricity Committee recommends the acceptance of the offer of Messrs. Cory Bros., Ltd., for a supply of 90 tons per week, to June 30th next, of 1-in. Hucksall High Hazel coal, alongside Chancellor's Wharf, at 21s. 6d. per ton.

BERMONDSEY.—The following tenders have been received by the Borough Council for the supply of motors for the cruiser plant:—

Supply and erection complete:	Motor reva.	Price.	spare armatures.
J. Evans & Co., Ltd.	950	£689	£112
General Electric Co., Ltd.	920	551	491
Cost of fitting spare armatures not included:			
Crompton & Co., Ltd.	1,000	641	491
No erection, and spare armatures not fitted:			
Brit. Westinghouse Co., Ltd.	1,000	580	525
Brit. Thomson-Houston Co., Ltd.	1,020	551	503
Siemens Bros. & Co., Ltd.	1,000	645	491
Alternative tenders:			
J. Evans & Co., Ltd.	950	756	700+
General Electric Co., Ltd.	1,100	815	727
Plus 15s. per yard run of cable.			
† Enclosed pipe-ventilated motors.			

The Council is recommended to accept the tender of the General Electric Co., Ltd., at £551, plus 15s. per yard run of cable, estimated at £33. In its report on the subject the Finance Committee stated that it was informed that when the General Purposes Committee decided to recommend the Council to accept the tender of the General Electric Co. it did so upon its being reported to it that it would be the lowest tender, as it was thought that Messrs. Crompton & Co.'s tender did not include the cost of changing the spare armatures. It has since been ascertained that Messrs. Crompton's estimate did include such cost, as provided for in the specification. The Committee therefore, to save time, recommended the acceptance of Messrs. Crompton's tender.

The Electricity Committee has accepted the tender of the B.I. and Helsby Cables, Ltd., for three 5 units, complete with bus-bar, for mounting in Callender pillar, and one 3 unit, for £29.

Stretford.—The U.D.C. has accepted the tender of Messrs. W. T. Glover & Co., Ltd., at £356, for the supply of 400 yards of paper-insulated, lead-covered cable; also the tender of Messrs. Veritys, Ltd., at £53, for a 10-H.P. motor.

Swindon.—The T.C. has accepted the tender of the Acetylene Illuminating Co., Ltd., for an acetylene gas plant for use in connection with the repair of the tramway track, at £11.

Taunton.—Messrs. Chamberlain & Hookham, Ltd., have received a contract from the Council for meters for the year.

Windsor.—The T.C. has accepted the tender of the Pulsometer Pump Co., Ltd., for an electrical pump, at about £200.

FORTHCOMING EVENTS.

Royal Institution of Great Britain.—Friday, January 21st. At 5.30 p.m. At Albemarle Street. Lecture on "Problems in Capillarity," by Prof. Sir J. Dewar, F.R.S.

Thursday, January 27th. At 3 p.m. At Albemarle Street, W. Paper on "Fuel Economy from a National Standpoint," by Prof. W. A. Bone, F.R.S.

Greenock Electrical Society.—Friday, January 21st. At 7.45 p.m. At the Temperance Institute, 15, West Stewart Street. Paper on "Direct current Machines," by Mr. J. A. Kinnaird.

Institute of Mechanical Engineers.—Friday, January 21st. At 8 p.m. At Great George Street, S.W. General meeting.

Association of Mining Electrical Engineers (West of Scotland Branch).—Saturday, January 22nd. At 4.30 p.m. At the Royal Technical College, Glasgow. Paper on "Electrical Shaft Winding," by Prof. D. Burns.

Notts and Derbyshire Branch.—Saturday, January 29th. At University College, Nottingham. Paper on "Unusual Breakdowns in Colliery Electrical Plant," by Mr. B. Devine.

Manchester Association of Engineers.—Saturday, January 22nd. At the Grand Hotel, Aytoun Street. Paper on "Cast Iron: The Strength and Properties of Castings," by Mr. E. L. Rhead.

Salford Technical and Engineering Association.—Saturday, January 22nd. At 7 p.m. At the Royal Technical Institute. Presidential Address. Musical social evening.

Post Office Telephone and Telegraph Society of London.—Monday, January 24th. At 6.30 p.m. At the I.E.E., Victoria Embankment, W.C. Paper on "Public Administration and Finance," by Mr. F. C. Cook.

Institution of Civil Engineers.—Tuesday, January 25th. At 5.30 p.m. At Great George Street, S.W. Discussion on Mr. F. W. Carter's paper on "The Electric Locomotive."

Institution of Electrical Engineers (Manchester Local Section).—Tuesday, January 25th. At 7.30 p.m. At the Engineers' Club, 17, Albert Square. Paper on "The Principles of Modern Printing Telegraphy," by Mr. H. H. Harrison.

Liverpool Engineering Society.—Wednesday, January 26th. At the Royal Institution, Colquhoun Street. Paper on "Recent Developments in Telephony," by Mr. G. C. Maris.

University College, London.—Wednesday, January 26th. At 5.30 p.m. At University College, Gower Street, W.C. First lecture on "The Electrical Production of Nitrates for Fertilisers and Explosives," by Mr. E. Kilburn Scott.

Leeds Association of Engineers.—Thursday, January 27th. At 7.30 p.m. At 6, Park Lane. Paper on "Electric Heating: Its Present Position and Future Development," by Mr. G. Wilkinson.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, January 28th. At 7.30 p.m. At Bolbec Hall, Newcastle-on-Tyne. Ordinary general meeting.

NOTES.

The B.T.H. Co., Ltd.—With reference to an article that appeared in the *Sunday Chronicle* on "Germans and the Electrical Industry," a couple of months ago, in which the writer, one "John Briton," made certain references to the British Thomson-Houston Co., Ltd., a further article appeared in the same paper on Sunday last, in which the writer says:—

"When I wrote last on the German influence in the electrical industry, some two months ago, I gave an account of the extraordinary ramifications of the great German Trust, called briefly the A.E.G., of Berlin, and in this connection, before I go further, I desire to clear up an unfortunate misunderstanding. Among the 'Allied and subordinate' companies, of which I gave a list, I mentioned the British Thomson-Houston Co., of Rugby. I did not say that this company was owned or controlled by the A.E.G., but this inference has been drawn from my article, and I therefore desire to say that it is unfounded.

"The truth is that the B.T.H., of Rugby, is mainly controlled by the General Electric Co., of Schenectady, which in its turn is a descendant of the Thomson-Houston Co., of America. The Thomson-Houston Co. in its day sold its European patents to a number of companies on this side of the Atlantic, some of which in due course were absorbed by the A.E.G. and some by the G.E. Co.

"The British Thomson-Houston Co. belongs, as I have said, to the latter category. It is true that the A.E.G. purchased the German rights under the patents of the G.E. Co. and the B.T.H. Co. in exchange for the American and British rights under its patents, but I am glad to be able to state that the German company has no control over, or interest in, either the American or British company, and I regret if any other meaning has been read into my article, and if any harm has been done to the B.T.H. Co. thereby. I am also able to state that the A.E.G. has no control over the electric lamp business in this country, but on the contrary, by reason of British patents it was obliged to purchase from British companies all such lamps as it sold here."

Trading with the Enemy.—The New Bill.—As we go to press the text of this Amendment Bill is being published. Among other things it gives the Government power to wind up enemy businesses under certain circumstances. We shall refer to the matter next week.

Inquiries.—Makers of appliances for the manufacture of storage batteries are asked for.

Appointments Vacant.—Electricians and motor mechanics are wanted for military camp power-houses (South of Ireland district), at 40s. to 45s. +.

The Development of Italian Hydro-Electric Works.

—The conference to which we briefly referred in our last issue took place in Milan, in the offices of the Società Imprese Elettriche, in the presence of Senator Facheris and a number of members of the Lower Chamber, and from a report of the proceedings now to hand, it would appear that the responsibility for assisting Italy to develop the water powers of the country for industrial purposes in general rests with the Government. Signor Ettore Conti, the engineer who had been invited to give an address on the subject, first referred to the great importance attached at the present time to the question of the electrical industry in relation to national independence and the economic defence of the nation. In view of the European conflict, he stated that the Italian industry must fight on the side of the army, and in order to attain the object which had been predetermined in the Italian war it was also necessary to strive in the economic field, so as to secure that industrial independence which had been endangered by the hegemonical dream of the Central Empires, in the sense of endeavouring to translate it into reality first by trying to surpass from an economic point of view, and then by supporting this by force of arms. The independence of Italy would be achieved, in his opinion, by the adoption of a right policy with regard to Customs and transport services, the diffusion of professional education, the regulation of credit, and above all by the pursuit of an enlightened national policy in respect of the utilisation of water powers. Dealing then with the problem from various standpoints, the lecturer first discussed the subject of the conversion of the railways to electric traction. It would be impracticable to transform the whole of the railway mileage so as to work it by means of power obtained from hydroelectric works, as such a scheme alone would require 1,000,000 H.P. But it would be possible to increase the present electrically-operated mileage of 210 to 1,200 miles within a period of 10 years, and at an expenditure of £4,000,000. It would also be practicable for a considerable portion of the power required by the industries of the country to be obtained from electricity instead of coal, and electricity could also be employed as motive power in agricultural operations and for the extraction of nitrogen from the atmosphere for fertilising purposes.

The question of the sale price of electricity next engaged attention. On this point Signor Conti stated that the price per K.W.-hour was 9d. 30 years ago. It was now sold to large industrial consumers at from ½d. to 1½d., and at ½d. per K.W.-hour in special cases. He was firmly convinced that it would be possible to establish hydroelectric works which would be able to dispose of energy at from ½d. to 1½d. per K.W.-hour, and when that object was achieved the iron and steel and chemical industries in Italy would no longer be exceptional industries. After having reviewed the existing legislation with regard to the electrical industry, the speaker submitted that nothing had been done in this way to encourage the national industry. If the electrical industry was to be developed on a grand scale, so as to render possible the erection of large stations and consequently the supply of energy at cheap rates, the Government would have to avoid delays and solve the problem fully, bearing in mind the legitimate and modest wishes of industrialists, whilst at the same time the State revenue would rapidly increase to the advantage of the country. The lecturer met with a very cordial reception and the discussion which ensued largely turned upon the means to be adopted in approaching the Government with a view to the adoption of immediate measures so as to permit existing hydroelectric works to be enlarged without delay by the construction, in the first place, of new reservoirs with the object of coping with the scarcity of coal.

The members of the Lower Chamber present expressed themselves convinced of the urgency of the problem, and a Committee was appointed to draw up a petition to be presented personally to the Government. In the meantime the address is to be printed in pamphlet form, and copies will be sent to all the deputies in order to secure their support in favour of this movement. A considerable time will be required before any practical advantage can be derived from the granting of facilities by the Government in the near future. That the Government will assist the electrical industry, as well as other industries, to secure independence from the Teutonic yoke seems very probable.

Fatalities.—**METHIL.**—At Kirkcaldy, Fifa, on Friday, Sheriff Armour Hannay and a jury conducted an inquiry into the circumstances of the death of Alex. Martin, apprentice electrician, residing at Methil, who died on December 11th, 1915, in the No. 2 Pit, Leven Collieries, owned by the Fife Coal Co., from an electric shock.

George Meredith, foreman electrician, said the boy Martin, who was 15½ years of age, had been with him for about a year. On the day in question he had instructed the lad to replace a lamp on the west side of the pit bottom. All apprentices were warned not to touch high-tension panels. Witness stated that he did not think it possible to apply to that particular panel the locking apparatus suggested by the Inspector of Mines. The door of the panel had been levered open by the deceased, who was a lad keen on his work, and was undoubtedly curious. Joseph Lamb, the motor-man, said deceased came to his room and said: "Here are two lamps for you." Witness then heard Martin open the door of the panel, and shouted: "Watch what you're doing now." Deceased replied: "It's all right, I have the gloves on." Witness then said: "See and mind." Witness received no answer, and on looking over to see what deceased was doing he saw Martin standing with his back against the panel and his mouth open. Witness took off the switch, and the lad fell back in his arms and never recovered.

There was a mark on his forehead like a burn. George Gordon Fraser, chief electrical engineer to the company, said the panel was quite safe. There were sufficient notices of danger. The lad knew and had been warned of the danger. No matter what locking device was used, there would be danger in the human element. The Sheriff suggested that the jury add a rider to their formal verdict recommending that more stringent precautions and regulations be adopted in regard to apprentice electricians, and that the mines inspector should be invited to consider, along with the management, what electric device for protecting such panels could be adopted. Mr. Macgregor, the coal company's representative, addressing the jury, pointed out that no matter what device was adopted, so long as boys were boys and did not obey their superiors, accidents were bound to arise. A formal verdict was returned, the jury adding a rider as recommended by his Lordship.

A motor-car collided with an electric standard on the Victoria Embankment, London, on 17th inst. The standard was broken off 12 ft. from the ground, and one man was killed.

Volunteer Notes.—**ENGINEERING INSTITUTIONS' VOLUNTEER ENGINEER CORPS.**—Orders for week commencing January 24th, 1916.—By Lieut.-Col. C. B. Clay, V.D., Commandant.

Drills, 6.25 to 7.25; 7.25 to 8.25 p.m.

Monday, January 24th.—Sections 1 and 2, Technical; Sections 3 and 4, Lashings and Trestle Bridging, Signalling Class and Recruits.

Tuesday, January 25th.—School of Arms, 6 to 7 p.m.

Thursday, January 27th.—Shooting for Sections 1 and 2, and Signalling Class.

Friday, January 28th.—Sections 3 and 4, Technical; Sections 1 and 2, Lashings and Trestle Bridging; Signalling Class and Recruits.

Saturday, January 29th.—Uniform Parade, 2.45 p.m.

Sections for Technical Parade at Headquarters, London Electrical Engineers, 46, Regency Street, S.W.

Sections for Shooting Parade at Miniature Ranges.

Unless otherwise ordered, all Parades at Chester House.

E. G. FLEMING,

Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON REGIMENT (VOLUNTEERS).—Battalion Orders by Colonel S. G. Grant (Officer Commanding), Thursday, January 20th, 1916:—

Week-end Parades.—The Inter-Platoon Competition will be fired at the Acton Range on Saturday next, the 22nd and 23rd inst. This will take the place of the usual week-end parades.

"Derby" Recruits will parade at Wembley Park, on Saturday and Sunday next, at the usual times.

Musketry.—The Acton Range will be open on Saturday morning, the 22nd inst., for Inter-Platoon Competition practice. Members to parade at 11 a.m. Names to be sent to Musketry Staff not later than Friday mid-day.

The Competition will commence on Saturday afternoon, the 22nd inst., at 1 p.m. The competing Teams are Platoons Nos. 2 and 3, Blackheath and North London.

The Competition will be continued on Sunday, the 23rd inst. The Teams—Platoons Nos. 5, 10, 13 and 14—are to Parade at 11 a.m. Teams—Platoons Nos. 4, 7, 12 and 15—to Parade at 2 p.m.

Men to Parade punctually, in uniform, with bayonets.

Non-competitors may attend to witness Competition.

A. G. JOINER, Major and Adjutant, O.B.C.

Institution and Lecture Notes.—**The Institution of Electrical Engineers.**—We are informed by the secretary of the Institution, Mr. P. F. Rowell, that the Council has passed the following resolution:—

"The Council are of opinion that Clause 41 of the Articles of Association provides sufficient means for the expulsion of undesirable persons (whether alien enemies or not) from the Institution, consistently with making the thorough investigation of the circumstances of each case which is essential in order to avoid the risk of doing grave injustice to individuals."

The Council has also under consideration the question whether the Institution should obtain further powers for the expulsion of alien enemies.

[We pointed out on December 31st that Article 41 contained adequate powers for the expulsion of alien enemy members, and in our last issue we surmised that the Council would not take action in the matter, having already returned an evasive reply to inquiries on the subject. "Whether anything will be done depends entirely upon the members of the Institution, as Article 41 can only be brought into operation by the action of individuals, and the Council, it will be observed, is not committed to any policy whatever."—EDS. ELEC. REV.]

Metropolitan Association of Electric Tramways Managers.—A meeting of the members of this Association was held on 14th inst., at the Municipal and County Club, Whitehall, when the following were present:—Messrs. Ullmann (East Ham), chairman, Schofield (Leyton), vice-chairman, Moffet (West Ham), Harvey (Ilford), Mackinnon (London United), and Goodyer (Croydon), hon. secretary. Letters were received from Messrs. Fell (L.C.C.), Bruce (L.C.C.), Murray (Walthamstow), Stokes (Bexley), Hammond (Metropolitan Electric), Williams (Brith), and Mason (South Metropolitan), who were unable to attend. Various matters of interest were discussed.

Chinese Power House Bombed.—A Central News dispatch from Hong-Kong, states that on January 14th while the chief engineer of the Kwang-Tung Electric Supply Co. was entertaining some friends, including the British Consul, at a bridge party, an unknown miscreant threw a bomb into the company's power house. All the windows were smashed, and two or three coolies were killed.

Lead Poisoning in Accumulator Works.—During the month of December, 1915, twelve cases of lead poisoning in electrical accumulator works were reported to the Home Office under the Factory and Workshop Act, the total cases for the year being 64 as against 41 for 1914.

The Prussian Government and Electricity Works.—The Spanish newspapers have recently recorded complaints made in some political circles alleging that certain new laws have become dead letters—dead in the sense that they have never been promulgated since they were passed, and have, as it would seem, almost become forgotten. But a still stranger case has just been brought to light in Germany, where a joint decree, made on May 26th, 1914, was published for the first time in the middle of January of the current year. The decree, which is signed by the Prussian Minister for Trade and Industry, the Minister for Public Works, and the Minister for Internal Affairs, relates to the supply of electricity, but it is not connected with the scheme reported to be in prospect for the nationalisation of the supply industry. The object of the decree is to secure a greater measure of production for the public interests in regard to overland central stations, the establishment of which has not required the sanction of Parliament—but which has been merely subject to private agreements and the consent of officials representing the Government authorities. In future, however, certain restrictions are to be imposed, and the promoters of overland stations are only to obtain the right of expropriation, the use of Government ground property (waterways of first importance, domains, forests and railways), after the Government officials for the districts concerned have settled the requirements to be stipulated in the general public interest.

The decree points out, in the first place, that the requirements cannot be prescribed from a general standpoint, as the requisite experience is lacking, particularly as the conditions coming into consideration are so varied that it is impossible to deal with all cases in a uniform manner. Hitherto the right of expropriation has been made dependent upon the non-existence of a monopoly in the delivery of materials and plant for installations. In appropriate instances the undertakers have been placed under the obligation to furnish energy to everyone in their area of supply in so far as this could be effected without endangering the economy of the undertaking, and this condition will also be adhered to in the future. Efforts must be directed, the Government officials are instructed to secure that the supply of districts yet unprovided with electricity shall not be undertaken arbitrarily by one or another undertaker, but that it shall be proceeded with in the most economical manner. The appropriate supply of a district may be prejudiced for a long time by the erection of small works of limited capacity, whilst at the same time large and efficient works, if they supply only the more profitable parts of a great area, would also prejudice the equal treatment of favourable and unfavourable districts that is requisite for the systematic supply of the whole of the area. This can also take place in the case of municipal works extending their supply to parts of the outlying districts, for which a different supply under circumstances would be more suitable for the whole.

It is now proposed, as occasion may arise, to bring the influence of the State to bear in this direction in the case of existing works by only permitting them to make use of State lands according as the opportunity offers, when they give legal undertaking to the Government officials for the district not to exceed, without the consent of the latter, the line of demarcation representing the whole of their present area of supply. In the case of those works which possess the right of expropriation for a specified area without this undertaking being imposed, this measure will also apply in order to prevent them from supplying beyond their particular areas without the sanction of the Government officials. The proposed establishment of new works will be subject to inquiry as to whether their erection should be opposed or as to how the line of demarcation for them shall be drawn. Both in the case of existing works and of new stations the conditions can be imposed that neighbouring districts shall also be supplied even if they promise to yield a lower return. A further important object is to prevent the existing tendency for the development of private supply monopolies from further growing, which has also to be taken into consideration in fixing the line of demarcation, whilst efforts must be made to obtain a right of determining whether works which have been established by local authorities or with the substantial participation of such authorities, shall in future come under the control of private undertakings. The decree, which is apparently addressed to the Government officials in each district, further suggests the possibility of influencing the fixing of charges for supply in so far that the charges must be re-examined at certain intervals, and a reduction demanded as occasion may arise. These instructions are neither regarded as exhaustive nor are they to be considered without distinction in every case, the duty of the State, the decree concludes, being to keep the development on sound lines, but not to hamper it.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—Mr. J. DUGDALE, the Oldham Corporation tramways manager, has strained the ligaments of one of his legs while on a visit to Rotherham, and is laid up there.

Mr. D. LLOYD has resigned his position as engineer to the Abertillery U.D.C., he having received an appointment under Messrs. Partridge, Jones & Co.

Messrs. YOUNG and YILDHAM, of the Swansea Corporation electricity staff, have joined the Forces.

The Barnes U.D.C. has granted Mr. G. C. LAW, assistant electrical engineer at the electricity works, a gratuity of £50 for additional services rendered since the outbreak of the war to December 31st last.

Mr. WALTER F. LONG, the city electrical engineer at Cape Town (a position which he has occupied for nearly 14 years), has resigned in order to take up an appointment as general manager of the Cape Town Tramways Co. Mr. S. J. CLUNAS, who has been station engineer for some years, and has acted as deputy for Mr. Long during his absence, has been appointed acting city electrical engineer.

General.—Mr. R. G. BLAKE, a young electrical engineer, employed by Messrs. Deveraux & Moody, Newcastle, has been presented, on behalf of the Carnegie Hero Trust Fund, with a silver watch, and on behalf of the Royal Humane Society with a certificate on vellum, for having rescued a boy who was drowning in the Tyne.

Mr. D. H. MORRIS, Glasgow manager of Messrs. Lowdon Bros. & Co., has been given a commission in the R.N.V.R.

Mr. J. T. TAYLOR, late representative for Messrs. Pirelli, Ltd., has now joined the staff of the British Thomson-Houston Co., Ltd.

Second-Lieutenant A. R. COURTENAY (late acting-manager of the publication department, General Electric Co., Ltd.) has sailed for the Mediterranean. After about two months' active service in France with the R.N.A.S., Armoured Car Aeroplane Support (R.N.V.R.), he transferred to the Army Service Corps, and he is now a Second-Lieutenant in this Corps.

The Herbert Frost Co., Ltd., of Chapel-en-le-Frith, ask us to state that Mr. W. E. DIXON is not now in their service.

Mr. HAROLD BOUTCHER, who has been acting as electrical engineer on one of H.M. Hospital Ships, has just returned from the Dardanelles, and been appointed electrical engineer to the Norman Flight Co., Bognor.

The *London Gazette* contains the following notice: Territorial Force. London Electrical Engineers. The undermentioned to be Second-Lieutenants:—Sapper G. S. H. COX; Private A. D. Hedgecock, from the H.A.C.; and Lance-Corporal G. A. Wadham, from Royal Fusiliers.

Mr. A. P. KELSEY, one of Messrs. Falk, Stadelmann & Co.'s country representatives, has joined the Royal Flying Corps.

Roll of Honour.—Private ARTHUR BOOTH, of the Ashton Territorials, who has been wounded in action, was an electrician employed by Messrs. Armstrong, Whitworth and Co., Manchester.

Private WM. ROYLE JENKINSON, of the 15th Cheshire Regiment (Wirral "Pals"), who has fallen in action in France, was, until his enlistment after the outbreak of war, engaged as an electrical engineer with Messrs. Lever Bros., Ltd., Port Sunlight.

Private ALBERT W. CARROLL, of the Rifle Brigade, who was, prior to his enlistment, on the staff of the British Thomson-Houston Co., Ltd., at Rugby, has been killed in action in France. He returned to the Front two days before Christmas after recovery from fever.

The death is reported, in action in France, of Private FRANK JONES, of the 1st Bucks. (East Kent Regiment)—formerly on the staff of the Isle of Thorns Tramways Co.

Mr. KENNETH GIBBEL, of Messrs. Wm. Gaisel & Co., who has been serving in the Royal Engineers at the front in France, has been wounded, and is in hospital in this country.

Obituary.—Mr. GEORGE TUCKER.—We regret to record the death, which occurred on Saturday last, at his residence in Lordship Road, Stoke Newington, of Mr. George N. G. Tucker, of the *Electrician* Printing & Publishing Co., Ltd. Mr. Tucker, who was in his 61th year, was associated with the *Electrician* in one capacity or another from 1878, the year in which the present paper first made its appearance, down to the time of his death. He became principal proprietor of the paper about ten years ago. Between the years 1878 and 1888 his interests naturally centred chiefly around submarine and land telegraphy. Mr. Tucker was responsible for the publication of "The Electrician" series of technical books, in which the researches and studies of many brilliant writers are contained, among such authorities being Heaviside, Ewing, Gore, Carter, Lodge, and Mrs. Ayrton. Mr. Tucker also founded the *Electrician* Electrical Trades Directory and Handbook (the Blue Book), and he took a personal interest in its production. He seldom missed the Electro-Harmonic concerts, even in recent years, and only failing health prevented his attendance up to the last.

CAPTAIN COLTHURST VESSEY.—The directors of the Dublin and Lucan Electric Railway have placed on record their deep regret at the death of Captain Colthurst Vessey, D.L., vice-chairman, who had been associated with the concern for 18 years. Captain Vessey was also a director of the Dublin United (Electric) Tramways Co.

MR. W. C. BLENKARNE.—We regret to record the death of Mr. W. C. Blenkarne, senior London traveller for Messrs. Falk, Stadelmann & Co., Ltd., who was well known in the lighting trade throughout London, more particularly in the Southern districts, where of late years he had represented the above firm. The deceased gentleman was for a long time interested in a London glass works, but he abandoned this on joining the staff of Falk, Stadelmann & Co., Ltd., in 1891, whom he represented until his death on the 12th inst. He had seen longer service with the firm than any other London traveller.

MR. R. C. FREWER.—The death has taken place, after an operation, of Mr. Robert Chas. Frewer, who had been on the staff of Siemens Bros. Dynamo Works Co., of Stafford, for 25 years. He was 48 years of age.

WILLS.—The late Professor VIVIAN B. LEWES left £13,353.

SIR A. W. RUCKER's estate amounted to £40,465.

NEW COMPANIES REGISTERED.

South Wales and West of England Wireless Training College, Ltd. (142,641).—This company was registered on January 6th, with a capital of £5,000 in £1 shares, to carry on a college or school for training and instruction in wireless telegraphy and telephony, and electrical and other engineering, and to adopt agreements (1) with the South Wales Wireless Training College, Ltd., and (2) with J. R. Schofield. The subscribers (with one share each) are: W. N. Jones, Dyffryn, Ammanford, colliery proprietor; D. Radcliffe, Pen-y-lan, Cardiff, shipowner. Private company. The number of directors is not to be less than two or more than seven; the subscribers are to appoint the first. Qualification, £250. Registered office: Market Buildings, St. Mary Street, Cardiff.

Parsons and Hodges, Ltd. (142,731).—This company was registered on January 15th, with a capital of £3,000 in £1 shares, to take over (1) the business of an electrical, mechanical and general engineer and contractor carried on by A. J. Hodges, at Regent Street, Leamington, in succession to W. Parsons & Co., Ltd.; and (2) the similar business carried on by A. E. Mason, at 63, Parade, Leamington, as Receiver for the debenture-holders of Brown & Parsons (1913), Ltd. The subscribers (with one share each) are: W. Parsons, 63, Parade, Leamington Spa, electrical engineer; A. J. Hodges, 26, Strathern Road, Leamington Spa, electrical engineer. Private company. The number of directors is not to be less than two or more than five; the subscribers are to appoint the first. Solicitor: G. Williams, Bank Buildings, Cradley Heath. Registered office: 63, The Parade, Leamington, Warwick.

Atkinson, Lloyd and Co., Ltd. (142,724).—This company was registered on January 15th, with a capital of £500 in £1 shares, to carry on the business of electrical engineers, manufacturers, agents, and contractors. The subscribers (with one share each) are: J. E. Atkinson, 120, Moss Lane, Swinton, Manchester, electrical engineer; S. Lloyd, 28, Duchy Street, Salford, Manchester, electrical engineer; R. F. Peacock, 26, Searisbrick Road, Levenshulme, Manchester, electrical engineer. Private company. The number of directors is not to be more than three; the first are J. E. Atkinson, S. Lloyd, and R. F. Peacock. Solicitor: W. I. Hawken, 71, Market Street, Manchester.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Burt, Escare and Denelle, Ltd.—Particulars of £7,500 debentures, created December 22nd, 1915, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's property, present and future, including uncalled capital (if any). No trustees.

A memorandum of satisfaction in full on December 30th, 1915, of debenture stock dated April 14th, 1911, securing £3,900, has been filed.

Coatbridge and Airdrie Electric Supply Co., Ltd.—Further charge on the Coatbridge and Airdrie undertakings and the company's undertaking and property, present and future, including uncalled capital, and benefit of certain agreements, contracts, etc., dated December 30th, 1915 (supplemental to charge dated October 17th, 1906), to secure £4,600. Holders: County of London Electric Supply Co., Ltd., Moorgate Court, Moorgate Place, E.C.

David Anderson and Co., Ltd.—Particulars of £5,500 debentures, created July 21st, 1915, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £100. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

Issue on December 17th, 1915, of £3,200 debentures, part of a series of which particulars have already been filed.

Ellis and Ward, Ltd. (107,215).—Capital, £10,000 in £1 shares. Return dated September 28th, 1915. 6,703 shares taken up; £703 paid; £6,000 considered as paid. Mortgages and charges: Nil.

Credenda Conduits Co., Ltd. (126,340).—Capital, £50,000 in £1 shares. Return dated July 7th (filed November 18th), 1915. All shares taken up; £30,000 paid; £20,000 considered as paid. Mortgages and charges: Nil.

Hong-Kong Tramway Co., Ltd.—A memorandum of satisfaction to the extent of £300 on October 26th, 1914, of trust deed dated July 1st, 1903, securing £105,000, has been filed.

Electric Reduction Co., Ltd. (54,724).—Capital, £50,000 in £1 shares (10,200 pref. and 33,800 ord.). Return dated December 7th, 1915. 16,200 pref. and 28,800 ord. shares taken up; £1 per share called up on 33,800 pref. and 3,000 ord.; £18,000 paid; £37,000 considered as paid on 3,200 pref. and 38,800 ord. shares. Mortgages and charges: £25,000.

M. & G. Truck and Engineering Co., Ltd.—Particulars of £1,500 debentures, created January 5th, 1916, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £1,400. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

Resisto-Electrical Manufacturing Co., Ltd.—Issue, on October 11th, 1915, of £900 debentures, part of a series of which particulars have already been filed.

Monte Video Telephone Co., Ltd. (27,208).—Capital, £100,000 in £1 shares (67,000 pref.). Return dated November 10th, 1915. 56,492 pref. and 72,604 ord. shares taken up; £139,172 considered as paid. Mortgages and charges: Nil.

Newtons, Ltd. (48,936).—Capital, £40,000 in £10 shares. Return dated October 5th, 1915. 3,265 shares taken up; £18,650 paid; £14,000 considered as paid. Mortgages and charges: £14,000.

Pirelli, Ltd. (103,058).—Capital, £8,000 in £5 shares. Return dated September 13th, 1915. £8,000 paid. Mortgages and charges: Nil.

Capo Electric Tramways, Ltd. (54,636).—Capital, £500,000 in £1 shares. Return dated November 21st, 1915. 491,222 shares taken up; £91,222 paid; £400,000 considered as paid. Mortgages and charges: £391,300.

Fredrick Braby and Co., Ltd.—Capital, £400,000 in £10 shares (2,500 pref.). Return dated September 2nd, 1915. 27,500 ord. and 2,500 pref. shares taken up; £10 per share called up on 24,250 ord.; £5 per share on 3,250 ord. and £10 per share on 2,500 pref.; £257,020 paid (including £20 paid on 5 shares forfeited); £14,000 considered as paid, being £4 per share on 3,250 shares. Mortgages and charges: £55,000.

General Accessories Co., Ltd. (104,464).—Capital, £3,000 in £1 shares (1,500 six per cent. pref., 920 five per cent. pref., and 500 ord.). Return dated August 10th (filed December 10th), 1915. All shares taken up; £1,580 paid; £1,120 considered as paid. Mortgages and charges: Nil.

Ruthin Electric Supply Co., Ltd. (138,021).—Capital, £3,000 in 400 pref. of £5 each and 1,000 pref. ord. and 2,000 ord. shares of £1 each. Return dated December 8th, 1915. 126 pref., 673 pref. ord., and 1,110 ord. shares taken up; £2,388 paid, leaving £25 in arrears. Mortgages and charges: Nil.

Railway Finance and Construction Co., Ltd. (72,015).—Capital, £100,000 in £1 shares. Return dated November 13th, 1915. 92,292 shares taken up; £1 per share called up on 637 and 48. per share on 29,655 shares; £8,576 paid; £85,716 considered as paid, being £1 per share on 62,040 shares and 16s. per share on 29,655 shares. Mortgages and charges: Nil.

Electro Flex Steel Co., Ltd.—Issue on December 30th, 1915, of £4,000 debentures, part of a series of which particulars have already been filed.

Lamplough and Son, Ltd.—Memoranda of satisfaction in full on December 16th, 1915, of two debentures and a mortgage created by the receiver, and dated June 17th and January 4th, 1913, and May 14th, 1914, securing £500, £700, and £1,500 respectively, have been filed.

CITY NOTES.

French Electrical Companies.

The *Compagnie d'Electricité de l'Est Parisien (Est Lumière)*, which has a share capital of £400,000, reports net profits and balance forward amounting to £55,000 for 1914-15, which has been transferred to the special reserve fund. No dividend was paid either in 1913-14, when the net profits of £39,000 were carried forward.

The *Compagnie Electrique de la Loire et du Centre*, which reports a large reduction in the gross profits in 1914-15, records net profits of £59,000, as contrasted with £95,000 in 1913-14, which sum was carried forward. These two amounts permit of the payment of a dividend of 6 per cent., and the appropriation of £90,000 for the general reserve fund for redemption.

The *Compagnie d'Electricité de l'Ouest Parisien (Ouest Lumière)* reports a great decline in the receipts in 1914-15, the profits being £65,000, as against £124,000 in 1913-14. Including the balance brought forward from the previous year, the net surplus available amounts to £107,000, which permits of the payment of a dividend of 6 per cent., as contrasted with no distribution in 1913-14.

The working results of the *Société d'Electricité de Paris* have been seriously affected through the war. According to the accounts for the year ended with June 30th, 1915, the gross profits amounted to £158,000, as compared with £275,000 in the previous year. By reducing the sum usually set aside for depreciation and renewals, the net profits have only declined from £105,000 in 1913-14 to £91,600 last year, the dividend being fixed at 16s. per share.

The report of the *Compagnie Générale d'Electricité, of Paris*, for the year ended with June 30th, 1915, states that the net profits amounted to £121,000, as compared with £148,000 in the previous year, when any distribution of profits was postponed. It is now proposed to pay a dividend at the rate of £1 per share for each year, to place £160,000 to a special reserve fund for current risks, and to carry forward the sum of £32,000. The allocation of this large sum to the reserve fund is explained by the statement that the company's liquid funds are scanty, whilst the great fluctuations in prices in the metal market may give rise to unexpected demands. The payment of the dividends is deferred for the present owing to the funds being provisionally tied up.

The *Société Industrielle des Téléphones, of Paris*, whose manufactures are in special request in connection with the work of national defence, reports that although the State is now the principal customer, private firms continued to place orders fairly regularly in 1914-15. Out of the six works, of which five are in the vicinity of Paris, only that at Calais suffered from the prevailing circumstances, as it had to be closed, and was occupied at present by the Belgian Army. The Calais works, which produces submarine cables, would have experienced the results of a lack of work even if events had not induced the directors to shut down. The net profits are returned at £69,000, as compared with £71,000 in 1913-14.

the reduction being due to the allocation of £14,000 to the needs of the workmen who have been mobilised. It is intended to pay a dividend of 12½ per share, as against 9s. 7d. per share in 1913-14, the former rate reaching the level of that prevailing prior to the war.

The *Société d'Applications Industrielles de l'Électricité*, which is an investment company in which are interested the Swiss Bank Verein and the Swiss Motor Co. for Applied Electricity, proposes to carry forward the net profits of £19,000 realised in 1914-15, as in 1913-14, when the net profits reached £32,000. In explanation of this intention, the directors state that two subsidiary undertakings—the *Énergie Électrique du Nord* and the *Est Électrique*—are situated in the districts occupied by the enemy, and no accounts were therefore available. Many other companies with which the Trust is also financially concerned had either reduced or omitted the payment of dividends under the existing conditions in order to keep their resources liquid for any eventuality. In addition, the cost of producing electrical energy, particularly in the case of steam power stations, had greatly increased in consequence of the dearth of coal, whilst the receipts of individual companies, which in normal years rose by 15 per cent., had fallen by that percentage in the past year.

Transport Companies in Berlin.

It appears that the traffic receipts of the electric tramways and the elevated and underground railway in Berlin have recently so much improved that it is claimed that these two undertakings have now recovered from the unfavourable influence of the war. Although information is not available concerning the working expenses, figures which have been published in that city show that the gross receipts of the Berlin Grand Tramways Co. amounted to £2,102,000 in 1915, or £57,000 more than in 1914, but £21,000 less than in 1913. The gross receipts of the Berlin Elevated and Underground Railway Co. were £152,000, or £52,000 less than in 1914 and £16,000 less than in 1913. On the other hand, the Berlin General Omnibus Co., whose horses and motor buses were requisitioned very largely by the Army authorities, reports receipts of £362,000 in 1915, this total being less by £221,000 than in 1914, and less by £301,000 than in the previous year. Since last August the returns issued monthly by the tramway company have shown that the large decreases which commenced on the outbreak of the war have been regularly reduced. In fact, the receipts in August, September, October, and November reached the level of those which obtained in the corresponding months in the peace year of 1913. At the same time, the diminution in the receipts during the war, which attained the maximum of £33,000 in September, 1914, must not be ascribed exclusively to the war, as the tramway company's receipts began to decline slightly in September, 1913, on the opening to traffic of the Schenkerstrasse section of the overhead and underground railway. The diversion of traffic by the latter, however, seems to have now ascended to its maximum position, and any further appropriation of traffic seems out of the question in the near future. In a similar way the electric railway company appears to have surmounted the difficulties created by the war. Although the company's receipts in the last months of 1915 were on the average 16 per cent. less than in the equivalent months in 1913, the receipts since September have regularly advanced as compared with the corresponding months in 1914, and the total decrease of £52,000 in 1915 as against 1914 is attributed exclusively to the working results in the first seven months of the year. The recovery of both undertakings, as will be understood from the great reduction in the traffic of the omnibus company, has been effected at the expense of the latter, although this is immaterial financially, as the tramway company and the railway company each hold one-third of the ordinary shares in the omnibus undertaking. It is, however, questionable whether the latter, even if its full complement of horses and motor buses had been available, would have endeavoured to cultivate traffic under the existing conditions incidental to the higher cost of maintenance due to the great cost of fodder and benzine on the one hand, and the low fares on the other, which would probably have resulted in insignificant profits after provision had been made for depreciation.

German Electrical Companies.

The *A.G. für Gas und Elektrizität in Coblenz*, whose expectations as to a progressive improvement in the situation of the undertaking have been unfulfilled through the war, will be unable to pay any dividend for 1915 as was also the case in the previous year.

The *Elektro-Osmose, A.G.*, of Berlin and Frankfurt, reports that the development of the undertaking in 1914-15 was greatly hampered through the war, and the carrying out of a number of installations had, therefore, to be postponed. On the other hand, considerable progress was made in the technical scientific work. As a result of the year's operations a loss of £14,000 was incurred, thus increasing the debit balance to £41,000 on a share capital of £150,000.

The financial statement of the *Kontinental Telegraphen Compagnie*, of Berlin, for 1914-15, indicates a loss of £3,400 on the telegraph business, as compared with profits of £2,500

in the previous year, but the income from investments was £3,500, as against £5,000. Including the balance brought forward, the accounts show net profits of £250, as contrasted with £5,200, and no dividend is in contemplation, whereas a rate of 1½ per cent. was paid for 1913-14.

The *A.G. für Stickstoffdünger, of Kempten*, reports that operations were practically at a standstill in the first months of the war, and it was only towards the end of 1914 that it was possible gradually to bring the plant into full working with the exception of the ammonia factory. The large demand for nitrogen then rendered it possible fully to utilise the installations. As a result of the rupture of the contract on the part of the English, French, and Italian constituents, the Berlin Sales Bureau for Nitrogenous Fertilisers was dissolved, and the International Carbide Syndicate had also collapsed. The net profits realised by the Kempten company in the year ended with June, 1915, amounted to £45,000, as contrasted with £25,000, and a dividend of 10 per cent. is recommended on the share capital of £150,000, which has now been increased to £100,000, as compared with 6 per cent. in 1913-14.

The directors of *Siemens Elektrische Betriebe, A.G., of Berlin*, reporting on the year ended September 30th, 1915, state that although the war exercised an unfavourable influence on the various supply works owned and leased by the company, the value of the total connections increased by over 10 per cent., and the receipts by about 7 per cent. In peace times, however, the augmentation would have been considerably greater than was represented by these percentages. On the other hand, the working expenses largely advanced owing to the dearth of coal and materials and higher wages. After appropriating £28,000 for depreciation, as compared with £24,000 in 1913-14, and placing £15,000 to the renewal fund, as against £13,000, the net profits are returned at £82,000, as contrasted with £75,000 in 1913-14. It is proposed to pay a dividend of 5 per cent., as compared with 6½ per cent. in the previous year, the participating ordinary share capital of £1,500,000 being greater than in 1913-14.

The *A.G. für Elektrizitäts Anlagen, of Berlin*, which owns a number of electricity works and also controls the share capital of various supply companies, reports that the company's interests were not unaffected through the war. The heavy decline in the consumption of current in connection with the German works, which occurred in the initial months of the war, was subsequently followed by a great recovery, with the final result that at the close of the year 1914-15 the receipts in the case of some of the works exceeded those in the previous year. At the same time, the expenses increased everywhere owing to the advance in the cost of materials and of wages, and through the allowances granted to the families of the employees who were called to the Army. No definite information had been received for some time past in regard to the Russian interests—the *Imperial Co. for the Production and Distribution of Electrical Energy*, of Brussels, and the *Moscow Electric Power Transmission Co.* The accounts exhibit net profits of £15,000 as in 1913-14, and a dividend of 8 per cent. is proposed as in the previous year.

Swiss Electrical Companies.

The working of the *Compagnie de l'Industrie Électrique et Mécanique, of Geneva*, was prejudicially affected in 1914-15 through the war and the general mobilisation. It is stated that the year's trading resulted in a loss, as was also the case in the preceding twelve months.

The *Watt, A.G. für Elektrische Unternehmungen, of Glarus*, which company is associated with the Zurich Bank for Electrical Undertakings, is interested in two Swiss electricity works and the Spanish Electricity Co., of Seville. Including the balance brought forward, the accounts for 1914-15 exhibit net profits amounting to £18,000, as compared with £26,000 in the previous year, and a dividend of 5 per cent. has been declared on the ordinary paid-up capital of £280,000, as contrasted with ½ per cent. in 1913-14.

The report of the *Elektrizitäts Werk Lonza, of Basle*, states that the situation in 1914-15 developed beyond expectation, and the works were again set in operation after a temporary interruption in the early months of the war and were now fully occupied. An increase took place in the turnover in calcium carbide and in ferro-silicon, and in other iron alloys, and the artificial silicon-carbide and abrasives were also in demand. The market for cyanamide was specially animated owing to the scarcity of Chilean nitrate. After overcoming the difficulties caused through the war, the company at Waldshut was able to start working. The other undertakings in which the Lonza Co. is also financially interested suffered from the effects of the war at first, but an improvement subsequently took place. The accounts of the Lonza Co. indicate gross profits of £91,000, as contrasted with £80,000 in 1913-14, and net profits of £18,000, as against £12,000. It is intended to pay a dividend of 6 per cent. on the ordinary share capital of £480,000, as compared with 5 per cent. in 1913-14.

The *Columbus, A.G. für Elektrische Unternehmungen, of Glarus*, which is a financial company belonging to the Brown-Boveri group, and which controls the majority of the shares in the *Compañía Bolso-Argentina de Electricidad of Buenos*

Aires, and the central stations at Dolores, Corrientes, and Pergamino, states that the war delayed the delivery of materials and caused difficulties in the sea transport, so that the extensions at the stations at Buenos Aires were retarded. The plant first completed there was of 18,000 k.w., and the contracts concluded by the end of June, 1915, represented 15,000 k.w., apart from the supply of energy to 2,000 public arc lamps. In addition, a contract had been entered into with the State for supply to the harbour works. The other three stations mentioned were also in course of satisfactory development. The accounts show gross profits of £59,000 for 1914-15, as compared with £8,000 in 1913-14, and net profits of £46,000, as against £5,700, and a dividend of 5 per cent. has been declared on the ordinary paid-up capital of £680,000, this rate contrasting with no distribution in 1913-14, which was the first complete business year.

Yorkshire (West Riding) Electric Tramways Co., Ltd.—The report for the year to December 31st, which is to be submitted at the annual meeting to-day, states that, after providing for all expenses, including repairs, maintenance, and debenture interest, the net balance is £29,310, plus £10,725 brought forward, making £40,035. A dividend of 6 per cent. per annum, less tax, on cumulative preference shares absorbs £12,028, and there is to be placed to depreciation, renewals, reserve fund in lieu of accident insurance, general reserve, etc., £12,962, carrying forward £15,045.

Western Union Telegraph Co.—The directors announce that the earnings report for the year ended December 31st last show revenue and income \$52,356,286; expenses, including maintenance and reserve, \$40,802,317; interest on bonds \$1,335,588; net income, \$10,218,381. The figures for the corresponding period in 1914 showed a net income of \$3,371,395.—*Financial Times*.

East London Railway Co.—The number of passengers carried during 1915 was 8,497,284, against 6,172,121 in 1914.

Electrical Utilities Corporation, Ltd.—A quarterly dividend of $\frac{1}{4}$ per cent. on the preferred stock has been declared for the quarter ended December 31st.

Brazilian Traction, Light and Power Co., Ltd.—The directors announce a dividend of 1 per cent. on the issued ordinary capital stock.

Sao Paulo Tramway, Light and Power Co., Ltd.—The directors have declared a dividend of $\frac{2}{4}$ per cent. on the issued common stock.

Montreal Light, Heat and Power Co., Ltd.—The directors have declared a dividend of $\frac{2}{4}$ per cent. on the quarter ending January 31st.

Rio de Janeiro Tramway, Light and Power Co., Ltd.—The directors announce a dividend of $\frac{1}{4}$ per cent. on the capital stock.

STOCKS AND SHARES.

TUESDAY EVENING.

Cheerfulness is the prevailing note in the Stock Exchange markets. There is a fair amount of business doing in most of the "live" sections; while in that for rubber shares, although the activity received a sharp check towards the end of last week, in consequence of a break in the price of the raw material, a recovery in the latter has given a gentle stimulus to fresh orders, and the share market is recovering again. More trade is passing, too, in Home Railway stocks, the nearness of the dividend declarations importing fresh interest. The news from Central and South America is not conducive to better prices in the securities connected with the various countries concerned.

The Home Railway revival started with improvement in some of the preferred stocks of the leading companies. As soon as buyers came in, it was obvious that proprietors of stock were by no means anxious to part with their holdings; and it required very little demand to hoist prices materially. The Underground issues have shared slightly in this better feeling throughout the market; but so far as "Mets." and Districts are concerned, both stocks are, of course, more or less speculative, and therefore swayed by the tendency which prevails in the Stock Exchange as a whole, rather than by rises in such sober-sided stocks as North-Westerns and the like. Underground Electrics are keeping steady, the income bonds and the "A" shares receiving most attention at the present time. As regards the £10 shares, the demand has slanted off to a noticeable extent; and less is heard now of the hopes current a fortnight ago as to the possible payment of a dividend on the shares before long. However, the pooling arrangement between the various Tube companies will soon be coming into operation, and expectation runs high of the savings, and the increased revenue, that they should bring in their train.

The District Railway, by the way, has found it necessary to overhaul its generous concessions to season-ticket holders, whereby it accepted a season ticket on deposit and added the full time to the next renewal of the ticket—an excellent

arrangement from the holder's point of view, when he went away for summer or other holidays. Difficulties in the working of the system and the many abuses that have arisen are adduced by the company as the reasons for modifying the concession to the extent of making it obligatory upon the holder to deposit his ticket for a minimum period of 28 days, in respect of which he will be allowed 14 days on the next renewal taken up. This regulation is also to apply to season tickets between the District and its associated companies—namely, the London Electric, City & South London, Central London, Metropolitan and East London Railways.

The East London Railway report shows that 8½ million passengers were carried last year, an increase of 2,320,000 over 1914. The meeting will be held next Tuesday, January 25th. Bargains have been done in the ordinary stock this week at 31 and 3½.

News from Mexico is less indefinite, but less favourable, than had been hoped. Huerta, the strong man, is dead. He was looked upon as a useful second string if the Carranza régime were overthrown, either by diplomatic or military exigencies; indeed, many people in this country thought that Huerta would make a better President for the stormy State than Carranza. Various other generals are said to have relinquished this life in more or less summary fashion, and it seems as though conditions were once more drifting towards mere chaos. Therefore, Mexicans of all kinds are dull and depressed. Certain of the industrial bonds that were saleable are no longer so; and although the falls are comparatively small in the securities quoted overleaf, the present situation is that there are practically no buyers.

Brazil Tractions fell to 50, on a drop in the Brazilian exchange to 11½; but the price recovered $\frac{1}{2}$, leaving it $\frac{1}{4}$ better on the week, thanks to the declaration of a dividend of 1 per cent. on the common shares. This was just 1 per cent. more than some of the pessimists had prophesied; but so long as the exchange question is so unsatisfactory, these apprehensions are bound to recur every quarter when the time for the dividend declaration draws near.

There is a little interest being taken in Canadian industrials, including those of the various power companies that are known to be engaged in munition work; and an unusually hopeful speech from the Chairman of the Bank of Montreal at last week's meeting has been of assistance to Dominion securities as a whole—more particularly those of the railroad and industrial concerns.

Anglo-Argentine Tramways are decidedly hard, and the First preference shares rose $\frac{1}{2}$, possibly in sympathy with the strong efforts being made by American interests to acquire a controlling hand in Argentine railway companies. British Columbia preference is ex the dividend of 2½ points, but there is not much doing in the stocks of the company.

The intention of the Swiss Government to transform all its federal railways into an electrified system has been a matter of considerable comment. The estimated cost is put at twenty million pounds sterling—an amount which, before the European war educated us to think in millions, would have been regarded as an exceedingly large sum to raise. It is a matter for mild curiosity where the Swiss Government is going to get its money; because, unless it has a very substantial chest in reserve, it will have to go to the Western hemisphere, since the British Government is scarcely likely to permit investors in this country to use their money for such a project as that mentioned.

Falls of $\frac{1}{2}$ in Chelsea and in Metropolitan preference are the only changes in the list of home electricity shares. County of London keep steadily about 10, at which price, and a little over, there are buyers, whom holders are not anxious to supply, having regard to the proximity of the dividend announcement and the probability that it will be a satisfactory one. British Westinghouse preference keep very firm at their advanced price of 45s., and small improvements have taken place in both classes of Electric Construction shares.

The Telegraph market continues to attract investors, whose principal difficulty it is to secure the shares for which they have a fancy. Eastern Extensions, unchanged in price, are ex their dividend of 2s. 6d.; while Eastern Telegraph ordinary, also ex dividend, shows an actual rise of $\frac{1}{2}$. The latter is now on the same plane as Western Telegraph shares, which have risen to 12½. Marconis are a better market, the parent shares improving in consequence of sharp rises in American Marconis and Canadians. The United States has been buying American Marconis freely, with the result that the price is up to 18s. 6d.; while Canadians have been bought with them, and, from 5s., went to 7s. 6d. in the course of a few days. Telegraph Constructions and India-Rubber shares both have rises of 10s. to their credit. Henleys for some time past have been difficult to pick up at all, but there has been rather more supply just lately; though when these shares are taken it will probably be as difficult as ever to get others.

Rubber slid from 4s. 8d. per lb. to 3s. 6d. per lb. in about a week, the drop unsettling the nerves of speculative investors who had been buying so freely while the raw material was on the rise. Business was brought to an abrupt halt, and there was a general turn round in prices. On rubber picking up a little, confidence followed suit; but there is nothing like the volume of trade being done that characterised the market a week or ten days ago. The iron and steel shares are mostly firm. Castner-Kellners at 3½ are the fraction to the good. The armament market is also harder. In fact, the industrial departments all round show noteworthy strength.

Coal Prices and Charges to Electricity Consumers.

—In the House of Commons, Mr. Will Thorne asked the President of the Board of Trade whether he was aware that the metropolitan borough of Islington had sent a circular to its electricity consumers, stating that in consequence of an advance of nearly 70 per cent. in coal prices the Council was compelled to increase the price of electricity commencing with the March quarter, and whether, seeing that the expectancy that charges for coal would be materially increased had not been realised, he would take further action in the matter. Mr. Pretyman, in reply, said he understood that the Borough Council of Islington had sent out such a circular. The electric lighting order under which the Council supplied electricity fixed the maximum charges which might be made to consumers. Electric lighting undertakers were acting within their statutory powers in varying their prices so long as the prescribed maximum was not exceeded. He presumed that the pitmouth price of the coal the Council was buying complied with the provisions of the Price of Coal (Limitation) Act.

Copper.—The largest purchase of copper ever made has recently been negotiated by the British Government in America. According to New York papers, the contract is for 135,000,000 lb. of the metal.—*Times*.

MUNICIPAL ELECTRICITY SUPPLY AT JOHANNESBURG.

By R. TURNBULL MAWDESLEY.

THE vicissitudes of the municipal power plant at Johannesburg—from its inception in the pre-war days, down to the period of the gas engines whose absolute fiasco is still a green memory—need not be more than touched upon in this article.

In the early days, Johannesburg achieved an unenviable notoriety in the electrical world, for unreliability in its electric supply, which has taken some years to live down. This particular region of South Africa was then often very dark indeed. The lay Press used to wax mildly satirical on the subject of the trustworthiness of electric lighting and power; there were published rude caricatures of tram-cars left forlorn upon the tracks, showing weeds growing up in abundance, between the track sets. In fact, ridicule was poured upon the scheme by all and sundry; and it is on record that ancient horse-drawn cabs used to follow cars bound for distant suburbs, secure in the knowledge that such cars would never reach their destinations.

In the days of the gas engines, it was no unknown thing for 20 or 30 natives to be "gassed" in one day; and old hands tell tales of the remarkable antics of white men, fresh from home, who, in some manner transcending the bounds of natural knowledge, became imbued with the indecorous spirit of the gas-engine room and behaved shamefully. One hears, too, of the seizure of "big-ends," and the indiscriminate scattering of white metal—what time the operating staff was outside in the fresh air, seeking recovery from the effects of the noxious fumes.

All that has been changed. Since the gas engines were scrapped, the municipal power station has gradually come into its own; and it is slowly but surely assuming its proper place in a town of the size and commercial importance of Johannesburg.

Johannesburg is situated on the southern slope of the Witwatersrand Range, and is about 6,000 ft. above sea level. Its population varies a great deal, but approximately there are now 130,000 whites and 150,000 coloured people. It is, historically, one of the most remarkable towns in the world—not excepting some of the mushroom towns which sprang up in America and Australia at the times of the gold rushes. In September, 1886, when the gold diggings were proclaimed by State President Kruger, the population of the township was only 50. To-day, notwithstanding the fact that it is, roughly, 1,000 miles by rail from Cape Town, and 600 miles from Durban, and connected to these coast towns for the most part by single-track railway, Johannesburg is a stately city. Its massive stone buildings, its wide roads, pavements, lighting and water, its tramways and means of communication, its police, with native police—"boys," to keep in order the hordes of semi-civilised Kaffirs; and, finally, its commercial and financial interests, are worthy of any European centre. Its association with the largest British power scheme will be known to all—though the Victoria Falls and Transvaal Power Co. have not, it is understood, any rights within the municipal area. The stability of the gold-mining industry is everywhere apparent, and not the least of Johannesburg's treasures is the South African School of Mines and Technology. Such is Johannesburg to-day.

It was perhaps unfortunate that some comprehensive scheme of power supply was not laid down by the Council of Johannesburg at first, as there could have been little doubt, even in the early days, that the future of the town was assured. It has been a gigantic and laborious task to undo the great amount of harm, caused—inocently enough, it may be—by the pioneers of the industry in South Africa.

Johannesburg was singularly unfortunate in having, first, an old-fashioned steam plant (belt-driven bipolar generators with horizontal engines); and secondly, in replacing these at great cost, by gas engines whose performance certainly did not come up to expectations, and whose failure left the city in a quandary.

The repeated failures of supply caused positive consterna-

tion in the city, and the subsequent law suits and recriminations are too well known to be recapitulated.

Gradually, however, a modern plant has been installed, whose reliability leaves little to be desired; its equipment has been brought up to date as quickly as circumstances have permitted, and to-day a "shut-down" is a distinct exception, rather than the previous rule.

The Gas, Electric Supply and Tramways Department of the Municipal Council of Johannesburg is at present managed by Prof. J. H. Dobson.

The principal power station is situated in President Street West, and is built upon a site adjacent to the original stations—the general offices, car-sheds and power station forming a compact group of buildings to the west of the city proper. There is a small gasworks to the north of the power station, which is managed by the same department; but little gas is used for illuminating purposes, the connections (numbering 470 at the end of November, 1914,) being mostly to hotels and restaurants, for cooking purposes. (During November, 1914, three million cubic ft. of gas were produced.)

The monopoly for lighting and power purposes is therefore held by the Electric Supply Department (within the municipal areas), and this is no mean consummation in the largest and most important city in Africa.

The original distributing system gave as much trouble as the generating plant, but this has been remedied as quickly as possible by the replacing of faulty feeders and distributors, as well as the laying of duplicate (in some cases quadruplicate) feeders. Considerable extensions in cable-laying have been, and are being, carried out, and the whole scheme is being brought up to modern ideas of maintenance and operation.

The present system, both as regards the generating plant and the distribution, is the outcome of a lengthy report, drawn up by Mr. Dobson in June, 1911, which contained an exhaustive survey of the original system—if system it could be called—and enumerated the alterations to be made both at the power station and on the lighting network, the object being to arrange for the installation of subterranean distribution, or link, chambers, at the busy centres, each with a duplicate feed, and the splitting up of sections by means of pillars above ground.

All this meant the removal of old and perished cable, disconnecting boxes, &c., and as a result the present system begins to stand out in strong contrast to that of 10 years ago.

Dealing first with the generating plant as at present installed at the principal power station, the capacity of steam-driven generators is 13,500 kw., made up as follows:—

No.	Capacity.	Make.		kw.
1	3,000 kw	Belliss - Lahmeyer turbo-alternator	2-phase	3,000
2	3,000 "	Belliss Siemens turbo-alternators	2 phase	6,000
1	1,000 "	Belliss-E.C.C. reciprocating	2-phase	1,000
1	1,000 "	Belliss-Siemens "	d.c.	1,000
1	1,000 "	Belliss-Dick, Kerr "	d.c.	1,000
1	500 "	Belliss-Dick, Kerr "	d.c.	500
1	500 "	Belliss-E.C.C. "	d.c.	500
1	250 "	Allen-Mather & Platt	2-phase	250
1	250 "	Allen-Mather & Platt	d.c.	250
10	13,500 kw.	Total...	kw.	13,500

There is also installed in the main generating station some 4,000 kw. of motor-converting plant, the direct-current from which may be used either for d.c. lighting in the inner area of the town, or for traction purposes, as explained further on. The 250-kw. Allen reciprocators each have a two-phase alternator and two direct-current generators rigidly connected to the engine shafts in tandem, and it is possible by disconnecting the engine coupling-bolts, to use the A.C. and D.C. machines as motor-generators—the alternators being used as synchronous motors, to drive the D.C. machines, or *vice versa*, whichever may be desired. The starting up, in this case, is accomplished by means of ordinary starting resistances in the D.C. armature circuits.

There are three distinct systems of supply from the generating station, the central parts of Johannesburg (or in e:

area) being supplied, both for lighting and power, by a three-wire direct-current system at 230 and 460 volts. The outlying suburbs are fed by single and two-phase feeders (the latter for power) at 3,000 volts, to step-down transformers (placed in subterranean chambers for the most part) and in kiosks, from which the supply is taken at 200 volts for domestic and street lighting.

There is also a third supply at 600 volts, direct current, for traction purposes—which may be derived from the Belliss D.C. reciprocators or from the motor converters.

In connection with the tramway scheme, one rotary

the upward position (*i.e.*, "on lighting") the machines run as shunt wound; and when it is in the downward position (*i.e.*, "on traction") the series field turns of the D.C. machines are cut in, and the machines run as compound wound. The whole of the D.C. steam-driven generators and the D.C. sides of the converters are slightly over-compounded, which has a dual effect on the converters, bringing the power factor to unity, and sometimes giving a leading current when the machines are doing their full rated load (on traction).

Fig. 3 shows a back view of the main direct-current switchboard, with positive traction bus-bar and feeder panels.

The Belliss-Siemens 1,000-KW. reciprocating set has a middle wire balancing connection. The converters each have a middle wire connection, to the star point of the rotor windings, which is, of course, earthed, and any out-of-balance current is distributed equally over the brush gear of the slip-rings.

The above-mentioned D.C. machine panels are each provided with two ammeters, a voltmeter, and a double-pole automatic circuit breaker—excepting the steam-driven non-balancing generator panels, which have only one ammeter. Plug sockets are provided on each machine panel for paralleling purposes.

The three-wire lighting feeders each have two ammeters, a triple-pole switch (the neutral connection of which is not used), and a double-pole automatic circuit breaker.

The traction feeders each have a single-pole switch or link, an ammeter, and a single-pole automatic circuit breaker. The double-pole lighting circuit breakers are interconnected mechanically, so that if one operates automatically, both circuit breakers open, leaving that particular

FIG. 1.—PART OF MAIN SWITCHBOARD WITH DESK-TYPE H.T. BOARD ON RIGHT.

sub-station at Jeppesstown is at present in commission, for supplying the outlying and congested traction areas. Eventually three such sub-stations will be put into operation, each of which will contain two British Westinghouse rotary converters of 500-KW. capacity. These will receive two-phase current at 3,000 volts, 50 cycles, for conversion to direct current at 600 volts.

The British Westinghouse Electric and Manufacturing Co., Ltd., have supplied the rotaries and transformers for these sub-stations, and the rotaries are of the so-called self-synchronising type.

Notwithstanding the three distinct systems of supply, the switchgear is not complicated, and a general view of the operating panels is given in fig. 1.

The desk type panels to the right control the A.C. supply at 3,000 volts, the alternator control switches and the synchronising gear being shown in the right background, while the single and two-phase feeder switch controls are shown in the right foreground. The 3,000-volt switches are of the oil-break remote-control type, mechanically operated by rods and handles, as shown—the oil switches themselves being contained in separate cubicles, built on a gallery below the operating platform. On this floor, shown in fig. 2, the regulating resistances are also placed, together with the auxiliary plant distributing board.

Referring to fig. 1, the main D.C. switchboard is shown on the left. In the middle portion of the board, four machine panels, for the Belliss direct-current sets, and four converter panels, controlling the direct current from the converters, are placed; the feeders branching to the left are three-wire lighting and power feeders (inner area) and those ranging off to the right are traction feeders. (There are, of course, two separate and distinct sets of bus-bars.)

Each D.C. machine has a main triple-pole change-over switch, the connections being such that, when it is placed in

FIG. 2.—GALLERY UNDERNEATH MAIN SWITCHBOARD: OIL SWITCH CELLS ON LEFT.

feeder isolated. It should be mentioned that each lighting feeder feeds its own area, not being connected, normally, with other parts of the network.

Referring again to the A.C. control panels (fig. 1), the machine panels are each provided with two voltmeters and

two ammeters (one per phase), two watt-hour meters, two power-factor indicators, and the necessary plug sockets for synchronising. The oil switches are operated for overload by the instrument current transformers, and the switch handles each have the customary loose link, so that the switch cannot be held closed on short circuit. The single-phase feeders are so arranged that by the aid of oil-immersed selection links any feeder may be connected either to "A" phase or "B" phase, coloured signal lamps giving a corresponding indication on the desk panels.

The single and two-phase feeder switches are operated for overload by series transformers, the secondaries of which

FIG. 3.—BACK VIEW OF PART OF MAIN SWITCHBOARD.

are connected in series with the ammeters and the switch trip-coils.

Duplicate synchronising gears are installed, one on each phase, and both the alternator oil switches and the feeder oil switches can be completely isolated by air-break links on either side of the switches.

The whole of the switchgear is by Messrs. Siemens Bros. Dynamo Works, Stafford. The original switchgear was placed on the engine-room floor level, but the existing Siemens switchgear is placed on a gallery at one end of the principal generating station.

(To be continued.)

NOTES ON ELECTRIC WELDING PRACTICE.

GREAT progress has been made in every system of electric welding during the twenty-five years or so which have elapsed since its practicability was first demonstrated, but the major portion of this progress has been accomplished during the last ten years, in which many manufacturers have concentrated their attention on the perfecting of special types of welding machines. Even to-day, and to a much greater extent in the past, trade reticence has had considerable effect in checking the extension of electric welding, for those firms who install electric welders find them such a "good thing" that they keep the fact to themselves—which is all right from their point of view, but none too pleasant for the electrical interests involved. However, that particular trouble lies chiefly in the past, and electric welders are now used in innumerable manufacturing processes, many of which would be commercially impracticable without electric welding.

The two broad classes into which electric welding applications may be divided are: (1) repair work and construction by building up—requiring skill; and (2) routine manufacture of parts in bulk—demanding, on commercial grounds, processes for which no special skill is necessary. There are innumerable manufactured parts now in daily use which could be made more cheaply from two or more pieces (instead

of as a single casting, stamping or spun part), if only the component pieces could be joined cheaply and neatly. This is possible by electric welding, and the fact finds ever wider recognition and application.

Applicability.—It is undeniable that electric welding methods are by far the most widely applicable. Any "proposition," and any metal or pair of metals which can be welded by any other system of welding can be welded electrically but the converse is by no means true, for electric welding can do much that is impossible by other means. Primarily, electric welding alone can be reduced to a *machine process*, and this is of immense importance in manufacture; but naturally not all electric welding is mechanical. Judgment and skill are frequently required in its application, particularly where arc processes are concerned. One or other of the various possible methods of electric welding is applicable to practically every metal or combination of metals, whatever the mechanical form of the latter and, in particular, to many commonly employed metals which cannot be welded by any other means owing to their deterioration at high temperatures, rapid oxidation, or some other unfavourable characteristic. Copper and aluminium, for instance, can be welded perfectly by electric butt or percussion welding. Wrought iron, mild steel, and even high carbon steel are regularly dealt with, whilst nickel steel is very easily welded electrically.

Composite welds, such as nickel to brass; brass to iron or steel or platinum; aluminium to brass or copper; platinum to iron or brass; German silver to wrought iron, copper or brass; and practically any grade of iron or steel to any other (*e.g.*, mild steel shanks to costly alloy steel tools or mild steel bars on to drop forgings)—all such welds and many others can be performed electrically and by no other means. As for the mechanical aspects of the work which can be performed, this ranges from plain "filling," butt, lap, scarf and angle welding to the most intricate combinations and multiplication of these operations. Bosses round holes may be formed by welding on rings after drilling or discs before drilling; all kinds of metal netting and lattice work can be performed in automatic electric welding machines; and tube seams can be closed, spokes attached to hubs, and all kinds of hardware and other sheet metal work built up by electric welding instead of soldering, brazing or riveting.

Strength of Weld.—Papers devoted specifically to consideration of the strength of electrically welded joints of all kinds have been read in considerable number, and it is neither practicable nor necessary to attempt to summarise the mass of data now available; but all data go to show that electric welds are invariably much stronger than hand welds (where the latter can be made), and generally stronger but never weaker than those made by gas flame methods. In the series of steels, the higher the percentage of carbon or other alloyed ingredient the greater the superiority of electrical over other welding methods.

It is an old precept that welded joints should be adopted very cautiously in working machinery and wherever failure would involve danger to life, the working stresses being made very low in such cases. This precept was and is a good one, but electric welding ensures such soundness in the weld itself and so little affects metal on either side of the joint that the union can be trusted in most responsible positions. For example, armature shafts, chain links, cables, and machine components are all regularly welded electrically. In short, electric welding has taken, and is quite competent to take, rank as a regular machine shop process in construction and repair. It is only necessary to recognise, as with any process, certain fundamental precautions in practice and design.

Methods.—All methods of electric welding depend fundamentally on the Joule effect, *i.e.*, on the conversion of electrical to thermal energy by resistance

interposed in the electric circuit. Nevertheless, the term resistance welding, of which there are several varieties, is generally applied to systems utilising contact resistance between the pieces joined. Arc-welding systems utilise the contact resistance between arc crater and incandescent vapour column, and the heat thus generated may be applied quite externally as regards the work, or the latter may be made one electrode so that heat is again, in a sense, due to contact resistance on the work, but with this *very important difference* that an arc being struck, there is a definite and very high temperature at the crater and heating is intense, more local and less under control than in ordinary resistance welding. When the arc is between two independent electrodes, manipulated as a sort of blowpipe, heating of the work is more under control as regards rate, distribution, and degree, if the worker has the requisite manipulative skill. The Hohe electrolytic process is a modification of butt-resistance welding, the contact resistance being between the electrolyte and the work, and due chiefly to a polarisation layer of hydrogen.

Arc Systems.—There are quite a number of electric welding systems coming under this heading, but all are “autogenous” in their action, *i.e.*, metal is actually melted to form a joint of cast structure. By feeding the arc with suitable materials it is possible to produce joints of widely varying compositions, but all arc welding processes are essentially processes for craftsmen. They require considerable skill to ensure satisfactory results, the difficulty being that the arc temperature is really considerably higher than desirable and incapable of control. On the other hand, arc welding alone is applicable to miscellaneous repair work and, being essentially a “filling” process, it is very useful in running-in molten metal of approximately any required composition to fill casting blowholes, contraction cracks and other flaws; to build up worn or broken parts and so forth.

An arc welding tool is compact, can be supplied efficiently through a relatively long cable, and can be applied with equal facility to any piece of work, whereas other systems require a more or less specially constructed machine. Also arc welding can often be applied to work which, by its form or dimensions, could not be dealt with by resistance welding. The strength of the original or adjoining section can be equalled or exceeded by building up metal, and it is remarkable what thin ware can be arc-welded satisfactorily by a skilled worker. At the same time, the chief utility of arc welding lies in railway shops, shipyards, rolling mills, foundries, tank and boiler shops, and general engineering works (particularly repair shops), whilst resistance and percussive welding are the systems *par excellence* for repetition and very light manufacture. If the operator is not skilled there is considerable risk of carbonising or introducing other foreign material in arc-welded joints; it is not easy to see precisely what is going on at the working point, and there is always the risk that the work will be burnt on the one hand or remain too cool to unite intimately with added metal, on the other hand.

In the Benardos arc system, fig. 1 (largely used to build up lugs and gear teeth, fill blowholes, joint tanks, pipe flanges and boiler fittings, etc.), an arc is struck between the work to be welded and a carbon (negative) electrode about 1 in. in diameter. The weld is fed from a stick of suitable metal held in the arc, and the latter may consume several hundred amperes at 80 volts or so. By making the work positive, the risk of carbon entering the weld is reduced, and the temperature attained is reduced, for a metal arc crater is cooler than a carbon crater. The functions of negative electrode and “filler” are combined in the Slavianoff system (fig. 2), which resembles the Benardos except that a metal electrode is used, generally $\frac{1}{8}$ to $\frac{1}{4}$ in. in diameter. The current consumption is seldom more than 100 amps.,

and often 20 amps., or less; and the voltage is much lower than for the carbon arc, say 25 to 35 volts. By making the metal electrode *positive*, molten metal is carried on to the work automatically, even when working on the underside of a surface. The metallic arc is very short ($\frac{1}{4}$ in. or less) and very sensitive to pressure variations, so that it is not very easy to manipulate, and it is hardly possible to run two in

FIGS. 1 TO 6.

parallel from one generator. The rather slower working and the complete elimination of carbon are valuable features, particularly in light work. To prevent splashing of molten metal from the feeder and protect it from possible oxidation, the Kjellberg system uses a metal electrode surrounded by a casing which burns to form a crater and a flame arc; the voltage necessary is raised to 100 v., and from 100 to 200 amps. is consumed on boiler and marine repair work. The special electrode is connected to the positive main.

The Voltex, Zerener, and Coffin systems all use two electrodes producing a sort of electrical blowpipe, and permitting considerable control over the zone and degree of heating, which is specially valuable when working on thin sheet goods, welding straps and tube joints, etc. In the Voltex equipment (fig. 3), impregnated carbons set at right angles yield a long flame arc which consumes the carbon vapour and so protects the weld from carbon-hardening. The Zerener carbons (fig. 4) are in Vee-setting with an intermediate deflecting electromagnet; whilst the Coffin arrangement (fig. 5) is very ingenious in conception, and consists of concentric rod and tube electrodes and an electromagnet which causes the arc to run round the annular track provided for it, and so distributes the heating effect. The so-called Quazarc (Strohenger-Slaughter) system (fig. 6) is semi-automatic in nature, and if carefully applied ensures a suitable quantity of “filling” metal in the joint and correct speed of welding with no risk of overheating. A strip electrode of the filling-metal is lightly insulated (with a fluxing composition) and laid along the chamfer of the joint to be made; after once striking the arc at the end of this electrode, it runs along the latter as the metal melts, and $\frac{1}{2}$ to 1 ft. of joint is welded per minute. So long as the right size of electrode and the correct current are employed, and the edges are true and symmetrical, good working is secured with freedom from any difficulty in maintaining arc adjustment. The method is usefully applicable to tank and metal barrel manufacture as well as to heavier work.

(To be continued.)

THE DESIGN OF HIGH-PRESSURE DISTRIBUTION SYSTEMS.

THE paper by Mr. J. R. BEARD, which was abstracted in our issues of December 24th and 31st, 1915, and January 7th and 14th, 1916, was read and discussed at a meeting of the MANCHESTER LOCAL SECTION of the INSTITUTION OF ELECTRICAL ENGINEERS on December 14th, 1915.

Mr. S. L. PEARCE considered the subject of the paper of enormous importance. Engineers were well aware of the advantages of taking extra-high-tension supplies straight into

sub-stations on the consumers' premises, although to do this in the case of consumers having only 100 kw. demand (as suggested by the author) was perhaps open to question. He agreed that reactances were best used in connection with generators, not simply for the protection of any individual piece of switchgear, or even an individual generator, but chiefly for the purpose of preventing the derangement of the whole system in the event of a local fault developing, without dividing the system into a number of sections, or attempting to run the whole system in a most uneconomical way. Mr. Pearce exhibited a slide showing the lay-out of the main switchgear at the projected Barton station to illustrate his point. He agreed that it was impossible to estimate the severity of the fault which any particular switch might be called upon to deal with, and, whatever the capacity of the particular apparatus they might be controlling, the switches should be large enough to deal with any eventuality. Regarding the most economical section of mains, he exhibited a slide appertaining to 0.25 sq. in. 11,000-volt, 20,000-volt, and 30,000-volt cables, and giving figures showing the problem tackled from the point of view of dielectric losses. These were interesting as showing how the conclusions arrived at in favour of the 0.25 sq. in. 30,000-volt cable confirmed the conclusion of the author, who had dealt with the matter purely on the basis of I^2R losses. Figs. 5 and 6 showed that the higher the voltage the greater the maximum current per phase that could be carried, and the more nearly the cross sections of the cables (determined respectively by (a) consideration of economy on the one hand, and (b) safe carrying capacity on the other) approached one another. Fig. 6 would be of the greatest possible assistance to engineers laying out new systems or carrying out extensions to existing systems. The Manchester system was laid out about 14 years ago on the series-radial plan, and with the development of the area and industrial power load the number of sub-stations had increased to over 100. A rearrangement of the system became essential with a view to developing the useful employment of the copper laid, and also increasing the reliability of supply by the adoption of modern protective devices. Wherever possible existing mains were used to form ring mains with balanced-current protective devices, so that the copper would be more usefully employed, especially in outlying districts. The author was correct in stating that reverse power relays were unsatisfactory. His figures seemed to show an enormous difference in price between 20,000 and 30,000-volt switchgear; this did not agree with investigations made by the speaker some little time ago. In conclusion, Mr. Pearce said the trend of experience with modern high-pressure distribution stations, operating over wide areas and dealing with large and concentrated loads, seemed to point to the necessity first of all of choosing a distributing voltage even in excess of 20,000. It was well known that Manchester proposed to adopt 33,000 volts in connection with the Barton scheme. The second point was to employ the largest section of cable commercially possible. This would keep down the number of cables required for the system by the use of a balanced-current protective system, and, again, by adopting fewer cables the total number of switching points was reduced. Lastly, it was desirable to dispense with or limit as far as possible the number of step-down transformer points on the system, which, in other words, meant that the distinction between feeders and distributors was largely vanishing.

Mr. S. FERGUSON said that on a 6,000-volt system the capacity of the generating plant did not materially affect the initial short-circuit current flowing to a sub-station with an average-sized feeder exceeding one mile in length. The current was fixed by the impedance of the circuit, i.e., the reactance of the generator windings and the resistance of the feeder, and in a typical case doubling the capacity of the plant only increased the short-circuit current by about 4 per cent. In both Manchester and Birmingham the sub-station oil switches had not been increased in size, although the capacity of the plant had increased enormously. Increased voltage (other things remaining constant) for the particular length of feeder mentioned made the short-circuit current more directly dependent upon the plant capacity, and it was advisable to bear in mind that the power delivered at a fault varied as the square of the voltage. Regarding interlocks, the most important on any cubicle was certainly the one dealing with incoming feeders. The attendant handling the switchgear could ensure the feeder being dead from the bus-bar side, but he could not answer for the man at the other side. Means should be provided for earthing the feeder or locking the feeder isolating switch chamber.

Dr. E. W. MARCHANT said that while a great deal of attention had been paid to the machinery of generating stations, far too little was given to distributing systems, which represented a large percentage of the capital outlay. Referring to the author's curves, and remarks concerning the most economical section of mains, he said that working out the relationship which existed by Kelvin's law of economy, it would be found that the economical current density in a cable was entirely dependent upon the cost of the cable, the resistance of the material of which the cable was made up, and the cost of energy per unit. Therefore, the economical current density was constant, and this result coincided with the author's tables: the curves between current and cross-section were straight lines, signifying that the current density was the same for all sizes of cable. An increase in voltage would cause the most economical current density for the cable also to

increase. This was also shown by the author's tables, because the current density for a 20,000-volt cable was considerably greater than in the case of a 10,000-volt cable. It was clear from this result that if the working pressure was sufficiently increased and there was adequate insulation, a point would be reached where the economical current density would correspond with the heating limit. Kelvin's law, being founded on a basis of minimum total charge for energy distribution, was unsuitable for determining the most economical current for a cable already laid. The best basis for such a cable was minimum ratio of total cost of producing energy to revenue earned. As a rule, however, the difference was not very great.

Mr. G. HARLOW said the provision of an adequate size of primary winding on series transformers was very often overlooked, and within the past two years he had known at least seven cases of serious short circuits due to this trouble. An investigation of these had led to the adoption of primary windings at least equal in cross-section to the main to which they were connected. Regarding potential transformers on bus-bars, a protective oil switch, as suggested by the author, was absolutely necessary with 100,000-kw. main plant or 50,000-kw. in sub-stations. A breakdown at the transformer terminals was a fearful business, but if it occurred half way down the winding the impedance prevented much trouble. There were many stations where it was advantageous to use feeder reactances. Oil switches in sub-stations about one mile distant from the power station should be of the same capacity as the power-station switches. The speaker asked the author to state how much split conductor was laid on the North-East Coast system, and whether induction reactance was still used.

Mr. A. F. W. RICHARDS said that the curves showed that the cost of making ample provision for future requirements was almost negligible. Another outstanding point was that overhead mains at pressures up to 6,000 volts were not a paying proposition for transmitting power not exceeding 400 or 500 kw., assuming, of course, that there were not other considerations to be taken into account such as shortening route, etc.

Mr. S. J. WATSON spoke of the ease with which sub-stations could be set up when high-pressure distributing mains were adopted, whereas in the past in connection with D.C. systems low-pressure mains were frequently run out a considerable distance from the power station, with consequent difficulties in regulating and giving proper pressure to consumers. Whilst appreciating the author's efforts, he thought that in many cases the section of conductor for high-pressure systems was not worked out by the scientific methods set forth in the paper. Most systems, whether high or low-pressure, usually started in a small way, and when mains were laid there was very little indication where the load would come from. The practice had been to fix on a good-sized section of copper and lay cables in the directions where load seemed most promising. The generating station never by any chance became situated in the best position relative to the distributing system, and this fact appreciably affected not only the original lay-out but also new developments. In Bury the principal consumers were distributed in the form of a star. There was a fairly good demand adjacent to the main roads running out from the town, but between the tips of the star it was mostly waste land, and in an area of this kind a ring system could not be adopted on account of the cost and the large amount of idle cable. An important point was the small difference in cost (2½ to 5 per cent.), which enabled an engineer to increase the capacity of the cables by a very large percentage. A slight increase in copper was usually found to be a sound investment.

Mr. F. FERNIE asked whether the author excepted cables from the statement that no apparatus could be made immune from breakdown through external damage. It might be said that nobody could guard against damage to underground cables by workmen opening up the roads, but he knew of a case where the supply authorities received copies of all permits to open up roads, and by sending an inspector to point out the location of the cables damage of this nature was almost entirely eliminated. It had been reported that Newcastle proposed to use some 11,000-volt cables at 20,000 volts. Perhaps the author would state whether this had been done, or whether the 20,000-volt line of underground cable in fig. 6 would coincide with the 11,000-volt line. It was desired to know what minimum factor of safety the author considered permissible. Some of the 20,000-volt cables in the Newcastle district had a factor of safety of 7 to 8, whereas for 11,000 volts the figure was 10 to 15. By factor of safety was meant the ratio of the maximum stress at which the cable would break down to the maximum working stress. Referring again to fig. 6, some explanation was necessary to show why the inclination of the 20,000-volt line was different to that of the 11,000-volt line.

The AUTHOR, in reply, said that the reference to the use of high-pressure distribution for 100-kw. loads applied only to isolated loads, and in some cases it had been considered worth while to accept 50-kw. loads. Reactances on generating plant were very satisfactory on account of the perfection of modern automatic voltage regulation. The Ferranti-Waters and Callender-Waters systems were quite distinct, the former being a parallel feeder protection and the latter the split-conductor type, requiring a special cable. The Callender-Waters system was in actual use on the South-Western Railway at 3,000 volts. The cost of switchgear had not yet been dealt with in connection with the 30,000-volt gear, but the curve would probably continue upwards at about the same

slope on account of the spacing and thickness of insulation increasing more than proportionate to the voltage. No reference was made to the Ferranti-Waters system because it was not in actual use when the paper was written. An actual case worked out on this system showed the cost to be about 15 per cent. greater than any other system. This seemed inevitable with all systems using parallel feeders. In reply to Mr. Ferguson, 15,000 amperes at high voltage was as much as the best switch would do, and probably very much less would wreck many of the switches at present on the market. Reactances should not be necessary at the sub-stations, and only as a last resource on feeders. The breakdown of potential transformers was not appreciably affected by the size of the station, breakdowns taking place almost as readily in small stations as large ones. It should be a general rule never to put potential transformers direct on bus-bars, even in sub-stations. Generally speaking, they were not necessary in sub-stations, as the main transformer would meet all requirements. Regarding the North-East Coast system, there were 140 miles of split conductor, 385 miles Merz-Price protected cable, and a balance of 185 miles of overload cable, which represented some systems not yet linked up. Approximately, half the original overload protected Tyneside system had been changed over, and the remainder would no doubt be included in due course. Induction reactance had not been used on the split-conductor system for the past two years, but there was still a lot in commission and working perfectly satisfactorily. There was no trouble owing to extensions upsetting existing protective gear.

DISCUSSION AT NEWCASTLE.

At a meeting of the NEWCASTLE-ON-TYNE LOCAL SECTION of the INSTITUTION OF ELECTRICAL ENGINEERS on the 10th inst., Mr. J. R. BEARD read his paper, of which an abstract was given in our issues of December 24th and 31st, 1915, and January 7th and 14th, 1916.

Mr. C. VERNIER, in opening the discussion, said it was surprising, considering how much money had been put into high-pressure systems, that the subject had not been more adequately considered before. Referring to the question of mains, he said Mr. Beard dealt well with the question without deciding whether overhead or underground cables should be preferred. Generally speaking, one ran overhead mains where possible in the open country, and where the necessary wayleaves could be obtained, and it must be remembered that the wayleave question was always a difficult one. He did not think there was much to say against overhead lines, although they had their faults, and it was only a question of time before they got the overhead as perfect as the underground system. With regard to the annual charges for overhead and underground mains, he thought Mr. Beard was a little cautious in taking as a basis for his estimate the life of an underground cable at 22½ years and of overhead lines at 17½ years. The author would agree with him that the life was likely to be more than the time he had mentioned. The diagram showing the annual cost per mile for interest and depreciation rather favoured the underground system, for it was usually possible to get shorter routes for overhead lines than for cables. Referring to the section on the lay-out of the distribution system, he thought the paper was an attempt to prove the case of the interconnected system. To most of them there it did not require proving, but it might elsewhere; but the thorough manner in which Mr. Beard had gone into the matter ought to settle the question of the interconnected system *versus* other systems which were often laid down even now.

Mr. H. W. CLOTHIER referred to the importance of switchgear as the protective system of the general scheme. For years they had been looking into the details of switchgear and overlooking the larger influence it had on the whole scheme. The paper touched on a very important point in connection with the strength of switchgear, and without dealing with the heavy short-circuit conditions, he might say there seemed to be no end to the development of that. He spoke of the difficulty that faced them owing to the growth of systems and of plant beyond what was anticipated when the switchgear was put in. As to the importance of guarding live apparatus, and the statement that it was a simple matter to interlock the guarding arrangements, he submitted that it was a brain-racking thing to interlock and screen all parts.

Mr. G. L. PORTER and Mr. R. W. GREGORY also spoke upon the interconnected system.

Mr. BEARD, in the course of his reply, said that in that district overhead lines had been brought to a very high state of perfection, and he thought, as Mr. Vernier had said, that in the course of time the overhead lines would be almost as immune from breakdowns as were underground mains. As to switchgear, he pointed out the small proportion of cost compared with the whole—about 20 per cent. or 30 per cent. or less.

THE ELECTRIC LOCOMOTIVE.

By F. W. CARTER, M.A., Assoc.M Inst.C.E.

(Abstract of paper read before the INSTITUTION OF CIVIL ENGINEERS, January 11th, 1916.)

ELECTRIC locomotives, particularly those driven by motors of uniform torque, are capable of making better use of their adhesive weight than steam locomotives, with suitable provision for sanding the rails the tractive effort may amount to a third of the weight on the driving-wheels, and the parts should be designed mechanically and electrically on the assumption that this limit is attainable. Locomotives driven by impulsive torque, such as those which employ the single-phase commutator motor, are naturally incapable of exerting so high a mean tractive effort, although the maximum stresses in the parts are likely to be higher.

Most locomotives, particularly those designed for goods service, are required at times to exert as great a tractive effort as the conditions allow, and the control is therefore usually devised in many steps, in order that the tractive effort in starting may, if necessary, be maintained very close to the limit of adhesion without overstepping it by the greatness of the peaks. The necessity of adapting the accelerating effort to the immediate requirements, and of being able on occasion to work close to the limit of adhesion, renders automatic methods of governing the acceleration unsuitable for general locomotive work, and the best practice favours methods in which the accelerating effort is under the immediate control of the driver.

Railway motors being usually designed with sufficient reserve to slip the driving-wheels without detriment to themselves, the weight that it is desirable to allow on the driving-wheels is limited by the strength of the draw-gear of coaches and wagons, which also limits the weight of train and the acceleration permissible with locomotive haul. The couplings used on English goods wagons, consisting of 1½-in. iron chains, probably have an ultimate strength of the order of 60 or 70 tons, and it is not advisable to haul with a locomotive capable of giving a steady pull much in excess of, say, 15 tons. A locomotive having a weight on the driving-wheels of the order of 70 tons, capable of exerting an adhesive tractive effort in service of 17½ tons or more, is accordingly about as heavy as it is advisable to employ at the head of a train in England. As the permissible weight per axle is generally at least 18 tons, the English locomotive needs no more than four driving axles.

The electric locomotive, on account of its large haulage capacity as compared with its weight, shows to great advantage where opposing gradients are long and steep; the economies resulting from this consideration have, in fact, in a number of cases, proved the determining factor influencing the decision to electrify a main-line division. Where such conditions prevail, the use of the locomotive motors, acting regeneratively to restrict the speed of trains descending gradients and return a portion of their gravitational energy to the line for use in operating other trains, becomes feasible and attractive.

Electric locomotives admit of a primary division into two groups, namely, those in which the driving axles are actuated each by a separate motor, and those in which these axles are grouped and driven collectively, through the medium of side rods, by one or more motors. With a few exceptions these two groups correspond with the continuous-current and the alternating-current systems of operation respectively, and have their origin primarily in limitations of motor design. The continuous-current series motor in the rugged form needed for satisfactory locomotive driving is capable of developing large power in a confined space, and there is no appreciable sacrifice of economy or increase of maintenance cost arising from the use of motors of such size as is required to supply the power of a single axle. The single-phase commutator motor, however, is of necessity close to the limits of satisfactory design in many respects, due primarily to the difficulty of obtaining sufficiently good commutation under the conditions of service; and the imposition of space restrictions is felt as a serious obstacle to the attainment of satisfactory operation; the motive power is therefore preferably collected in large units located where restrictions are least onerous and continuous supervision is possible. These considerations, rather than the intrinsic merits of the side-rod design, explain the assiduous efforts that have been made to develop a satisfactory side-rod locomotive. Space restrictions also hamper the polyphase motor, though to a smaller extent than the single-phase commutator motor.

The commonest method for driving locomotive axles independently is through single reduction gearing, the motor being suspended horizontally between axle and transom, and the gearing being entirely at one end of the motor. The unsymmetrical drive has a tendency to wear the pinion-end bearing linings, and thus to throw the armature shaft slightly out of parallelism with the axle, and to increase the stresses at the motor end of the teeth. The gear face is usually 5 in. to 5½ in. wide, and increase in width beyond this does not increase the strength of the teeth in like proportion. It has, accordingly, become the practice, where powerful motors are used, to transmit the power through twin gears, which make better use of the material of the teeth.

Gearred motors mounted above the axles and driving them

The Russian Electricity Tax.—Respecting the contemplated taxation of electrical current in Russia, it is stated in the *Novoye Vremya* that according to preliminary calculations of the Ministry of Finance, this particular tax is expected to yield about 17,500,000 roubles per annum.

through quills are used on many American locomotives. Quill-driving fulfils a double purpose with regard to single-phase motors; it allows them to be supported elastically, and it helps to cushion the impulsive stresses of the driving forces which fall to zero or reverse twice in each period.

Another method extensively used for independent driving employs gearless motors having their armatures mounted concentrically with the axles. In the Grand Central Terminal locomotives of the New York Central and Hudson River Railroad the armature is built on the axle, and the field structure on the locomotive frame, the motor being bipolar, and so constructed that exact adjustment between armature and field in a vertical direction is unnecessary. The inelastically-supported weight on the driving axles in the case of the later types is less than 3 tons per axle, and is carried on 36-in. wheels. The gearless method of independent driving is particularly applicable to high-speed service, for which motors can readily be designed to make effective use of the material of construction.

In both geared and gearless types of independent drive, therefore, unless the expensive expedient of driving through a spring-supported quill is adopted, a certain amount of inelastically-carried weight is added to that of the wheels and axle. The determination of this in the case of gearless drives presents no difficulty, but the geared motor, in spite of its long standing, appears hitherto to have been wrongly treated.

Side-rod driving presents a much more difficult mechanical problem in the electrical locomotive than in the steam locomotive. In the electric side-rod locomotive the original drive is in the form of a uniform torque, and this cannot be converted to reciprocating drive without the introduction of large couplers having transverse arms. The forces tending to produce distortion in the structure are accordingly considerable, but the permissible distortion, together with any inaccuracy of fitting, must nevertheless be no more than can be provided in the clearances between running surfaces. Careful design is therefore needed, and close adjustment of parts is necessary to avoid binding stresses; constant attention is, moreover,

needed for gears and auxiliary shafts. Generally, however, destructive vibration has been characteristic of all single-phase side-rod locomotives employing commutator motors, and the combination of the periodic torque of constant frequency with the periodic change in the incidence of the driving forces of frequency depending on the speed appears to offer an adequate explanation of the phenomena observed; it is probable that single-phase rectifier locomotives driving through side-rods would exhibit similar characteristics, though to a smaller extent, since the application of power is somewhat impulsive in this case also.

Vibration under the control of the suspension springs may arise from want of balance in the rotating and reciprocating parts; since, however, all driving parts of an electric loco-

FIG. 2.

FIG. 1.

required to maintain the locomotive in satisfactory running order, to prevent knocking and the setting up of destructive vibrations.

Whilst locomotives driven by continuous torque are not likely to give trouble from fundamental causes, those driven by impulsive torque are apt at certain speeds to be set in resonant vibration by forces comparable in magnitude with the main driving forces, and it is doubtless to this that must be attributed the fracture of connecting-rods and shearing of crank-pins which has characterised this type of locomotive.

Even in locomotives driven by uniform torque there is possibility of resonant vibrations at certain speeds, due to higher harmonic components of driving force, and since these depend on the clearances and adjustments, the vibration may be more marked at some times than at others. In locomotives driven by impulsive torque, moreover, in addition to the possibility of resonant vibration arising from the fundamental forces, there is probability of such vibration being set up by some of the lower harmonic components of the driving force, and these are likely to be more violent than those set up in locomotives driven by continuous torque, which arise from higher harmonics. This is in accordance with experience; continuous-current and polyphase side-rod locomotives are apt to vibrate slightly at certain speeds, but single-phase side-rod locomotives vibrate much more violently and frequently. The Scotch yoke form of side-rod drive has long been in successful use on the three-phase lines of the Italian State Railways, 130 locomotives of the Givoli goods type alone having already been supplied. The use of the Scotch yoke form on the single-phase Löttschberg railway resulted in vibrations sufficient to fracture the yoke; in this case the trouble was mitigated, and the locomotives were rendered workable by transmitting the power of the motors through springs inserted between the

locomotive move in circles, dynamical balance is generally practicable.

The running of the locomotive on tilted rails and coned wheels causes it to progress with sinuous motion, and although the amplitude of this motion is restricted by the amount of flange clearance, its stability or instability has considerable influence on the performance of the locomotive, particularly with reference to the nosing tendency and the destructive track stresses resulting therefrom.

Factors making for stability are the haulage of a train, the elastic centring of guiding trucks, and to a smaller extent frictional resistances to the oscillation; the inertia of the structure, on the other hand, makes for instability.

In a locomotive fitted with guiding trucks centred by forces proportional to the transverse displacement, the motion is initially stable even when running without a train, and it is the task of the designer to render it stable within the whole range of operating speed and all conditions of operation.

The sinuous motion of the wheels also tends to set up a rolling oscillation of the locomotive, and when the speed is such that the period of this oscillation agrees with the natural period of rolling under the control of the suspension springs, violent swaying is likely to be experienced.

The subject of tractive resistance has received considerable attention in connection with steam trains, but few results derived from tests on electric trains are yet available. Of such tests, however, by far the most important and numerous were made by the General Electric Company in 1905 and 1906 on the Mohawk Division of the New York Central and Hudson River Railroad. Results of these tests have already been published in the usual form, in which the tractive

FIG. 3.

resistance per ton of train is expressed in the form of a curve as a function of the speed, the curves for different lengths of train being adjusted to fit a certain type of formula. Re-examination of the original records, however, without bias towards a particular form of result, throws an interesting light on the mechanics of tractive resistance, which the authors of the tests in question appear to have overlooked.

The tests were made on trains of passenger coaches of two different varieties, which were not mixed in the tests; all the coaches were loaded with sand to considerably more than their normal passenger capacity. The locomotive weighed 90.7 tons.

The curves of fig. 1 give results of the tests, the ordinate representing the total tractive resistance of the train, including the locomotive, plotted against the number of coaches as abscissa for different constant speeds. It will be seen from these figures that each curve becomes substantially a straight line at its upper end, or that, after the first two or three coaches, the additional tractive resistance per additional coach at any speed becomes constant.

In fig. 2 the additional tractive resistance per additional coach is expressed as a function of the speed, and discloses the notable result that for both types of coach the increment of tractive resistance in question is substantially a straight-line function of the speed within the range of speed covered by the tests. This result was hardly to be expected, and other types of coach may well be found to show sensible deviation from a straight-line curve. However this may be, the curve of increment of tractive resistance per additional coach affords valuable data which might with advantage be determined for the principal types of coach in use on a railway.

The tractive resistance of the locomotive apart from the train is not really of much importance, since the condition is not a service one. It is apparent, however, from fig. 1, that the train has a steadying effect on the running of the locomotive, particularly at low speed; in fact, in some cases the total tractive resistance of the locomotive and one coach is seen to be actually less than that of the locomotive alone. If the straight-line portion of a tractive-resistance curve of fig. 1 be extended backwards, as shown in broken lines, to the line of no coaches, the resistance thus indicated may be regarded as the effective resistance of the locomotive, and this is really more valuable than the results of direct test on the locomotive running alone, since it corresponds with service conditions.

Fig. 3 gives the effective locomotive resistance derived from fig. 1, and the resistance obtained by direct test of the locomotive running without a train.

The curves of effective tractive resistance of locomotive and additional tractive resistance per coach furnish the means of determining the tractive resistance of any train composed of the given locomotive and coaches, and the confidence that may legitimately be felt in such determination is of a higher order than can be derived from the data usually employed in this connection.

NEW PATENTS APPLIED FOR, 1916.

An Exhibition in Spain.—The world-war notwithstanding, it is intended in Spain to hold an international exhibition of Spanish electrical and general industries. At a conference held on December 30th, the plans were discussed; the cost of the exhibition was stated to be estimated at 40 millions of pesetas and the receipts at 45 millions. A "Festival of the Spanish Race" will be a feature of the exhibition, and it is expected that the Presidents of the Spanish South American States will assist King Alfonso at the opening ceremony.

Factory Property in 1915.—MESSRS. LEOPOLD FARMER & SONS in their report on factory and commercial property sales in 1915, state that in their experience the sales and letting of factory property, wharves, land, &c., showed far better results than was the case in 1914. "This result is in a large measure due to the war, which has produced a great demand for factories and commercial property of all descriptions. As we anticipated in the early stages of the conflict a demand was created for factories, due primarily to the requirements of the Government for the manufacture of the necessary war equipment for our Fighting Forces, and, secondly, for the manufacture in this country of goods previously imported. . . . The nation's immediate wants have necessarily demanded extra pressure of manufacture which created a necessity for the opening up of factories, as well as the extension of present ones, to cope with the enormous requirements of the country. We have disposed of a large number of factories, with and without plant and machinery, at figures running into many thousands of pounds, and an unprecedented demand still exists for properties of all kinds. Premises that previously to the war had failed to find tenants for years have been rapidly taken up, owners in many cases having obtained, through competition, increased prices. It is interesting to record on analysing the demand for factories that many have been disposed of to the Government, Government contractors in all branches of manufacture, English firms starting to manufacture goods previously imported (now barred through the war), and Belgian manufacturers who largely exported goods to this country, but are prevented from doing so now owing to their works having been destroyed by the Germans."

Ball-Bearings on Railway Rolling Stock.—In 1910 experiments were made on the Montreux-Oberland electric railway with the use of ball-bearings on the rolling stock, and the results were so successful that now all new passenger motor-coaches and trailers and a proportion of the goods wagons are fitted with them. Their use has not been confined to the axles, as they have been found excellent for the bogie slides, easing the motion round curves. The latest step is to fit ball-bearings on the electric motors which are of 114 H.P. each and run at 1,660 R.P.M. at 45 km (28 miles) per hour, and the result has been entirely satisfactory. Experiments with dynamometers showed that with ordinary bearings the tractive resistance was 5.3 kg. per ton, and with ball-bearings 2.3 kg. per ton; the latter require lubrication only once in six months in place of every 10 or 15 days, and last for 10 to 15 years instead of about two years.

NOTICE.

IN view of the recent increase in the Postal Charges, our Subscription Rates for Great Britain and Canada will until further notice be increased to £1 1s. 8d. and £1 3s. 10d. respectively.

THE introduction of the Trading with the Enemy (Amendment) (No. 2) Bill has once more brought into prominence certain vexed questions as to companies which consist in the main of enemy shareholders. The Government has been accused of delaying action in connection with the matter, and it has been stated that the early Acts ought to have more drastically dealt with the situation. The subject, however, is hedged about with difficulties of no ordinary kind, and in some respects those difficulties have been less understood by the legislative mind than by the mind of business men, who have been "up against" enemy-owned firms and companies ever since the outbreak of war. The legislative mind has viewed the matter perhaps too coldly and unsuspectingly, regarding it purely in its legal aspects; the business man, on the other hand, has been in some cases too ready to jump at conclusions, so obnoxious has it been to him to have relations with those who belonged to a race with so vile a record as Germany has written in blood and lust during these eighteen months. We can conceive, however, of circumstances under which the business of a company may well be advantageous to this country, although the majority of its shares are held in Germany and Austria, and it would not therefore be wise to say that a company must be wound up merely because some of its shareholders are Germans; but there is no reason for permitting concerns which are practically entirely German-owned to "carry on," making profits during the war, and keeping the way open for the enemy's "after-the-war trade."

It is most desirable that the matter be taken in hand, and the new Bill will be welcomed by everybody who has observed the extent to which German ownership and control have spread amongst us, notwithstanding the fact that our own Patents legislation has been responsible for much German capital being put into British factories. The principle of the Patents Act was not to enable the foreigner to get a firmer grip here, but to assist the development of British industries within these islands, and when the principle of "limited liability" was established some 60 years ago, it was never intended to enure for the benefit of countries which are at war with England.

The fact that a company is what lawyers call a "separate entity," as apart from the shareholders, should not be allowed to stand in the way if exigency demands that its operations be restricted. Under the law, as it now stands, the dividends on shares held in English companies by alien enemies may be paid to the custodian of enemy profits; but the company may still carry on in war time. The goodwill, which may belong almost entirely to alien enemies, is thus maintained, and war profits might even accrue. The profits thus accumulating might be of great use to the enemy at the end of the war. In particular, the existing law as to ownership of a ship is playing right into enemy hands. No alien can own a British ship, but two Germans can form a company, and that company can own a ship.

The Bill introduced by the Solicitor-General proposes to redress these evils. The Board of Trade is empowered to make inquiries. If satisfied that a business carried on in the United Kingdom is, by reason of enemy nationality or enemy association of those who carry it on, conducted wholly or mainly for the benefit of subjects of enemy states, then the Board may make an order either prohibiting the carrying on of the business during the war, or directing it to be wound up. If the business is for the national benefit, the Board of Trade may allow it to be carried on. If it

is small and insignificant, or if its closure would involve unnecessary hardship, the Board will still be able to exercise its discretion. It will be observed that almost everything depends upon the pursuance of an energetic and thorough policy by the Board of Trade. When once this Bill becomes an Act the Board will have all the powers that it will need to deal with the matter, and we may be sure that if those powers are not put into force, not only the business world at home, but our Colonial statesmen who have worked so hard to eliminate German influence, will want to know why. In distributing the assets of a company which is to be wound up, preference will be given to British and friendly creditors over those who are enemy creditors. If the company has assets in the enemy country, regard will be had to the fact that those assets will probably be applied for the benefit of creditors in that country.

In accordance with the best traditions of English justice the powers given to the Board of Trade err on the side of leniency to the alien enemy. In a winding up the sum due to an enemy shareholder will not, of course, be paid over to him, but will be held until peace is declared, and until it is found how British property in enemy countries is being dealt with.

That it will be necessary to establish such a fund was made plain by Mr. Cave, when he told the House of an Englishman who, when war was declared, was carrying on business in the Fatherland. His business was placed under a controller, he himself was interned. In January, 1915, he was informed that he had nothing further to do with it, that it had become a German business; but that he, as manager, would still be responsible for its debts! But the most unkindest cut of all was that all the profits would be invested in the German War Loan! If this represents the way in which Germany is dealing with English property, it seems to us that the Government would be fully justified in confiscating all German property now in England. But that is not our way, though we may not find it impossible to have a progressive policy in this as in other connections, as the war takes on new phases. Under this new Bill the Government are going to hold on to German property until some time after the end of the war. It will be held in bond as security for fair dealing with property now owned by Englishmen on enemy soil.

The Bill was received with acclamation by the House of Commons, and that is not surprising, for enough has happened in the war to show that Germany is determined to show no mercy to England or to anything English; and the Government should do everything within their power, either through the medium of this Bill or in any other way, to enable us to carry on as far as possible without German companies, German shareholders, or German goods, when peace is once more restored. Acts such as this may go part way in assisting us to that end, but as we have repeatedly shown, there are many other respects in which we have got to set our house in order before Germany will be a permanently beaten commercial and industrial nation. We must not expect too much from Acts of Parliament—merit still counts and always will, and we must improve both the individual and the combined efficiency throughout the nation if we wish to hold our own, or to regain such part of it as we had lost.

Electric Railways.

QUITE unexpectedly—for our thoughts for long have been directed elsewhere—a flood of information on the subject of heavy electric traction and electric locomotives has been let loose upon us, by Mr. H. M. Hobart and Mr. F. W. Carter respectively. Elsewhere in this issue we review the contents of Mr. Hobart's masterly lecture, which conclusively demonstrates that the steam locomotive, having reached its physical limits, has been beaten almost to a standstill by its younger rival. "Youth will be served," in the future as in the past; the steam locomotive for just over a century has done magnificent work, of incalculable benefit to mankind—it has deserved well at our hands, and will continue to do so for many years to come. But its best days are over, and,

even in this country, where coal is abundant and water-power scarce, the inherent advantages of its electrical rival have compelled recognition, whilst in countries blessed with water-power and peace, the electrification of steam railways is rapidly advancing.

Mr. Hobart's lecture was devoted mainly to the marshalling of facts and the deductions that could be based upon them, leading up to the triumphant conclusion that electrification on an extended scale was imminent, preferably on the high-pressure direct-current system; Mr. Carter's paper, on the other hand, dealt with the design and performance of the numerous types of locomotives which have been evolved in the endeavour to find a satisfactory method of transmitting the power from the motors to the driving wheels. It is a curious fact, emphasised by Mr. Aspinall in the discussion, and later by Dr. Parshall, that the outstanding problem in the design of electric locomotives is a purely mechanical one, that of communicating the rotary motion of the motor armature to the revolving wheels—a simple enough matter on the surface, but in reality so complicated by considerations of space, weight, velocity ratio, spring suspension, flexibility of frame, smoothness of running, height of centre of gravity, and other important factors, that it remains up to the present without a satisfactory solution. Mr. Carter has applied the resources of mathematics to certain aspects of the question, particularly in connection with the "nosing" tendency of some types of locomotive, due to the interaction of the coned wheel treads, the flanges, and the rails, and by original methods has succeeded in dissecting the problem into its component parts and providing an apparently sound theory by means of which this objectionable proclivity can be restrained. Two very important facts which he has brought to light, on the basis of exhaustive tests of train resistance that were carried out 10 years ago, are that the tractive resistance of a train of coaches is a straight-line function of the number of coaches, at any given speed; also, the additional tractive resistance per additional coach is a straight-line function of the speed.

In view of the amount of work that has been expended on this subject, and the anomalous results previously obtained, it is extraordinary that these facts—which are now conclusively demonstrated—should have eluded discovery for so long a period, and the author is to be congratulated on the result of his examination of these data.

Both authors are well known to be strenuous upholders of the direct-current system as opposed to single-phase, and they have not failed to indicate the trend of their convictions in their latest writings; Mr. Hobart reminds us that many years ago he predicted the ultimate victory of the high-pressure d.c. system, and Mr. Carter ascribes the evolution of the side-rod "cranky" type of locomotive to the necessities of the single-phase system, which also is credited with resonance tendencies. Naturally, the supporters of s.p. likewise did not fail to repel the aspersions cast upon their *protégé*, which certainly is not yet by any means out of the running. But the controversy nowadays does not assume an acnte form, and the amenities of debate were preserved. No new data regarding the commercial working of the single-phase system were forthcoming, as Col. Crompton regretfully remarked, with reference to Mr. Philip Dawson's contribution to the discussion; but it is interesting to record, as showing that Mr. Dawson preserves an open mind on the subject, that he recently approved of the high-pressure d.c. system as undoubtedly the right thing for a British railway in connection with which he was consulted.

Doubtless there is room for both systems, and both are being extended; but it seems obvious that the successful adoption of continually higher voltages on d.c. systems tends to rob the s.p. system of one of its most tangible advantages. Mr. Aspinall stated that the experimental 3,000-volt d.c. system on the L. & Y. Railway had worked successfully from the commencement.

Mr. Merz considered the United Kingdom particularly favourable to the development of electric traction on railways, and stated that the trial runs on the North-Eastern mineral line had proved highly satisfactory. It is generally agreed that for moderate speeds the existing designs of electric locomotive serve very well, but for express passenger service a satisfactory design is still awaited.

Those Consuls Again.

THE shortcomings of our Consular service, from the trade point of view, are becoming a popular theme—perhaps now we shall see something done. Speaking at a meeting of the Commercial Committee of the House of Commons, of which he is honorary secretary, Mr. Louis Sinclair, in an address to the Employers' Parliamentary Association, referred to those shortcomings, and said that more money should be spent upon the Consular trade service. Some of us have been saying such things almost as long as we can remember. If the Commercial Committee of the House of Commons is worth its salt it will use its influence to secure that result. Particularly interesting are the remarks of the Earl of Rosebery on the same question and on another matter too. In an address to the Rotary Club, Edinburgh, last week, he said that it would be a mistake for business men to seek, or to reckon upon, any assistance from the Government for commercial enterprises after the war. There were, however, two points on which they should be prepared to disregard preconceived notions. They would have to reconsider the question of tariffs, and many of our previous formulas by which we could not be hampered in the prosecution of a successful foreign trade. This remark, be it noted, comes from one who, under other conditions, said that nationally we must stand or fall by Free Trade. The altered situation brought about by the war has put many people's views into the melting pot, but his lordship's attitude forms one of the most conspicuous examples of the willingness of eminent men to scrap their "preconceived notions." Lord Rosebery's second point was stated thus:—"The Foreign Office have always had the greatest antipathy to their Consular agents engaging in promoting commerce of particular firms in foreign countries. I think the *laissez aller* policy will have to be abandoned, and we shall have to sanction the interference of our Consular agents to promote our commerce in foreign countries." With all due deference to his lordship, we would say that it seems to us that in the reform of our Consular service for the good of commercial enterprises, business men have every reason to reckon upon receiving assistance from the Government.

In our opinion, the Foreign Office is far more to blame than any other department for our national shortcomings in this connection. As matters stand, with a few notable exceptions, we receive far greater assistance from our few Trade Commissioners than from all the Consuls, and we should like to see the Board of Trade's activities extended. The Board never really has had an opportunity of showing, on a proper scale, what it can do in legitimate ways through the medium of such representatives. "*Sanction interference*" indeed! Yet we are inclined to think that Lord Rosebery is one of those who really ought to know. Was he not Foreign Secretary once—and for a brief spell Prime Minister too?

"Promoting the commerce of particular firms" it might be right to object to under some circumstances, but a Teuton would have no scruples on that point, so long as the business went to Germany as the result of his Consular activity. But what about the commerce of our nation as a whole? Has the Foreign Office an "antipathy" to the fostering of that? We are very much afraid that that is how it has been too frequently in the past. Yet there is ground for hoping that even the Foreign Office is now willing to do something to assist British traders. We are grateful for its decision to appoint commercial attachés at Buenos Aires, Monte Video, and Rio de Janeiro, a consul and a vice-consul being called from other duties to fill these new offices. The appointments have been made, says the announcement, in consequence of the Secretary of State for Foreign Affairs "having decided to give further assistance towards the promotion of British trade in South America." If this is a sign of the times, we are profoundly thankful for it.

Those who are doubtful as to whether Government Departments are able to assist in the development of national trades might do worse than read the report which we give on another page concerning the first year's work of the U.S. Bureau of Foreign and Domestic Commerce. It tells, it is true, of some of the difficulties that America is "up against" in connection with export trade, but it quotes

a number of definite practical results of the Bureau's recent efforts. The reference to the vote of \$100,000 for new commercial attaché service, and the need for extending such vote and service, should be noted.

Copper.

COPPER prices continue to advance steadily, and it is generally believed in the trade that the recent official pronouncement regarding maximum prices is not to be taken seriously. At any rate, consumers report that they are unable to obtain supplies from the Government at the price fixed by them of £100 for refined material, and after waiting in vain in an attempt to secure relief from this direction have been forced into the market, where competitive buying has naturally forced rates still higher. At the present time it is exceedingly difficult to obtain copper at any price, for the leading producers are sold out for months ahead, and are only willing to make prices for very small lots for prompt or early shipment, while holding off altogether in respect of important distant business. On the top of this, stocks here are going down, and refiners are treating metal which they have discarded for years past, for the simple reason that they are unable to obtain anything else. The enormous margin, too, between the prices of standard copper and refined makes it possible for them to treat the former at a profit, whereas for a long period they have been unable to handle this class of material, and to make a living out of it. The American position shows not the least sign of abating in its strength, and reports to hand from America speak of a copper "famine." Certainly the leading selling agents in America are unanimous in declaring that this condition of affairs has now come to pass, there being hardly any January, February, March or April copper now to be obtained except as a favour. There seems some truth, too, in the statement which emanates from leading producers that there is not sufficient copper to go round, and certainly consumers in need of supplies have been paying enormous prices. Refinery capacity, although going to the fullest extent, is unable to turn out the quantities of material required by the trade, while there seems to be a glut of raw copper, for the mines and furnaces are turning out more material than the refineries can handle. How long this state of affairs can continue is a matter of conjecture, but there can certainly be no relief until war conditions are modified, and we seem likely, therefore, to drift on for months before any definite lead is given. According to statistics just available, the United States output of refined copper from native and imported raw material broke all records—at 735,000 tons, against 684,000 tons in 1914.

British Electrical Exports and Imports during 1915.

ELSEWHERE in this issue we publish a graphic summary of British electrical export and import business during the year 1915, which will be of considerable interest to our readers in view of the exceedingly difficult period through which this country, in common with others, has been passing.

Black as has been the outlook, from the point of view of British trade during the year, it cannot be said that the clouds show any real signs of rolling away, and our consolation, such as it is, must be gathered from the excellent fight which the home electrical manufacturer has been able to put up with a view to retaining overseas trade, despite our concentration on munition making and war supplies.

Although the total value of our electrical exports was naturally much less than during the last few years, it must be remembered that 1915 was devoid of bulk submarine telegraphic exports.

America has usurped the place of Germany as an importer into this country, as was expected, under the conditions prevailing, and the only blot in the import returns for the year, appears to be the fact that it should have been necessary for us to purchase £125,000 worth of lamps and parts from Holland, material which is produced by female labour, and could, therefore, have been produced here, had the manufacturing facilities existed.

MUNICIPAL ELECTRICITY SUPPLY AT JOHANNESBURG.

By R. TURNBULL MAWDESLEY.

(Continued from page 91.)

THERE are four Peebles-La Cour motor-converters installed in the principal generating station, two of 750-kw. capacity and two of 1,250 kw. made by Messrs. Bruce Peebles and Co., Edinburgh, all of which are in constant service. As previously explained, any of these converters may be run either on the d.c. lighting load, or "on traction," by means

FIG. 5.—STATION CABLES ENTERING CABLE TUNNEL.

of the triple-pole main change-over switch on the generator panels.

An interesting point is the wide pressure regulation possible on the d.c. ends of these converters which varies from 460 volts for lighting (shunt wound) to 600 volts for

It will appear that these converters may (or may not) be operating in parallel on both the a.c. sides and the d.c. sides—but in either case no trouble whatever arises in operating these machines in parallel, whether the d.c. ends are in parallel or not.

The starting-up of these converters is accomplished by switching the high-tension (3,000-volt) current, direct to the stator winding. On the 750-kw. converters three of the 12-phase windings of the rotor are brought out through slip-rings to a non-inductive metallic resistance, the neutral point of which is earthed, and connected to the middle wire of the d.c. lighting system (and also to the negative (rail) of the traction system). On the 1,250-kw. converters, six windings are brought out from the rotor windings, through slip-rings, also to an external non-inductive resistance, the neutral point of which is earthed, as above. The other ends of these windings are permanently connected to the d.c. armature windings, through the shaft, which is hollow, and supported by a central bearing between the a.c. and d.c. sides of the machine.

The stator currents induce currents in the phase windings of the rotor, and the machine starts up as an ordinary induction motor. When the speed rises to synchronism—which can be observed by the oscillations of the pointer of a voltmeter connected across the starting resistance—this resistance (which is not variable as in three-phase converters) is short-circuited by a switch on the starter.

The converter is now in parallel on the a.c. side, the slip-rings and the open ends of the remaining windings being short-circuited by a lever on the end of the shaft.

During the starting-up period, the d.c. end of the converter is not connected to the d.c. bus-bars at all, the only d.c. circuit closed being that of the shunt field.

Slight variations in speed before synchronising can be made by altering the shunt field resistance—but practice has shown a more or less permanent position for the field regulator—on starting.

Mr. J. W. Saaler, A.M.I.E.E., of Messrs. Sykes & Co.,

FIG. 6.—VIEW IN THE ENGINE ROOM, JOHANNESBURG MUNICIPAL POWER STATION.

traction. This variation is handled solely by a regulating resistance in the shunt field circuit. As previously observed, the power-factor may be leading when on traction load, and is never below .96 on lighting.

Johannesburg, who obtained part of the converter contract, gives the following test figures for one of the 750-kw. converters, in a paper "On Converters," read before the South African Institute of Engineers.

MOTOR-CONVERTERS OF 750-KW. CAPACITY.

Specification.

A.C. end, 3,300 volts—2-phase, 50 periods.
 D.C. end, 460/120 volts as shunt—1,630 amps.
 500/600 volts as compound—1,250 amps.
 Number of poles on A.C. side—8 } speed, 375 revs.
 Number of poles on D.C. side—8 }
 Number of commutating poles—8 }

Efficiency measured as shunt generator for lighting at 520 volts—1,445 amps., 750 kw., D.C. output.

It is assumed that the efficiency is in the neighbourhood of 91 per cent., the input, therefore, on the A.C. end is 825 kw. With this input at 3,300 volts, the current per phase is 125 amps.

	Full load.	Half load.
No-load losses, comprising friction in bearings and commutator, windage losses, all A.C. and D.C. iron losses, measured	29'0	29'0
Resistance of shunt winding 76'5 ohms, hot shunt current about 6'5 amps.... ..	3'2	3'2
No-load losses	32'2	32'2
Resistance of stator winding 0'18 ohm hot per phase—

Resistance of D.C. armature winding, 0'0067 ohm hot—		
Full load 1445/1'5 = 96'5 amps.	6'25	—
Half load 723/1'5 = 482'5 amps.... ..	—	1'56
Resistance of interpole winding hot, 0'00037 ohm—		
Full load, 1,445 amps.	0'77	—
Half load, 723 amps.	—	0'19
Commutator current losses at 1'445 amps., drop two volts, resistance 0'00138	2'88	—
Half load, 723 amps.	—	0'72
Total losses	56'25	38'22

Total losses in per cent.—

Full load $\frac{56'25 \times 100}{800 \cdot 25} = 6'97\%$ Half load $\frac{38'22 \times 100}{413'22} = 9'25\%$

Efficiencies—

At full load = 93'03 %

At half load = 90'75 %

The cable work at the back of the D.C. main board, the roomy cable chamber (fig. 4) beneath the oil switch cubicles, and the system of supporting the machine and feeder cables, are worthy of note.

Fig. 5 shows cables from the station entering the main cable tunnel, about a quarter of a mile long.

FIG. 7.—MOTOR CONVERTERS, JOHANNESBURG POWER STATION.

A comprehensive view of part of the converter plant is shown in fig. 7, the view showing one 750-kw. and one 1,250-kw. Peebles converters.

The three steam turbines at present installed were made by Messrs. Belliss & Morcom, and were supplied through Messrs. Rennett & Lenz, their Johannesburg agents. They are each of the high-pressure re-action type, but two of them are furnished with exhaust steam belts, as shown in

fig. 6. The turbines are not supplied at present with mixed pressure steam, that is to say, the exhaust from the reciprocating Belliss sets is not utilised in the turbines, but passes direct into separate condensers.

The reason for this is not obvious, as, on the peak loads, the Belliss reciprocators carry anything up to 2,000-kw. load, and sometimes more.

Each turbine has its own condenser, of the surface type, having a cooling surface of 7,200 sq. ft. with 3,670 tubes 10'2 in. long. Their intended duty is to condense 46,200 lb. of steam per hour, and to maintain a vacuum within 1'6 in. of the barometer, with circulating water at an initial temperature of 70° F.

The circulating and kinetic air pumps are motor-driven at the following speeds:—Air pump, 1,500 R.P.M., and circulating pump,* 600 R.P.M. Each turbine has a cooling tower to deal with its condenser circulating water, the towers being erected directly over their individual cold wells. As these wells are at different levels, the necessary by-pass pipes and valves are fitted to maintain the water levels in the wells, or dams. The circulating pumps are situated outside the station proper, and have both A.C. and D.C. drives. It will be understood that the problem of circulating water in Johannesburg has presented some difficulties, as the town is situated in an extremely dry area, and all cooling ponds are artificial. Make-up water, for circulating purposes, comes from bore-holes sunk in the immediate vicinity, or, as stand-by, from the Rand Water Board, but in the rainy season there is no need for make up.

The turbo-generators call for little comment. Each supplies current at 3,000 volts, 50 ~ two-phase; and each has a direct connected exciter on the generator shaft.

There is at present no arrangement for operating the exciters in parallel, each machine and exciter comprising a unit.

The Belliss reciprocators shown in the background of fig. 6 are of the standard triple-expansion type, each direct connected to a continuous-current generator. These four engines exhaust directly into two condensers situated between the sets, the condensers operating individually, or in multiple as may be required.

As the switchboard gallery is placed at one end of the station, two operator's signalling devices have been installed, one for the turbines and one for the reciprocators.

Each is operated from the switchboard gallery, the various signals being shown on illuminated boards, attention to which is drawn by trembling bells.

A point not without interest is the fact that no shift engineers are employed in the Johannesburg Municipal Power Station. The responsibility of operating the station is vested in a shift electrician, who is virtually, though not nominally, in charge. All switching operations are carried out by the shift electrician, who by signal advises the drivers concerned if more machines are required. The drivers and boilermen are each made responsible for their own part of the work—and although at first sight such an arrangement would seem to point to trouble arising, such has not occurred. It is well to add that the station engineer resides on the property, and is always within call.

The 1,000-kw. alternator, coupled to a Belliss reciprocator, together with the two 250-kw. Allen engines, are erected in a separate engine room, adjoining the present boiler-house—which building originally housed the first belt-

driven bi-polar generators, before the gas engine period. This 1,000-kw. Belliss set and the two small Allen sets are run non-condensing—but this is not a serious item, as their hours of service are strictly curtailed—unless in case of trouble or emergency.

(To be continued.)

* Circulating pump designed for 60 ft. head, including suction and discharge and allowance for pipe friction.

COST ACCOUNTING BY MACHINERY.

A REMARKABLE machine was described in a recent issue of the *American Machinist*, which is intended to replace mental labour in analysing and combining works cost accounts. The installation, which is electrically operated throughout, has been at work since October 1st, 1915. At any moment of a working week it shows how much each man has earned up to that time, the total wages accrued in each depart-

supplies. Thus far only four departments are being served.

The equipment comprises a cabinet in which the pay-roll accounts are registered, two cabinets for job accounts, and the job-distributing switchboard. A standard type of programme clock is also provided. Only a single operator is necessary.

In a diagrammatic form the operation of the recording mechanism is shown in fig. 1. The source

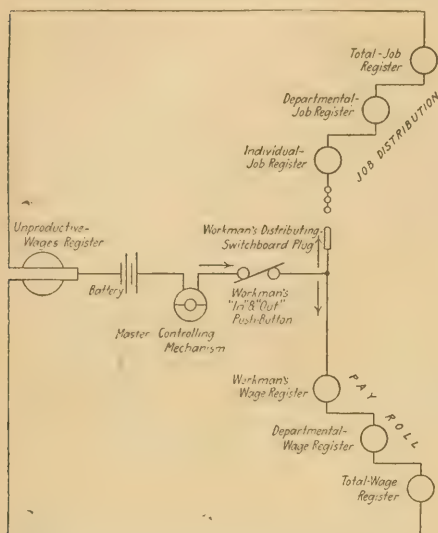

FIG. 1.—DIAGRAM OF OPERATION OF REGISTERS.

ment, and the grand total of wages in all departments. It also shows during the life of each shop order how much labour has been expended on it, how much labour each department has accumulated since the commencement of the week, and the total

FIG. 3.—JOB LABOUR-DISTRIBUTING REGISTERS.

of electric current is a storage battery which is connected to the circuits through the master controlling machine. The recording circuit through the pay-roll registers is closed by the workman when he pushes in his button on entering the shop in the morning and at noon. On leaving at noon and night he releases his button. When the hour for beginning work arrives, the controlling mechanism begins to send electric impulses through the pay-roll registers, depending in frequency upon the man's rate. These impulses actuate the counters and accumulate his wages, a cent at a time, on one counter, his part of a departmental wage on another, and his part of the total wage of all the departments of the shop on a third.

These registers accumulate for each pay-roll week, which runs from Thursday morning to Wednesday evening. The totals are then transferred to written records and the counters are re-set to zero and replaced, or others already set to zero substituted for them. By these changes the equipment is made ready for the next week's pay-roll accounting.

Turning back to the diagram, it will be noticed that only the lower circuit through the pay-roll registers has been traced. There is another, and as drawn, upper, circuit passing through the job-distributing registers.

When a workman's circuit is plugged into the proper job register through the distributing switchboard, the same impulses that register his wages also register the amount of his labour, first on the individual job counter, second on his departmental job counter, and third on the job-labour counter for all the departments. The record of the individual job register is copied off as soon as the job is finished, the counter is removed, set back to zero, and

FIG. 2.—JOB-DISTRIBUTING SWITCHBOARD.

labour expended in all departments during the same period.

The machine deals with about 60 workmen; about 300 to 350 job changes are made every day, and 500 jobs can be registered at once.

The system is known as the "Chrono Cost-Accounting System," and the equipment was designed by the Synthelytic Co., of Chicago, and installed in the plant of the Liquid Carbonic Co., also of Chicago. The product of this plant is soda-water fountains, bottling machinery and soda-fountain

replaced ready to record another job. The department distribution totals and the grand total are used to check the pay-roll totals, and are erased at the end of each pay-roll week.

This explanation covers all the features of the diagram, fig. 1, except the "unproductive-wage register." Its purpose is to accumulate all the wages by departments that are being recorded on the pay-roll registers, but not on job-distribution registers. It is evident that for any week the sum of the readings of the "total-job register" and "unproductive-wage register" must equal the reading of the "total-wage register."

The workman's push-buttons are in the form of simple push-button switches built up into panels placed near the shop entrance. White buttons register in, and black ones, out. These panels replace the usual time clocks.

The payroll register cabinet has been developed from a measured-service meter that has been used for years in telephone exchanges. The job-distributing switchboard, which also has been adapted from telephone practice, is shown in fig. 2. The plugs when inserted into the jacks connect the source of electric impulses for individual jobs with the job-distributing counters for the jobs on which they are

according to the workman's rate of pay. An impulse is "offered" to every circuit once every minute; whether it is sent on or not depends on the circuit being open or closed, and this is determined by the relationship of the man's rate and any particular minute in question.

The rates are set as regards the mechanism by the rate rack, which provides groups of connections for all even-cent rates from 6 to 60 per hour. The circuit from each man's push-button is through the rack and the particular group of connections corresponding with his rate. An impulse from the machine for a 30c. man finds a closed electric circuit only every other minute.

The information for the completion of the circuit between an individual man's rate-rack connection and the proper job register is received at the distributing switchboard over the private telephone system. When a workman begins or finishes a job he telephones his own number and the job number to the switchboard. From this information the switchboard operator makes or breaks the proper connection. It is evident that this distributing board is constantly undergoing changes in settings as some jobs are completed and others begun.

The master controlling machine is most ingenious in design and interesting in construction. It is driven by a three-phase motor, together with an emergency d.c. motor that will automatically pick up the load of the machine if the alternating current fails.

When the shop goes on time-and-a-half (5 p.m. to 11 p.m.), the controlling machine runs at $1\frac{1}{2}$ times normal speed, and for double time (11 p.m. till morning) at double speed. Provision is made to meet the case of labourers who are paid at lower overtime rates, and for odd fractional rates of payment.

Supervision is arranged for at two places—on the distributing switchboard and in a special lamp panel in the superintendent's office. Under normal working conditions a lamp glows on the superintendent's panel for every man whose wages are being added to the unproductive-wage account. By pressing a button a lamp glows for every man who is registered as in attendance and is drawing wages. Similar signals show on the plug shelf of the switchboard.

Beyond this, each man's circuit is provided with a lamp located near the switchboard plugs. This light at the instant that an impulse is being sent along their associated circuits to the registering mechanism. The purpose behind this feature is to forestall the possibility of plugging a man from one job to another at the precise instant an impulse is being sent over his circuit.

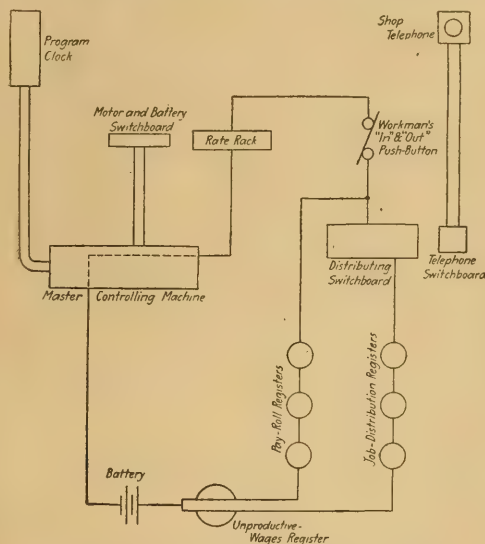

FIG. 4.—ARRANGEMENT OF COMPLETE EQUIPMENT.

working. The counters are shown in fig. 3; five counters are fitted in a frame and form a unit. Each counter records from 1 cent up to \$9999.99 by one-cent increments, and each electric impulse accumulates one cent. On the back of each registering unit is a locking device which prevents any movement of the counter wheels when a strip is removed from the cabinet.

The devices that control and send the electric impulses which actuate the registers consist of a master controlling machine, a programme clock that controls its operation with reference to elapsed time, a switchboard and rheostats that control the driving motors of the machine, a storage battery supplying current for the registering circuits, a rate rack for the workmen's rates of pay, and a private telephone system to convey information with regard to jobs. The machine can be run at normal speed, $1\frac{1}{2}$ times or twice normal. The whole arrangement is diagrammatically shown in fig. 4.

The principle on which the system operates is that of figuratively allotting to each workman a small fraction of his wages at short intervals, the amount being always one cent, and the interval being varied

ELECTRIC RAILWAYS.

THE "James Forrest" lecture, which was prepared for the Institution of Civil Engineers by Mr. H. M. Hobart, M.Inst.C.E., and delivered on his behalf by Mr. J. A. F. Aspinall, is a compendium of information on the subject of electric railways in general, and especially upon recent progress in the United States. So rapid has been the development in this branch of engineering since electric locomotives commenced running on the City and South London Railway in 1890, that there are now 3,460 miles of steam railway track converted to electrical operation in the United States and Canada alone; on the other hand, there remains 380,000 miles of track still operated by steam, so that there is abundant scope for future conversion. The author gives the total mileage of electric railways in the United States and Canada as 45,000 miles, but this clearly includes tramways.

During the last five years the mileage of steam railway converted has more than doubled. The reason given for this rapid growth is the continual

decrease in the cost of electrical energy, which in turn has been accelerated by the railway demand: even ten years ago a price of 1d. per kw.-hour would have been the minimum permitting of any profit, whereas now electrical energy can be purchased at little more than $\frac{1}{4}$ d. per kw.-hour, and on the Butte, Anaconda and Pacific Railway the cost is 0.265d., whilst the Chicago, Milwaukee and St. Paul Railway will pay only 0.26d.; in both these cases the electricity is derived from water-power. The cost of plant has also come down with a run; a 3,000-kw. set 15 years ago cost £30,000, whereas now a 30,000-kw. steam-turbine-driven set can be obtained for less than £60,000, and consumes only $\frac{2}{3}$ as much steam per kw.-hour.

While the fixed charges are lower than the operating costs in the case of a steam-driven station, the reverse holds good for the hydro-electric station, and for load factors above 20 per cent. the total costs of the latter are much the lower, so that, as an electrically-operated railway has a fairly good load factor, the greatest progress has been made with railway electrification in countries possessing abundant water-power. The author sets out the working costs of a 150,000-kw. steam-driven generating station equipped with generating sets of 30,000-kw. each, with a load factor of 50 per cent., and shows that with fuel at 8s. per ton, the total costs amount to 0.265d. per unit, of which fuel accounts for 0.075d. Transmission for a distance of 100 miles adds only

electric locomotives have a maximum tractive effort of 48,000 lb., and a continuous tractive effort of 25,000 lb. at 16.2 m.p.h. corresponding to 1,080 h.p. The net ton-mileage at present carried by the railway is some 170 million ton-miles, the gross ton-mileage, including the locomotives, being 400 million ton-miles per annum. With electric traction the average weight of the ore trains has been increased from 1,600 to about 2,100 tons; two locomotives can haul a train weighing in all 4,300 tons up a grade of 0.3 per cent. at a speed of 16 miles per hour, which is more than twice as fast as the lighter trains (3,600 tons) hauled by the steam locomotives.

The author analyses the performance of the electric locomotives at some length, and shows that the efficiency of the locomotives from pantograph to drawbar is of the order of 80 per cent.; he also compares their performance with that of the steam trains, and finds that the outlay for fuel and power has decreased by 39 per cent. with electrical operation. Owing to the greater speed and the heavier trains hauled by the electric locomotives, the number of trains per day has been reduced by 25 per cent., resulting in a saving of 33 per cent. in the total hours of work of engine crews as well as a reduction of 21 per cent. in trainmen's wages. In the passenger service on the same railway, the delays to trains amounted to only one-fourth as much as with steam haulage. The total net annual saving due to the adoption of electric haulage amounts to £74,000.

FIG. 1.

FIG. 2.

FIG. 3.

CHARACTERISTICS OF 3,000-H.P. ELECTRIC LOCOMOTIVES.

0.08d. per unit to the cost. Whilst an electric locomotive may have a load factor of only 15 per cent., the combined load factor of 30 locomotives may be as high as 60 per cent., thanks to the diversity factor of the system, which in this example is 4.0. But by combining the loads of other consumers with the railway load, a still better load factor can be obtained, and hence a railway rarely generates its own electricity at so low a cost as that at which it can be manufactured by a company giving a general supply.

These principles have been put into practice recently on a scale so large as conclusively to demonstrate their correctness; as an example, the author describes the B.A.P. Railway above-mentioned, a mountain-grade system employing a considerable number of freight locomotives; this system was described in our issues of March 27th and April 3rd, 1914. It comprises 114 miles of single track, and was formerly operated with 27 steam locomotives, consuming 197 lb. coal per locomotive-mile, which coal cost 19s. per ton. The electrification of the system has been nearly completed, and at present the traffic is handled with 17 electric locomotives and four steam locomotives; the former consume 26.3 kw.-hours per locomotive-mile, at 0.265d. per unit, costing 7d. per mile, as compared with 19.9d. per steam locomotive-mile for fuel. The line voltage is 2,400 volts D.C., the motors being wound for 1,200 volts and permanently connected two in series. The elec-

trical locomotives have a maximum tractive effort of 48,000 lb., and a continuous tractive effort of 25,000 lb. at 16.2 m.p.h. corresponding to 1,080 h.p. The net ton-mileage at present carried by the railway is some 170 million ton-miles, the gross ton-mileage, including the locomotives, being 400 million ton-miles per annum. With electric traction the average weight of the ore trains has been increased from 1,600 to about 2,100 tons; two locomotives can haul a train weighing in all 4,300 tons up a grade of 0.3 per cent. at a speed of 16 miles per hour, which is more than twice as fast as the lighter trains (3,600 tons) hauled by the steam locomotives.

Mr. Hobart states that the chief item of expense in electrifying a railway of this character is that for electric locomotives; these are comparatively new types of machine, and cost (gear-driven) from £80 to £90 per ton, whereas steam locomotives are thoroughly standardised, and cost only £30 per ton. Against this must be set the greater weight of the steam locomotives (2:1), and the greater traffic-handling capacity of the electric locomotive, and the author finds that 21 electric locomotives costing £134,000 would be equivalent to 32 steam locomotives, which also would cost £134,000. As the design becomes standardised, the cost of the electric locomotive is certain to decrease.

Electric locomotives cost far less than steam for repairs, this item on the B.A.P. Railway amounting to 2.2d. per locomotive-mile for the former compared with 6.5d. for the latter.

The employment of the 2,400-volt system enabled the two sub-stations on this line to be spaced 26 miles apart; had the pressure been 600 volts, at least six sub-stations would have been necessary, costing more than twice as much and having a lower load factor and lower efficiency, whilst the wages of at-

tendants would have been correspondingly greater. Motor-generators are employed, running at 720 R.P.M., and rated at 1,000 kw. (1,500 kw. for 2 hours). Each synchronous motor drives two 1,200-volt generators connected in series; the latter are compound wound, provided with interpoles, and fitted with distributed compensating windings in the pole shoes. The average sub-station load factor is about 34 per cent., and the average load 2,050 kw. The motors are run with over-excited fields so as to have a leading power-factor, which offsets the lagging power-factor of other customers of the Great Falls Power Co., which supplies the energy to the railway company.

The trolley conductor has a cross-section of 0.166 sq. in., and the cost of the distribution system has amounted to £1,110 per mile of single track, of which one-half represents the cost of erection. The current collected by two locomotives attains a maximum of about 800 amperes, and as it may not divide equally between the two pantograph collectors, a single contact may carry as much as 500 amperes; the trolley wire can carry 1,000 amperes continuously with a rise of temperature of 180° C. in the open air, and as the current comes from both directions along it, the system can deal with four 72-ton locomotives between two adjacent feeding points, requiring an aggregate of some 2,000 amperes. Under normal conditions of running the average current collected per pantograph is only 400 to 500 amperes when starting and ascending grades.

Mr. Hobart next deals with the still more important Chicago, Milwaukee and St. Paul Railway, which is being electrified at 3,000 volts D.C. for a length of 440 miles, comprising 650 miles of single track; eventually it is expected that the electrification will be continued to the Pacific coast, making a total route length of 850 miles. The system was described in our issue of November 5th, 1915. Forty-two electric locomotives, each weighing 250 tons, with equipment for 14 sub-stations, are being supplied, and a length of about 113 miles has just recently been put in electrical operation; energy is purchased from the Montana Power Co., which has 10 hydro-electric plants in this region, having an ultimate aggregate capacity of over 200,000 kw. The electricity will be supplied at a pressure of 100,000 volts, 60 cycles, at 0.26d. per unit. With 3,000 volts on the line, the sub-stations are spaced at an average distance of 32.5 miles apart, but the actual distance varies from 18 to 43 miles. Gradients of 2 per cent., 21 miles long, and 1.66 per cent., 10 miles long, have to be overcome.

The sub-station machinery is similar to that of the B.A.P. Railway, but the sets are of 1,500 and 2,000 kw. continuous rating; the total capacity installed is 59,500 kw.

Each locomotive has a continuous rating of 3,020 H.P., and is thus 40 per cent. more powerful than two B.A.P. locomotives; a noteworthy feature of the former is the equipment for regenerative braking for long periods on down grades. The collector has a double contact device, and can collect 2,000 amperes from a double trolley wire at 60 M.P.H. The line is equipped with the double-wire catenary construction, having two No. 0000 wires both suspended from the same catenary wire, but by independent hangers, the suspenders of one wire being midway between those of the other. The two wires hang close together, and the alternate suspension provides exceedingly smooth operation, with complete elimination of any tendency to flash at the points of suspension. The tractive effort of the locomotive at 15.9 M.P.H. is 71,000 lb. (continuous rating), and is provided by eight motors, each driving one axle; the locomotive can haul a load of 2,250 tons, in addition to its own weight, up a gradient of 1.0 per cent. at 15.9 M.P.H., developing 3,020 H.P., with a pantograph-drawbar efficiency of 80 per cent. As in the case of the B.A.P. Railway, the motors are cooled

by the forced circulation of air from an external blower. The accompanying figures, 1-3, show the characteristics of these locomotives.

The heaviest duty imposed upon the locomotives is drawing a load of 2,230 tons 49 miles up an average gradient of 0.7 per cent., the ruling gradient being 1 per cent.; the speed is 16.5 M.P.H., and the average output of the motors 2,380 H.P. The cost of electrical energy is 43d. per train-mile, compared with 58d. for steam.

Allowing for fuel and power, wages, repairs, and capital charges, the annual outlay per electric locomotive-mile is given as 43.3d., as against 47.5d. for steam traction; but this figure takes no account of the indirect economies recorded due to the heavier trains and higher speeds, which increase the capacity of the railway and reduce wages. Moreover, the C.M. & S.P. Railway locomotives are equipped with regenerative braking, which is estimated to effect an economy of about 25 per cent.; wear on wheels and brake shoes will be decreased, and the speed on down grades may be higher in the absence of heating of

FIG. 4.—CONNECTIONS OF TRANSFORMER, PHASE-SPLITTER, AND MOTOR.

tires. Another advantage of regenerative braking is the fact that the energy thus generated by descending trains is supplied to neighbouring ascending trains, with a greatly reduced loss in transmission, and the capacity of the generating and sub-station plant is virtually increased. The author points out that, though regenerative operation was considered 10 or 15 years ago, it would not then have had the advantages which now accrue, owing to the greater weight of the electrical equipment in those days and the increase in the total weight of the train due to the regenerative feature. In the case of an electric railway handling dense traffic, requiring, say, 100 million kw.-hours per annum, by the adoption of regenerative control the plant necessary might be reduced from 25,000 kw. to 22,500 kw., and this would run through the whole of the system.

Mr. Hobart next deals with the Norfolk and Western 11,000-volt single-phase railway, comprising 29 miles of double track (97 miles of single track). Electrical operation was commenced in May last year with 12 240-ton locomotives, each consisting of two 120-ton units. Trains weighing 2,900 tons, in addition to two 240-ton locomotives, are hauled up gradients averaging 1.13 per cent. and 15 miles long at 14 M.P.H., twice the speed at which three 240-ton steam locomotives took up similar trains. The advantages claimed for this electrification are similar to those already set forth; in this case also regenerative control is employed, and by relieving the congestion at a single-track tunnel 4,000 ft. long, the carrying capacity of the line has been greatly increased. Fig. 4 shows the connections on the locomotive; electricity at 11,000 volts, 25 cycles, is received by a step-down transformer carried on the locomotive, and indicated at A, fig. 4. The pressure

at the secondary terminals of this transformer is 750 volts. Part of the electricity goes direct from the secondary of the transformer to the polyphase motors (indicated diagrammatically as B in fig. 4) which drive the locomotive; the remainder of the electricity passes through the phase-splitter C on its way to the polyphase motors B. By this means the single phase electricity supplied to the locomotive is converted into polyphase electricity, and is thus made suitable for driving the polyphase motors. Each 240-ton locomotive is equipped with eight of these motors.

With a view to economical working, the tendency on American railways for many years has been to keep down the train-mileage and to increase the ton-mileage, involving a continual increase in the power of the locomotives; in 12 years the average tractive power was increased 50 per cent., and the capacity of freight cars 40 per cent. Not only can this policy be most effectively carried on with electric locomotives, but the latter also enable the speed to be doubled.

The author proceeds to describe the "1913" type of electric locomotive in use on the New York Central Railway, which weighs 115 tons and has a continuous rating of 2,000 H.P., with a tractive effort of 13,840 lb. at 54.5 M.P.H., on a 600-volt D.C. third-rail system. The armatures of the motors, which are bipolar and of 250 H.P., are mounted directly on the axles. These locomotives haul at 60 M.P.H. trains having a total weight of 1,100 tons, and have an efficiency from collecting shoe to drawbar of nearly 80 per cent.

In 1915 the total single-track mileage of electric railways in the United States operated on the single-phase system was 1,490 miles, while that using high-pressure direct current was 3,720 miles; while the adoption of the single-phase system has by no means come to a standstill, the author holds that the superiority of the high-pressure D.C. system ensures its general use on main-line railways in preference to the single-phase system, and points out that nearly nine years ago he foretold this outcome. He draws attention to the defects of the rectified single-phase current which has been adopted on some lines, and to the necessity of installing frequency-changers to obtain 25-cycle single-phase current from 60-cycle supply, thus doing away with the advantages of static sub-stations, while the efficiency of the system is inherently lower than that of the D.C. system.

The cost of supply, analysed at considerable length, is found to be about the same at the locomotive, no matter whether the high-pressure D.C. system or the single-phase 25-cycle system be employed, while a 60-cycle supply converted to 25-cycle single-phase costs rather more; but the cost of the single-phase locomotives is inherently greater than that of the D.C. machine.

Mr. Hobart concludes that the extensive conversion of steam railways is in prospect in the near future; that the D.C. system is the most appropriate; and that high pressure D.C. locomotives are an established success.

COMMERCIAL MOBILISATION.

ON Thursday last week, at the Connaught Rooms, the BRITISH ELECTRICAL AND ALLIED MANUFACTURERS' ASSOCIATION held the fourth of its series of trade conferences, this one being devoted to the consideration of the steps that ought to be taken towards organising industry in readiness for the commercial campaign that will follow the war. The audience numbered about 120, and included many prominent representatives of industry, shipping, and finance. Mr. F. R. DAVENPORT, chairman of the Council, presided.

The discussion was opened by Mr. HENRY THORNTON, general manager of the Great Eastern Railway, with a short address which was accorded a very hearty reception. Mr. Thornton regarded it as a sign of very healthy optimism that England was discussing what was to be done with Germany when Germany was "down and out"; he shared the conviction

that we would shortly make rapid progress on land and sea, and commended British manufacturers for looking ahead.

The new conditions would be strange and uncertain, and there would be tremendous changes, but England's trade would continue to progress; no doubt there would be some difficulty in finding capital, but the British Empire, which had never yet defaulted, possessed unassailable credit, an immense mercantile marine, vast Colonies with unlimited natural resources, and a population skilled in manufacturing and of indomitable pluck—with such assets at command, the Empire could never be insolvent.

The time for taking was over—the time was now ripe for action. The problem was how to set about the capture of foreign markets. In the United States it was recognised that very large resources were necessary for such a purpose, and that the capital could only be obtained by arousing the interest and co-operation of the entire nation; thorough organisation, machinery for the investigation of foreign markets, competent men at the head, were indispensable requirements. Accordingly, a Corporation had been formed, with a capital of ten millions sterling, for the purpose of engaging in any kind of business, and was controlled by representatives of big companies in every branch of commercial activity. But the conditions in this country were different, and he did not recommend the adoption of the American plan. At present the British had no one scheme backed by powerful influence and sufficiently comprehensive to contemplate a successful attack on foreign markets; there was, in fact, a danger that the movement might dissipate itself in a number of small and separate efforts. Amongst the essential factors of success were the assistance of the banks, the aid of linguists, the combined support of the various transport agencies, the help of the Government in every possible way, and the assistance of the Press. The Government backing in particular must be effective. As the first tangible, constructive step towards the goal, he advocated the formation of a committee of experienced business men, on which all interests should be represented, with a specially competent man at the head—a Lord Derby for commercial affairs. Let them enlist the banking interests, and send agents into the foreign markets with the weight of the whole country behind them.

Mr. C. H. MEAZ emphasised the importance of making a beginning on the right lines. An organisation such as Mr. Thornton had outlined might be taken to be partly in existence already. After the war, electrical manufacturers would have to go still further on the lines this association was formed to promote. Hitherto the efforts of British manufacturers had suffered from want of cohesion and organisation: when one required plant, etc., it was embarrassing to find that so many people all wanted to quote for the same thing. This country did not take kindly to anything in the nature of a "trust," but the Association would strengthen its position if it could agree that a certain number of manufacturers should manufacture certain articles—why should so many want to make everything? Economical production with small output was not possible, and competition had gone beyond the point up to which it was of advantage to the purchaser.

The first essential to success in establishing a given export trade was prosperity in that industry at home, which would secure to it financial support, as in the case of the textile industry. The electrical industry had suffered from the socialistic experiments of Parliament, with the result that financial aid was not attracted, experience was not gained, men were not trained. The Association should insist on being given the opportunity of acquiring experience at home; there was plenty of scope for it, in connection with our big industries. Unless they could train the men at home, they could not successfully carry on trade abroad; the men sent overseas must know their work, and the goods must be of the right quality.

Mr. H. GORDON SELPRIDGE said that after this war the business men of this country would have to take up the struggle, and should prepare for the task with the help of the best intelligence available to them. England had grown so rich that the commercial fight was hardly so attractive as in olden times, but there was plenty of sport in commercial warfare; there was also a duty laid upon the shoulders of the business men, who were the wage earners of the nation, and on their efforts would depend the rejuvenation of the national finances. This country was well able to stand the strain; it should now again seize and hold the position of the world's chief manufacturing, money-making, and producing country. The Government was made up of lawyers, who occupied too big a place in most governments, and it was useless to expect support from it—they must rely upon themselves; the business men should form their own committee and carry on without reference to the lawyers. Inertia must be over-ruled—those who were aggressive must ignore those who were sluggish, and press on as in the days following the Napoleonic wars, when Britain covered the world's requirements. All depended upon the spirit, enthusiasm, and imagination of the business men; never was there such a wonderful opportunity for a nation to make itself supreme, and to make the commerce of this country a most interesting career. Londoners could hardly realise what the name of London meant to the rest of the world; the prestige and respect attached to it made it a world asset. This was the first body he had heard of which had sought to form a great combination that would set the pace for the rest of the nation; he approved of the idea of forming a vigorous committee, and declared that with the united efforts

of enthusiastic business men this country could do anything else.

Mr. COLTON declared that they must fight the Germans to a standstill; the enemy had developed a great commercial machine, with the aid of money obtained from British banks—what would they do for capital in the future? Already they were considering means for strengthening their strong organisation and overcoming the prejudice which had been created against their wares.

Mr. S. Z. DE FERRANTI expressed the pleasure he felt at seeing the B.E.A.M.A. acting on the right lines to bring about success. The first thing to be done to promote trade after the war was to make sure of our own home market. It would be better for the country if British manufacturers consisted of a moderate number of very rich and prosperous concerns instead of many small and poor ones. The electrical industry had suffered under conditions of the most severe competition and legislative restrictions in the past; adversity brought out one's good qualities, but might be carried too far. In order to go ahead and secure command of the world's trade we must have plenty of money for development work. From a technical point of view, to arrive at the most perfect product required a steady flow of money and continuous progress; the development of the world's markets also required that plenty of money should be available. For these two reasons prosperity in the home markets was essential. After the war they must not work under excessive handicaps; they must be strong and have ample funds at command. America and Germany protected their home markets, and upon success at home Germany built up her foreign successes. Municipal enthusiasts here used electricity as their plying for socialist experiments, and the politicians killed what otherwise might have been another textile industry in point of national importance. The textile industry grew to huge proportions unhindered, whereas Parliament cramped the electrical industry, as it had also strangled the automobile industry. The greater the prosperity in any industry, the better for all the people. He fully endorsed what other speakers had said about the after-war campaign; they must use every precaution to conserve their energies. He himself held extreme views; they were dealing with an enemy that was as unscrupulous and dirty in commerce as on the field of battle, and as venom as exterminated without compunction, so we should use every available method of crushing the enemy. He would like to see the allied nations utterly exclude everything Teutonic— forbid German ownership of property, refuse to hold intercourse with them, shut out their goods entirely. They must give no heed to objectors; the devil was always there, and would break out again if the chance were given. No half-measures—let them bar out the Germans from any chance of commercial recovery, by completely closing the Allies' markets to them; the enemy would never overcome this handicap and again become a great commercial power. But if such proposals were too extreme, at any rate let them do all that they could to protect home markets, and combine to fight for the world's markets.

Mr. F. W. WILE, referring to Mr. Runciman's recent speech, said that that gentleman planted a most insidious idea in the minds of the British public when he said that Germany was already commercially a defeated nation, lulling the people into a false sense of security. He could hardly pick up a German paper that did not show that Mr. Runciman was utterly mistaken. In Germany the co-operation of the Government with big businesses was a great success; the German Government promoted trade by means of its diplomatic and consular services. The German State-owned railways and canals and the great shipping lines co-operated, and three departments of the Government, with business men at their heads, were devoted to the same purpose. Germany was now throbbing with movements and efforts directed towards the resumption of trade after the war, and was by no means commercially beaten. With 13 million square miles of territory and a population of 200 millions at her command, Germany was nowhere near famine, and could never be beaten by starvation—she would have to be knocked out on the field of battle.

Winding up the discussion, Mr. DAVENPORT said that most of them agreed with Mr. Wile that there was too much optimism. A concrete organisation should be created, with representatives of all the principal engineering associations, for the single purpose of improving British industry; it was the duty of the leaders to keep the British engineering industry in as powerful a position as possible. With regard to trusts, they had no desire to become a trust concern; they wished to adopt a reasonable and moderate policy, and the general desire to play the game would prevent the nauseous trust atmosphere from arising. The Association was ready to join with the central organisation in helping all British industries, and would do its share to bring about co-ordination and cohesion of the interests involved.

Mr. JAMES KEITH was unable to speak at the meeting, but communicated his views to the secretary. He wished to point out that Mr. Runciman had been rather unfairly criticised, whereas, for one thing, he had promised a new Patent Act, a matter of the first importance. Mr. Keith advocated the establishment of a real search for novelty and validity before an application for a patent was even entertained, the abolition of renewal fees, extension of the period of the patent to 17 years, Government protection for the *bona-fide* inventor, a special Court solely for trying patent cases, etc., and urged

that in the formulation of a new Act, inventors, engineers, and business men of the first rank should be taken into consultation. The revolutionary Act of 1883 was framed and carried by a business man—the late Mr. Joseph Chamberlain—whereas the 1907 Act was drawn up by a lawyer, and, hence, had practically failed to give anything like satisfaction or justice to British inventors. He called for the exclusion of German and Austrian trade from our business relations for ever. The appointment of a Minister of Industry and the improvement of the patent law would bring this country into line with the United States, which would undoubtedly be our future principal competitor for the world's trade, and Britain would then have every chance of holding its own in the coming struggle.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Electric Iron Connections.

May I draw the attention of the manufacturers of electric flat-irons, the numerous inquiries I have received for an electric flat-iron that will not require its socket connection rewired, after a few months' use? Almost everyone in the electrical profession must know of this trouble, which, I should say, is caused by the electric flat-iron, when connected to the supply, and not placed with its face on a heat-conducting substance, reaching a very high temperature. The heat is conducted to the terminals and socket connection, passing along to the flexible cord. The conductor itself becomes hot, the insulation is slightly charred, and very quickly the conductor breaks. I have carefully examined the broken ends of the conductor and noted the dryness of the insulation, especially between the break and the socket connector. Could not this trouble be obviated by introducing a perforated socket connector that would allow a cool draught of air to pass through it? Surely this improvement would bring the electric flat-iron to a higher state of perfection.

E. A. Deacon, Student I.E.E.

Twickenham, January 19th, 1916.

The Institution of Electrical Engineers and Alien Enemy Members.

The correspondence upon the above question and your references thereto have attracted considerable attention, and we have been much interested in the subject.

With your kind consent we now propose to state our views upon the alien enemy question in general, and its application to alien enemy members of the Institution. We wish to state at the outset that we think the alien enemy (whether naturalised or not) should, for the reasons set forth below, be excluded from any kind of association with true Britishers. The alien enemy has conclusively placed himself quite outside all claims to civility and consideration:—

1. By the ghastly atrocities committed in Belgium, France, Serbia, and other countries upon helpless and innocent non-combatant inhabitants (Lord Bryce's report deals pretty fully with these matters, but the cases dealt with in the report are the least horrible, many others, of which full records are kept, being quite unfit for publication, and representing horrors unspeakable).
2. By the deliberate and wanton murder of civilian passengers on board the *Lusitania* and many other liners and ships.
3. By air raids upon civilians in London and numerous other cities and towns, to say nothing of the destruction of valuable property.
4. By the use of dastardly methods of warfare, such as gas, liquid fire, explosive bullets and the like, before unheard-of in the annals of civilised warfare, and in direct contravention of its rules.
5. By the murder of Nurse Cavell.
6. By the diabolical treatment of Allied soldiers who have been taken prisoners by the enemy, but more especially those who are British.

These crimes against humanity have been committed, not only by common soldiers, but in innumerable instances by officers and professional men, who, in many cases, have been taken red-handed at their foul and devilish work, or whose acts have been described on oath by reliable witnesses. In other cases they have been committed by the direct command of high officers or by their knowledge and consent. So much for the very brief résumé of the acts and nature of these high priests of "Kultur."

The above proves that the alien enemy is either a degenerate of the vilest type, and his once much-lauded and advertised civilisation only the thinnest veneer, which was both put on and stripped off at will to serve his own unworthy ends, or he has always been at heart of the most brutal and degraded nature, and has succeeded in concealing the fact as long as it suited his plans.

In any case, he has effected his purpose in winning his way by treachery and deceit into the confidence of the world at large, and now laughs at the fools who accepted him at his own valuation and made a friend of him. In August, 1914, he began to reveal his true nature, and has continued to do so more and more plainly every day up to the present time.

It has been urged that to class the naturalised alien with all the others of his race generally would be an injustice. Suppose such may be the case with a few individuals; is it not better that a few may suffer some sort of injustice than that the many should escape punishment? How many thousands of innocent men, women and children have suffered the vilest torture and death at the hands of the bestial and brutal enemy? yet an outcry is raised because it is proposed to give a few naturalised alien enemies the cold shoulder. Cases have been cited of alien enemies who have been naturalised in England for a number of years and who have relatives fighting for us. We have frequently heard that the love of the alien enemy for his country amounts almost to a religion, and that patriotism is far stronger amongst them than amongst Englishmen. If that be so, and we have no reason to doubt it, the reasons for distrusting the naturalised alien are increased.

When the hypothetical alien (now naturalised for many years) first came to this country, he came not for his country's good, but obviously in his own interests. His attachment (if he has any) is, therefore, a purely selfish one, and if he is in accord with his sons or other relatives fighting against his Fatherland, he is obviously a traitor to his own country, and cannot, therefore, be trusted to be loyal to any.

Suppose the enemy succeeded in landing in England, and even reached London; which side do you suppose the naturalised alien would take, bearing in mind the record of his race? After all, his naturalisation is represented but by a scrap of paper, and as a leopard cannot change his spots, so the alien is an alien still, and can become de-naturalised as easily as he was naturalised, and, indeed, very much more easily, for all he has to do is to put the papers in the fire and he becomes a true and faithful member of the Fatherland again. No, sir, if a tiger lives in a stable, or is even born in a stable, he does not become a horse, but remains a tiger for the rest of his life, and, although he may be apparently tamed, his true nature will be revealed under provocation.

War with our present enemies (at one time our dear and trusted friends) has been forecast for years, and those who ought to know have said that it was not intended to embroil England at present, but when France and Russia had been laid low, and the enemy had had time to recuperate (say, in ten years or so), then England's turn would come.

In this connection it is instructive to note that Dr. Klingenberg delivered a few years ago at the Institution an address on how to supply light and power to London, and advocated one or two huge generating stations for the purpose, the present generating stations to be turned into sub-stations and distributing centres; in other words, putting all our eggs into one basket (or two at the outside). A scheme was ultimately proposed, more or less upon these lines, and was urged by the promoters as the ideal thing, whereby everybody was to get a supply for next to nothing.

Now, suppose this scheme had gone through, it would probably have been completed just in time to suit the enemy. An air raid or two, and what condition would London be in? Two well-aimed bombs upon two splendid targets, and London would be in a state of chaos. One more upon the gas works and the work would be complete; all lights out and munition works shut down. "Far-fetched," some may say; but is it? We know only too well, by bitter experience, the craft and foresight of the enemy. Ask America and practically every other civilised State in the world who are hag-ridden by the enemy, and can scarcely call their souls their own, what they think of it.

The danger to England is a very real one, for she has never before had to fight an enemy who does not possess a scrap of honour, or even common honesty, and as she cannot use similar weapons and means used by the enemy, she and her allies are at a great disadvantage, and have been from the beginning. If we had had an honourable foe to deal with the war would doubtless have been over long ago.

One fact is plain to all but those who wilfully, and perhaps intentionally, close their eyes, and that is that Germany must go under, or England will do so sooner or later. How anyone can have the slightest confidence in any member of a race possessing a philosophy and morality (or, rather, lack of morality) such as they possess, to say nothing of their blasphemous hypocrisy, is a mystery to all who are not biased in their favour, rather than in favour of their own flesh and blood and the land of their birth.

We have been told that many naturalised alien enemies have expressed their regret and horror at the foul acts of their countrymen. Quite so; and the Kaiser, according to his own statement, "wept tears of blood" for poor Serbia!

It is surprising that any action should be necessary to remove the names of alien enemies (naturalised or not) from the Roll of the Institution, as, knowing the public feeling in the matter and the diabolical acts of their own countrymen, they should have resigned long ago. We can only assume that, like their fellow-countrymen still in the Fatherland, their hides are too thick to be affected by any amount of castigation. Until the alien enemy is known for what he is

worth with all his scheming and plotting, and driven out of the society of decent men, we will set our faces against him, whether he is naturalised or not. We have not the slightest feeling against any individual personally, but we are supporting a general principle, and shall continue to do so even if a few, apparently harmless, are "sent to Coventry."

It is suggestive that the Government of Australia has just given notice that within three months all alien enemies, whether naturalised or not, must resign their holdings in any company incorporated within the Commonwealth. All honour to our splendid Colony for setting such an admirable example of patriotism to the mother country, who, we fear, badly needs it.

In conclusion, we reassert that we are wholehearted for the exclusion of all alien enemies, whether naturalised or not, from the Institution of Electrical Engineers and every other society of true Britishers.

Six Borough Electrical Engineers,
Member of the I.E.E.

P.S. Since the above was written a notice has appeared in your issue of January 21st that the Council of the Institution has passed a resolution that they are of opinion that Clause H of the Articles of Association provides sufficient means for the expulsion of undesirable persons (whether alien enemies or not) from the Institution. We would point out, however, that it would appear that under Article 41 *each case has to be taken separately*, and as this amounts to an attack upon individuals, we strongly object to this being done, as we have stated that we have not the slightest feeling against any individual personally, but are supporting a general principle.

Electrolytic Copper.

May I trespass on your space with just a few lines, even at the risk of repeating myself, in reply to Mr. Welbourn's courteous letter in your issue of January 14th?

His Manchester address was such an able expression of all-round knowledge of the subject that I should not venture to criticise anything except the scientist's tendency to succumb to the attractiveness of a formula.

Hard-drawn copper wire in various sizes is produced by various methods, partly from necessity and partly to suit the convenience of manufacturers, or the purpose for which it is used; consequently, the resulting properties have no fixed relation to the area or to the diameter, and it is impossible to define them by a single expression in terms of either of those throughout the whole range of sizes in use, without considerable inaccuracy at some point or other.

For this reason I have always deprecated the introduction of any formula such as Mr. Pye's as a standard definition, and I am strengthened in my objection by learning that this formula is actually being used by engineers. I think in such case they may, in many sizes, either be contenting themselves with an unnecessarily low grade of wire, or may be adopting a larger factor of safety than is needless, to the detriment of both economy and appearance in their work.

Although I write, as Mr. Welbourn truly remarks, from the point of view of the manufacturer, yet I believe the interests of manufacturers and users are practically identical in this matter, in so far as both want a specification for any given size of wire which will ensure its being the most suitable for its purpose that can be obtained without entailing undue cost or difficulty, either in manufacture or in testing. I do not think that either are particularly interested in a definition which is not capable of being used as such a specification, but may have the appearance of having been so intended. It was for this reason that the Standards Committee agreed to follow my suggestion and to make their definition simply a broad statement, marking approximately the dividing line between hard and soft copper, and I fear I must disclaim having any better definition to suggest. If, however, through the collaboration of scientists, users, and manufacturers, a standard specification for every size could be drawn up which the E.S.C. could adopt, we should have something of great practical value.

My idea of the procedure would be something on the following lines:

First collect together a considerable number of samples of wire of each of two sizes, one being comparatively thick, such as 3.0 or 4.0, and the other a thin size, say, 10 or 12 S.W.G., and on each of these sets carry out very complete tests, including breaking stress, elastic limit, limit of proportionality, extension, total elongation on fracture, as well as wrapping and bending tests—(torsion, I think, might be omitted as being somewhat liable to variation through differences of manipulation). An examination of the figures obtained would show how far a definite relation exists between the properties most valuable to users and the simpler tests which can be easily applied without liability to dispute. If the result were satisfactory, a much smaller number of tests on other sizes would be sufficient to establish the standard that might reasonably be asked for in the simple tests selected, and the properties which engineers could rely upon being proved by them.

THOS. BOLTON.

London, January 18th, 1916.

WAR ITEMS.

After the War Trade.—Speaking at a luncheon given in his honour at Cannon Street Hotel on Friday last, Sir George Reid, M.P., said, as reported in the Press:—"Might he suggest to those whom he was addressing that all the patriotism which they might devote to revising our tariff arrangements and our national trade would not come to much if they did not develop their own intelligence and reform their methods of trade. There was a wonderful slowness about this country. Practical business men were wanted to do spade work for the statesmen, each to go boldly into his own branch of industry, always bearing in mind the needs of the future. And when the spade work was done, then let the Royal Commission come. A multitude of interests had got to be established; and we must first rely on practical experts of British trade to prepare cases for the consideration of the statesmen. There were many men in the City who could render enormous services to the whole Empire by reviewing intelligently and earnestly all the facts of the present and the past in order to enable statesmen to make a really good piece of work of the restoration of the vitality of the Empire." Sir George Reid may take it for granted that if the statesmen of this country are really in earnest in regard to adopting a safe line for the development of the Empire in the future, they will not find the practical trade experts wanting in willingness to place their knowledge at the Empire's disposal. What the Empire will become in the years that follow the war must inevitably be influenced by the new trade and industrial policy that is evolved from all our present discussion and as the result of conferences with the Colonial and Allied representatives.

Registration of Firms Rejected.—In the House of Lords, on January 19th, Lord Southwark moved the second reading of the Registration of Firms Bill. According to the "Times" report, he explained that its object was to secure that every firm carrying on business in the kingdom under a trade name which did not consist of the full names of all the partners without any addition, and every person carrying on business under a trade name containing any name or addition other than the person's full name, should register the name under which the business was intended to be carried on, together with the nature and place of the business, the full name, address, occupation of the person or persons carrying on the business, and the names of any foreign partners. Germans and Austrians trading here were forewarned of the war and took English or French names or some trading name to conceal their origin. It was certainly desirable that trading under assumed names should cease. The practice had developed considerably during the last few months. The Duke of Devonshire said it would be a serious undertaking to compile a register of the kind suggested in the measure, and it would greatly increase the work of the Board of Trade in a time of great pressure. He suggested that the measure should be re-introduced in another Session with a view to its consideration by a Select Committee. The second reading was negatived.

Women Electricians.—Following upon a consultation with various officers of the Labour Exchange on the proposal submitted by him to the Liverpool branch of the Electrical Contractors' Association on the training of a certain number of women in branches of electrical work, Mr. Arthur Angers has submitted his scheme to the Minister of Munitions. In effect, his plan is that women from the age of 20 to 27 or 28 should be employed in the allied electrical trades, for the double purpose, he states, of releasing men to take an active part either in direct military service or else in war work, and of saving an important industry, which in normal times employs thousands of men, from bankruptcy. The positions found for these women must be vacated for the electrician-soldier after the war. The women shall be instructed in electrical work by qualified instructors, and shall, after passing an examination, be paid the same wages as men thus employed. After suggesting other details, Mr. Angers asks for a conference of representatives of the employers and of the Electrical Trades Union to consider the scheme.—"Liverpool Post."

German Capital in Swiss Undertakings.—A step recently taken by the Swiss Government shows that certain aspects of the present war have not failed to impart their natural instruction even in neutral countries. The A.E.G., of Berlin, were holders of shares in the Oberargau-Seeland Railway to the nominal value of 110,000 fr., on which 22,000 fr. were paid up. The Swiss Government have now called upon the railway company to repay this sum, with interest, to the Berlin company, and thus abolish the foreign investment. Similar action has been ordered in the case of a Strassburg company. These steps, it is stated, are taken in the interests of Swiss industry. Commenting on the matter, the Swiss journal "Electro Industrie," which, by the way, declares itself in sympathy with the Central Powers, observes: "Our authorities are beginning to show a true comprehension of the industry of the country and of a national method of thinking and acting."

Engineers Wanted for the Naval Air Service.—The Royal Naval Air Service calls for "skilled engineers, especially those with experience of internal combustion engines, for deferred entry or immediate service."

"Key" Industries.—Speaking at Huddersfield, Sir Algon Firth, president of the Associated Chambers of Commerce, said, according to the "Times," that the Advisory Committee which had been formed to consider what was necessary to continue the enterprise against German competition, had made its report, and this would shortly be published. Among the industries which had been considered were those in which Germans had specialised and had gained an absolute monopoly before the war. These were the "key" industries which manufactured basic materials so essential to the important industries of this country. The advisory committee had represented in their report to the Government that immediate steps should be taken, by a subsidy or a guarantee of protection to these new enterprises, to develop them by assuring, in the national interest, remuneration to those engaged in them. The committee hoped to extend investigations to other industries which the Germans had specially studied.

Serbian Relief Funds.—To avoid any possibility of confusion in the administration of contributions intended for the benefit of the distressed Serbian population, the Serbian Legation requests that subscriptions intended for the Serbian Relief Fund, of which H.M. the Queen is Patroness, should be sent to the Earl of Desart, K.C.B., at the offices of the fund, 5, Cromwell Road, South Kensington, S.W. The Serbian Legation will continue to receive subscriptions for the following Serbian funds:—The Archbishop of Belgrade's Fund, for the families of the killed and wounded soldiers. The Society of the Serbian Red Cross. The Parliamentary Commission for the Refugees. The Society of St. Helena, for the orphans whose parents have been killed in the war. All contributions addressed to the Serbian Legation (195, Queen's Gate S.W., London) for these funds will be gratefully received and acknowledged.

Australian Metals: The Enemy Control Question.—In the House of Commons, on Monday, Sir Philip Magnus asked the Secretary of State for the Colonies what had been the result of his communications with the Government of Australia respecting measures to carry out the desire of that Government to free the metals of the Commonwealth from enemy control and to encourage their development for the benefit of the industries of Australia and the British Empire. Mr. Bonar Law, in reply, stated that this important subject was one which the Prime Minister of the Commonwealth had telegraphed his desire to discuss personally with him during his forthcoming visit to this country.

Tyneside Engineers and the Dilution of Labour.—At a conference representing Tyneside members of the Amalgamated Society of Engineers, united machine workers, steam-engine makers, and electrical engineers at Jarrow, on Saturday, the Government proposals on the dilution of labour were discussed for three hours on the receipt of a report from the London conference. No resolution was come to on the report, but the meeting criticised the methods adopted by their leaders when they met members of the Government, and passed a resolution thereon.—"Birmingham Daily Post."

Russia After the War.—The "Times" states that the Russian Cabinet has decided to create a Higher Council of Ministers to consider questions relating to the country's economic, commercial, and industrial position in respect of the war.

War Bonus Refused.—The Portsmouth Corporation having decided to adhere to its decision to refuse to grant a war bonus to its employes, the men, who number some hundreds, and, it is stated, include those engaged in connection with the electric light and power system, gave notice that they would cease work on February 2nd unless such bonus were granted.

Germany's Pig-Iron Production.—The German output of pig-iron in December amounted to 1,029,144 tons, as compared with 855,186 in December, 1914, or 33,189 tons per working day, against 27,564.—"Times."

Enemy Trading in South Africa.—A Reuter dispatch from Durban says that an anti-German movement, the object of which is to induce the Government to prevent enemy subjects from trading within the Union, is being vigorously prosecuted.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Lamp-Locking Devices.

THE EDISON & SWAN UNITED ELECTRIC LIGHT CO., LTD., of Ponder's End, Middlesex, have forwarded us copies of their Leaflets Nos. A 3,128 and A 3,130, dealing with "Lamp Lock Specialities."

Fig. 1 shows a lamp-locking lampholder which can only be unlocked with a key held by the person responsible for the lighting arrangements. By this means thieving, changing small C.P. for higher C.P. lamps, &c., is eliminated, and a great saving assured to many large public buildings.

It will be seen that a pin passes through a channel in the lamp-holder, and, when locked by turning the key, the rounded end of the pin engages with the lamp cap, thus preventing the upward movement of the lamp necessary to release it from the bayonet catch.

Figs. 2 and 3 show a lamp-locking ring which can be used with any existing bayonet holder, plain or screwed, or batten holder.

FIG. 1.
LAMP-LOCKING
LAMP-HOLDER.

FIGS. 2 AND 3.
LAMP-LOCKING RING, SHOWING
METHOD OF ATTACHMENT.

Once the lamp is locked it cannot be removed until it is unlocked by the special key provided, which is sufficient to control any number of lamps.

The bayonet pins are engaged with the internal groove on the ring, through the slots in the ring; the lamp is put into the holder, and the ring turned round until the locking-pin is opposite the bayonet-slot, on the holder; the pin is then screwed down into the bayonet-slot with the key provided. When the lamp is securely locked, a small cap is slipped over the boss on the ring.

Mazda Revolving Lamp Shade.

We understand from the BRITISH THOMSON-HOUSTON CO., LTD., of Mazda House, 77, Upper Thames Street, E.C., that they have still available a few of the Mazda revolving lamp shades, such as we illustrate in fig. 4. This effective little advertising device comes to dealers packed in a neat flat packet containing all the necessary parts and simple instructions to enable it to be erected.

FIG. 4.—REVOLVING LAMP SHADE.

The shade proper rests on the tip of the Mazda lamp, the warm air from which, rising through the shade, operates an ingenious fan disk which causes the shade to revolve.

The advertising efficacy of devices in motion is doubtless familiar to readers, and this particular device can be employed, even where lighting restrictions are severe.

American Carbons for Italy.—An American Commerce report says:—"The Catania Street Railway and Lighting Co. has placed an order for 19,400 American light carbons as the result of a Trade Opportunity published in 'Commerce Reports.' This initial purchase of American lighting supplies for Catania is important in that subsequent orders will follow, in all probability, for other cities and towns in the district. As a rule, the difficulty lies in securing the initial order."

LEGAL.

THE ESSEX BATTERY AND MANUFACTURING CO.

ON Friday, before his Honour Sir W. Lucius Selfe, in the Marylebone County Court, Messrs. Napier, Kimber & Co., electrical engineers, Bayswater Road, W., sought to recover £28 17s. 6d., which had been paid to the Essex Battery Manufacturing Co., of Ilford.

MR. ARTHUR KIMBER, one of the plaintiff firm, stated that in November last they had 976 faulty batteries, 411 of which were returned to the company and the balance were waiting to be returned. £30 had been paid. The defective batteries were returned to the defendants, and as they were not redelivered he had made inquiries and found that they firm had gone away.

HIS HONOUR: What was wrong with them?

WITNESS: We could get no voltage from them. These refills are guaranteed for six months, and in three weeks they were useless. I sent to Ilford to see about the defective batteries, and found the works closed and the firm gone.

HIS HONOUR: And I expect your money has gone with them. You can have judgment for what it is worth, with costs.

BELFAST SLANDER ACTION.

IN the King's Bench Division, Dublin, before Mr. Justice Madden, Mr. T. W. Brown, on behalf of Mr. Alex. Bryce Farrell, of Ravenhill Park, Belfast, resident superintendent in the central electrical station at East Bridge Street, plaintiff in an action against Mr. Thos. W. Bloxam, chief electrical engineer for Belfast, applied for an order for the discovery of documents. He stated that the action was for slander of, and concerning the plaintiff, in the way of his business. Plaintiff's complaint was that on October 29th, 1915, defendant stated to Alderman Tyrrell and Councillor Duff, at the electrical station: "Main feeder cables in the tunnel in subway were supported and clamped in a manner likely to destroy the cable, and to be a danger of fire in the station, and that Farrell was responsible for this; that cheap cotton 'flex' was used where cables should have been used as a lead for current to a lamp at a small auxiliary engine, and that Farrell was responsible for that; and that Farrell was irreconcilable, and was causing disorganisation in the station, so much so that he (defendant) would prefer to carry on the next two months' work without anyone, rather than with Farrell." The plaintiff said that the works referred to were done under the direct superintendence of the defendant; that defendant signed the order for the materials; and that if anyone was responsible, it was the defendant. The defence, Counsel added, was a traverse of the cause of action, and, in addition, a plea was entered that the communications were privileged.

MR. JUSTICE MADDEN made the order applied for.

PORT OF LONDON AUTHORITY'S APPEAL.

ON Friday the Court of Appeal, composed of Lords Justices Swinfen-Eady, Pickford and Bankes, disposed of an appeal by the Port of London Authority against the refusal of the Lord Chief Justice to enter judgment in their favour in an action brought against them by the widow of an electrician named Blatch, who fell into a graving dock belonging to the appellants, and was drowned. The accident occurred on a dark and foggy night when the deceased was returning from the Millwall Dock, where he had been employed on a ship, in connection with certain electrical fittings. At the trial the jury disagreed, and the defendants applied for judgment. The learned Judge, however, would not accede to this, and the plaintiff set the case down for retrial. The present appeal was advanced so that it might be disposed of before the case was reheard.

Their Lordships allowed the appeal, and entered judgment for the defendants, holding that there was no evidence called by the plaintiff of any breach of duty by the defendants towards the deceased, nor any evidence that the defendants omitted any precautions usually or ordinarily taken by the owners of graving docks.

MUNITIONS CASES.

AT a sitting of the Oldham Munitions Tribunal last week, a local electrical firm complained that a volunteer munitions worker had committed a breach of Sub-Sec. 1 of Sec. 6 of the Act—a Sub-Section which makes it an offence for a munition volunteer who enters into an undertaking with the Ministry of Munitions to act in contravention or not fully to comply with the undertaking. It appeared that the man had been working for the firm for some years, and on January 11th he ceased work and refused to go back, stating that he was tired of the job and felt unsettled. The Trade Union Secretary stated that although the man was a munitions volunteer he had never been "transferred" to the works by the Ministry of Munitions.—Mr. W. Sellers (President): But he was working there when he became a volunteer.—The Secretary stated that there were hundreds in the country similarly situated, but they did not come under Sec. 6 until they were transferred and their war badges were changed. The badge was not changed until the man was transferred.—The employer said he would take the workman back at once, and the Trade Union official said he would advise the man to return.—The President of the Tribunal, agreed to a suggestion that he should cause a letter to be sent to the Ministry of Munitions asking for a ruling as to when a man was to be considered transferred. Such a ruling, it was stated, would be of great value in the country.

AN IRISH ARBITRATION.

MR. A. E. PORTE, M.I.C.E., has concluded arbitration proceedings in Dublin concerning a dispute between the Marquis of Sligo and Mr. T. E. Brunner, electrical engineer, Dublin, in respect of an installation of electric lighting in Westport House, Co. Sligo. Mr. Brunner claimed £100 as extras, which were disallowed by the architect, Mr. R. E. Mellon, Dublin, and a sum of £150 was deducted for work alleged not to be in conformity with contract. Lord Sligo counterclaimed for penalties for delay.

The ARBITRATOR said he would inspect the premises before giving his decision.

BUSINESS NOTES.

Wholesale Traders' Association.—The 13th annual meeting of the Wholesale Traders' Association for the Protection of the Hardware, Furnishing and Metal Industries, Ltd., was held at the registered offices, 26, Corporation Street, Birmingham, on January 17th, Major J. H. Cartland, J.P., presiding.

The chairman, in presenting the report and balance sheet, referred to the death of Mr. Thos. Cumberland, who, as late chairman, had presided over the deliberations of the Board since 1902. The operations of the Association had again been fully maintained, and the members had made extensive use of its various departments, which had afforded them exceptional facilities and assistance in many directions in the present crisis. 189 new members had joined the Association during the past year bringing the total membership up to 3,082. The speaker said that notwithstanding the war and the fact that a large number of firms were doing Government work, and, therefore, were not seeking to open new accounts, the number of status inquiries sent in during the year had reached the total of 92,173, thereby showing that there was still a good general trade being done by the various manufacturers and merchants throughout the country, and that a large number of orders had been received from Foreign and Colonial markets, which they were unable to execute at the present time. With regard to the debt recovery department, the number of cases sent in for collection was 19,233 against 18,126 during the previous year, showing an increase of 64 per cent., and representing a total credit of upwards of £171,000. Out of this sum he was able to report that only about 10 per cent. proved irrecoverable or bad. With regard to the insolvency department, companies' liquidations, &c., a large number of cases were reported to the Association during the year, meetings attended, and action taken in the interests of members. In several instances the result has been an increased dividend for the creditors, and it was essential that members should make the fullest use possible of this department as occasion arose. There was still an impression in the minds of some of the small traders that a sort of moratorium still existed, and that there was no reason to pay their debts. This, of course, was absurd as the only exception now prevailing was that no person should have judgment enforced against him by execution, if there was reason to believe that the debt was owing to adverse circumstances brought about by the war. It was reported that a Bill was shortly to be introduced in the House of Lords for the registration of persons and firms carrying on business in Great Britain and Ireland, and this was a measure which the Association had long advocated through different channels for some time past.

Liquidations.—J. WHITEHOUSE, LTD., 15, The Parade, Golder's Green, Middlesex.—The winding up order in this matter was made on the petition of two creditors, and according to the figures prepared, the liabilities amounted to £993, to meet which there are assets of £917. After deducting the claims of preferential creditors and claims of debenture-holders, the assets were reduced to £167, the estate disclosing a deficiency of £827 as regards the unsecured creditors, whilst as regards the contributories the deficiency amounts to £1,981. It appears that the company was registered on June 23rd, 1914, and was formed to take over as a going concern the business of an electrical engineer, &c., carried on by J. Whitehouse, at 15, The Parade, Golder's Green. The contract for sale to the company was dated August 22nd, 1914, and it provided that J. Whitehouse should sell to the company the goodwill and connection of the business of electrical engineers formerly carried on by J. R. Whitehouse, and the stock, fixtures, plant and book debt, and also the leasehold hereditaments belonging to him, and he agreed to grant a sub-tenancy of his shop at an annual rent of £100. The nominal capital of the company was £3,000 divided into 3,000 shares of £1 each. The company was promoted by Mr. Whitehouse. The property acquired by the company totalled £2,297 odd, while the liabilities were stated to be £1,152 unsecured, the proprietor's capital being £1,145. The trading account for the six months to June 30th, 1914, shows a net profit of £426 odd on a turnover of £1,858, the productive wages being shown at £300, and other drawings and salaries £171. The consideration to be given by the company was, as to part, the allotment to him of 1,155 fully-paid shares in the company, and as to the remainder an undertaking by the company to pay all debts and liabilities of the vendor in relation to the business. The shares were duly allotted to J. Whitehouse, who still holds them. The first director of the company was J. Whitehouse, and he was appointed permanent managing director under the articles. Mrs. Whitehouse is also said to have been a director, but there is no record of how she

became one, as she was not nominated under the articles, nor was she elected at any meeting so far as the minute book shows. Mrs. Whitehouse appears to have resigned as a director on August 14th, 1915. By a service agreement with the company J. Whitehouse was to receive a salary of £312 a year and £208 a year for expenses, and on December 20th, 1914, Mrs. Whitehouse was voted a sum of £55 to cover the director's fees and expenses incurred. This sum appears to have been taken to the credit of J. Whitehouse's salary account. The company being a private one, no capital was offered for public subscription nor was any prospectus issued. Mr. Whitehouse holds 1,155 shares in the company, and Mrs. Whitehouse is the holder of one share. From the minute-book, however, it would appear that applications were made for two shares by another person, and it was resolved that these should be duly allotted to him. No share certificate book has been produced. Apparently the company ever since its formation has traded at a loss, there being, in fact, a net loss of £247 on the trading for the first 12 months. The failure is ascribed to stoppage of work owing to the war, although in November, 1914, the company extended its business by taking additional business premises at Child's Hill. Further investigation is to be made into the affairs of the company.

CANADIAN-BRITISH ENGINEERING CO., LTD.—This company is winding up voluntarily with Mr. R. G. Sidford, 20, John Street, Adelphi, W.C., as liquidator. A meeting of creditors is called for February 1st.

SCIENTIFIC MANUFACTURERS, LTD.—This company is winding up voluntarily, with Mr. A. H. Partridge, 3, Warwick Court, Holborn, London, as liquidator.

HELE-SHAU PATENT CLUTCH CO., LTD.—This company is winding up voluntarily, with Mr. W. G. Needham, Holly Bank, Oldham, as liquidator. A meeting of creditors will be held on January 31st, at Hartford Works, Oldham.

AUTOMATIC ELECTRIC BLOCK SIGNALLING CO., LTD.—This company is winding up voluntarily, with Mr. A. Colls as liquidator.

ELECTRIC RAILWAY SIGNALLING SYNDICATE, LTD.—A meeting is called for March 1st, at 32, Great St. Helens, E.C., to hear an account of the winding up from the liquidator, Mr. C. F. Palmer.

Bankruptcy Proceedings.—G. E. BONNER, electrical agent, 105, Fox Lane, Palmer's Green, Middlesex.—Receiving order made January 19th, on debtor's petition.

Book Notices.—"Key to the London Telephone Directory and Business and Trades Directory." Vol. II, No. 2, September, 1915, to April, 1916. London: W. H. Smith & Son. Price 5s. net.

"Annuaire pour l'An, 1916." Paris: Gauthier-Villars et Cie. Price 1 fr. 50.

"The Two-stroke Engine." By Dr. A. M. Low. London: Temple Press, Ltd. Price 1s. 6d. net.

Calendars, Catalogues, &c.—MESSRS. ALFRED GRAHAM & Co., of St. Andrew's Works, Crofton Park, London, S.E., have sent us one of their desk blotting pads, with diary pages interleaved with blotting at the left-hand side. They have also issued their usual useful book of time and speed tables for 1916.

MESSRS. THOMAS WHITTLE & SONS, LTD., Warrington.—40-page catalogue, giving full particulars and sizes of their patent belting, which is a combination of leather and steel links. A large number of excellent half-tone pictures show the application of the belting in the driving of electrical and other machinery.

MESSRS. SIEMENS BROS. & Co., LTD., Woolwich, S.E.—Reprint of pages 908-908 of their Catalogue No. 510, giving revised prices of their jointing materials consequent upon the alterations in cost of materials, &c.

MESSRS. A. G. THORNTON, LTD., Paragon Works, King Street West, Manchester.—Two new catalogues—drawing office and pocket edition respectively—of drawing, surveying and scientific instruments and drawing office materials. The former is a publication of nearly 450 pages, and it contains illustrated descriptions, price particulars, and a telegraphic code, relating to a very complete collection of instruments and equipment. The pocket edition consists of some 160 pp. of material concerning a selection of instruments and materials suitable for draughtsmen and students. The first of these catalogues was in preparation prior to the outbreak of war, and the prices therein are based on pre-war factory costs.

"Z" ELECTRIC LAMP MANUFACTURING CO., LTD., Standon Road, Southfields, London, S.W.—Catalogue No. E 502 giving some particulars of the "Z" drawn-wire lamps and half-watt lamps, also prices of same. The pictures include some views of the stores, the filament winding department, and the test-room at Southfields.

MESSRS. ISENTHAL & Co., Denzil Works, Willesden, N.W.—32-page illustrated catalogue and price list of slate rheostats of many different types, also tubular rheostats. Diagrams of connections are given. The rheostats are of all-British type and manufacture, and they are finding an increasing market in the Allied countries. Two other sections of the catalogue dealing with field, are lamp resistance, dimmers and special types, are in preparation, and will be issued shortly.

MESSRS. J. H. TUCKER & Co., King's Road, Hay Mills, Birmingham.—Detailed lists of fuse and distributing boards, main switches, and miscellaneous items that are in stock.

THE NOTTINGHAM SOCIETY OF ENGINEERS has sent us one of its pocket diaries for 1916. A full list of officers and members of the Association is given, also a list of kindred Associations, together with a number of engineering advertisements, three preceding a Letts's note-book and diary.

Private Arrangement.—**JOSEPH PERCY ANDREW**, trading as the Ray Electric Co., 82, Woodgrange Road, Forest Gate, and 350, High Street North, Manor Park, electrical engineer. A meeting of the creditors of the above was held on Monday, at the offices of Messrs. Henry Sydney & Son, solicitors, 185, Aldersgate Street, E.C. A statement of affairs was presented which had been prepared by Messrs. Poppleton, Appleby & Hawkins, and which showed total liabilities of £1,706, exclusive of a claim by the debtor's wife for £55 for money lent. The liabilities included a claim by the debtor's father for £300, money lent, and there were two other cash creditors whose claims aggregated £78, while the claims of the German trade creditors amounted to £309. Mr. E. H. Hawkins stated that the debtor started trading, in partnership, at 339, High Street, Manor Park, in November, 1906. No deed of partnership was entered into, but the debtor and his partner each agreed to put in £100, and the profits and losses were to be equally shared. The debtor's £100 was lent him by his father. The debtor was to draw £1 a week, while the partner was to have £2 weekly. In June, 1908, the partnership was dissolved, and the partner retired. The assets were then valued at £200, and the liabilities at £40, and it was agreed that the outgoing partner should receive £100. The debtor paid £50 of that amount down, and the balance of £50 he borrowed from his father. Since that date the debtor had traded alone. In 1909 the debtor removed to 350, High Street North, the premises being held on a lease at £55, rising to £60 per annum. In 1913 the debtor found he was trading at a profit, and he decided to open another shop at Green Street, Upton Park, where he acquired premises at a rental of £50 per annum. Last December he removed the stock from that shop, and sold the goodwill and his interest in the premises for £40. In March, 1914, still thinking he was making a profit, the debtor opened the Woodgrange Road shop, which he acquired at a rental of £65, rising to £70 per annum. The debtor agreed to spend £300 on improvements to the premises, and had paid £242 for alterations. Mr. Hawkins added that the assets were estimated to realise £568, but from that amount had to be deducted £90 for preference claims, leaving net assets of £478.

In answer to questions, Mr. Hawkins stated that some creditors had obtained judgment against the debtor. During the year ended March, 1913, the sales were £4,098, while in the following year they increased to £6,132. In the next 12 months they were £6,069. Since last March the sales had fallen off somewhat. The drawings had been at the rate of £3 a week.

Mr. Sydney, on behalf of the debtor, made an offer of a composition of 5s. in the £, payable by four equal quarterly instalments, the cash creditors postponing their claims.

Mr. Hawkins said that the money necessary for the payment of the amount of the composition to the German creditors would have to be found by the debtor, and it would then be handed over to the Public Trustee.

Several creditors intimated that they were not prepared to accept 5s. in the £, and Mr. Sydney increased the offer to one of 6s. 8d. in the £, payable by five quarterly instalments. After a short discussion, it was decided to accept the amended offer, and it was also resolved that a deed of assignment should be executed, with Mr. E. H. Hawkins as trustee. A committee of inspection of the principal creditors was appointed. The following are creditors:—

G. G. Bussey	45	Robin Hood Cycle Co.	14
East London Rubber Co.	17	Pitco Electric Co.	24
Foster Engineering Co.	21	Waimley & Sons, Ltd.	16
Elwick Hopper Co.	30	Johnson & Phillips	21
Butcher & Sons	35	Clemons Bros.	36
Summers Bros. & Co.	31	Turner & Burger	12
Dunlop Rubber Co.	13	Jaeger Bros.	162
Times Electric Co.	60	Lothman & Co.	135
New Polyphon Supply Co.	17	H. Polachensfeld & Co.	65
New Hudson Cycle Co.	12	Stern & Co.	15
Bryans, Ltd.	20		

Trade Announcements.—**MESSRS. ELECTRA, LTD.**, of 1, The Triangle, New Barnet, N., state that they are inaugurating a new scheme of insurance and maintenance of motor-car lighting sets and electrical accessories.

MESSRS. BOVING & CO., LTD., who have now removed to their new premises at Imperial Buildings, 56, Kingsway, London, W.C., have in circulation a booklet containing some excellent views of these premises.

MESSRS. THOMAS & BISHOP have removed to 37, Tabernacle Street, in order to have their general offices, stores and works under one roof. All general correspondence and goods should be addressed there. The accounts departments will continue at 119-125, Finsbury Pavement, E.C.

German Catalogues.—In order that British manufacturers may have an opportunity of familiarising themselves with German methods of publicity, the Board of Trade have collected over 3,000 specimen catalogues of German origin, illustrating a great variety of industries, and these may be inspected at the Foreign Supplies Section of the Commercial Intelligence Branch, 32, Cheapside, London, E.C. A complete index of the catalogues has been prepared, rendering identification of any particular catalogue a simple matter. Arrangements have been made whereby catalogues may be lent for a few days to United Kingdom firms established in the Provinces.—*B. & E. Journal*.

For Sale.—The Salford Electricity Committee invites tenders for one Browett-Lindley three-crank, three-cylinder Uniflow engine, direct-coupled to Mather & Platt D.C. generator, and one Browett-Lindley six-cylinder compound engine, direct-coupled to Mather & Platt D.C. generator, both sets complete with jet-condensing plant. Particulars are given in our advertisement pages to-day.

Trade in China: Catalogues Wanted.—**H.M. Commercial Attaché at Peking** (Mr. W. P. Ker, O.M.G.) reports that the Chinese Ministry of Agriculture and Commerce have recently established a Commercial and Industrial Commission, whose object is the collection of statistics and the development of Trade in China, and that this Commission desires to receive copies of catalogues issued by United Kingdom manufacturers, United Kingdom manufacturers, and exporters of U.K. goods, who may be interested, should address catalogues and price lists of their goods to the Commercial and Industrial Commission, Ministry of Agriculture and Commerce, Peking.—*B. & E. Journal*.

An Inquiry from British Columbia.—**MESSRS. P. F. LETTS & Co.**, electrical engineers and contractors, of 3,044, Granville Street, Vancouver, B.C., wish to receive catalogues, prices &c., from manufacturers of silk shades for electrical table, floor, and candle lamps.

LIGHTING AND POWER NOTES.

Aldershot.—**REVISED TARIFF.**—The U.D.C. has adopted a revised scale of charges for electricity for power and heating, varying from 2d. per unit for under 250 units per quarter, to 1½d. per unit for over 2,000 and under 5,000 units; beyond this amount a special arrangement will be made. The lighting accounts, as from March 31st, will be increased by 10 per cent.

Argentina.—The municipality of the city of Santiago del Estero has voted \$300,000 for the cost of installing a power house for the public supply of electric light and energy.

The latest electrical news of importance from the Argentine Republic is as follows:—The electric light and power installation now in course of construction in the progressive town of Villa Canas, in the province of Santa Fé, will shortly be completed and ready for the inauguration ceremony. The inauguration has just taken place of the electricity station, recently constructed at Montevideo, by Messrs. Obonello & Brothers. Proposals have been made to the authorities of Lules, in the province of Tucumán, to light that town from the electric station situated in the neighbouring townships of Concepcion and Tañi Viejo. The municipality of Colon has received the plans of the projected electric light installation, and so soon as they are approved, the contractors, Messrs. Klug & Hubscher, will begin operations. At Nogoya the large flour-milling company, the Sociedad Anonima Molinos Harineros y Elevadores, have arranged for the equipment of their new mill with electric driving.

Australia.—A majority of the ratepayers of Balaklava, South Australia, has decided in favour of borrowing £3,750 for the purpose of installing electric light. The question was first discussed four years ago.—*Tenders*.

The annual report of the Port Melbourne municipal electric light and power scheme inaugurated two years ago, shows receipts amounting to £4,514, and expenditure to £3,782; the year's revenue included the following:—Private consumers for power, £2,020; for lighting, £1,408; street lighting, £981; the expenditure included £2,403 paid to the Melbourne City Council for electricity. From the year's profit of £752, £239, the debit balance of the previous year, has to be deducted, leaving a profit of £513 for the two years.

The city electrical engineer of Melbourne, in his report on the proposal to install electric lighting in city premises on extended terms of payment running to 30 months, states that the greatest objection to the scheme would be the very large number of bad debts the City Council would be liable to incur. It would also be necessary to obtain legislation allowing the Council to make the payments a first charge on the land. The engineer does not consider the scheme would be availed of to an extent to justify its adoption; landlords would not be willing to bear the expense of the installation even if it were spread over a period without increasing the rents; the only class of property for which he could recommend the scheme would be where the owner was also sole tenant.—*Australian Mining Standard*.

The Wollongong Municipal Council has adopted the plans and specifications of Mr. J. R. Rumford for an electric light installation, the maximum demand being put at 105 kw. Electricity will be supplied from the Department of Public Works power house at Mount Kembla; 23 miles of reticulation are specified. The contractor is providing the installation on terms of payment extending over 10 years.

The Mudgee Electric Lighting Co. has installed a small steam generator set for the day load, and a new battery is to be obtained by the company, which is also in negotiation for a new generator set from South Australia, to take the place of a set ordered in England, and unobtainable owing to the war.—*Sydney Telegraph*.

N.S.W.—ELECTRIC WINNERS.—Two electric winners are in use in the coal mines of New South Wales, one being at the Aberaman Colliery and the other at the Richmond Main Colliery. The first-mentioned is connected through gearing to a 105-H.P. D.C., 250-volt motor, and is used to draw coal from the bottom to the top seam. It is operated by means of a reversible controller and powerful foot-brakes. The winner at Richmond Main is direct-coupled to an 800-volt D.C. motor of 800 to 1,850 H.P., and is fitted with over-speed and over-winding gear, also compressed-air brakes. It operates on the Siemens-Igner system, a fly-wheel converter set being installed. A clutch is provided so that the

fly-wheel can be put out of gear, and the winder worked on the Ward-Leonard system when the loads are light. As this mine is only in the development stage, no figures as regards the capacity of the winder are available.—*Australian Mining and Engineering Review*.

Aylesham.—E.L. SCHEME.—The P.C., after discussing with Mr. Chas. H. Best, of Bradford, and Mr. Pullan, details of an electricity scheme for the parish, using overhead cables, has passed a resolution welcoming an efficient scheme of electric supply, but without taking any action in the promotion of a company for the purpose. Mr. Best proposes to float a company with a nominal capital of about £3,000, and to supply current for lighting at 6d. per unit, with a substantially lower rate for power and heating.

Bradford.—WAR BONUSES.—The Special Committee appointed to consider the question of war bonuses to the employés of the various departments of the Corporation, has decided to recommend that it is desirable to maintain the principle of dealing with any adjustment of wages during the war by means of war bonuses rather than the revision of the wage standard. The Committee also recommends a revision of war bonuses as follows: 3s. a week for men over 19, where the wages do not exceed £3 a week; 2s. a week for male employés under 19, and female employés 2s. a week all round.

Ballater.—E.L. SCHEME.—Application has been made to the B. of T. by Duncan's Electricity Supply Co., Ltd., for consent to the erection of 230-volt overhead transmission lines throughout the burgh of Ballater, for the purposes of supply under the Ballater Electric Lighting Order, 1914.

Bedford.—Messrs. W. H. Allen, Son & Co., Ltd., have informed the T.C. that they are installing a further 250-kw. motor-generator, so as to enable them to take the whole of their supply from the electricity undertaking, instead of it being necessary to run their own plant as well. The existing mains, it was stated, would be large enough to take the increased demand provided a synchronous motor-generator was installed, and this the firm had agreed to put in. The Council has decided to provide the necessary additional meters and switchgear, at an estimated cost of £130.

Brighton.—PROPOSED TARIFF INCREASE.—At the last meeting of the T.C., the electrical engineer submitted a further report on the situation that has arisen in connection with the electricity undertaking owing to the war. He considers that there will be a possible increase for the year of £8,000 in the cost of coal and a decrease in consumption, together estimated to cause a deficit of over £5,000. The Electricity Committee, on the advice of Mr. Christie, recommended a flat rate of 5½d. per unit for all classes of consumers, excepting for power and tramway supply, subject to reductions of ½d. per unit for each additional 1,000 units after the first 1,000, with a minimum of 3½d. per unit for everything over 4,000. The change is estimated to produce an additional revenue of £12,000, the proposals to take effect from the March quarter. After a long discussion the whole matter was referred back to the Committee.

Chislehurst.—The Foots Cray Electricity Co. has decided to make a quarterly charge of 1s. per meter from January 1st last. The Finance Committee of the U.D.C. reported that although no charge for meters had hitherto been made, the company had adopted this course rather than increase the price of current.

Coniston.—E.L. SCHEME.—The Ulverston R.D.C. has again deferred the question of signing a draft agreement with the Coniston E.L. Co. for a scheme for electric supply in the parish, and decided to submit the agreement to counsel for advice regarding certain clauses.

Continental.—ITALY.—In consequence of the enormous rise in the price of coal in Italy, the municipality of Vercelli has decided to draw upon the hydroelectric works of the Società Officine di Energia Elettrica, di Novara, for current for lighting and power for the period from dusk to dawn, reserving its own steam plant for the remainder of the 24 hours. The position of Vercelli is typical of very many cities in Italy at the present time.

Darlington.—The output of the municipal electricity works for December was 665,127 units, an increase of 29·65 per cent. upon the figures for December, 1914. During the nine months ended December 4,347,064 units were generated, being an increase of 715,482 units, or 19·97 per cent., for the year to date.

Dublin.—A number of motors have been installed in a new factory at Parkgate Street, and will be supplied from the Corporation electricity mains, it being estimated that at least 600 H.P. will be required to keep the factory running. The factory will be in full work by March 1st.

Dungannon.—E.L. SCHEME.—The Provisional Committee for the introduction of public electric lighting proposes to erect the generating plant at a waterfall, at Altmore, about six miles from the town, where riparian owners are giving every facility. The new company will be worked on co-operative lines. Already a considerable sum of money has been subscribed.

Edinburgh.—NEW POWER STATION.—The T.C. has adopted the Electric Lighting Committee's report recommending approval of the plans for the Portobello power station, and that estimates be obtained. The report stated that the cost of the work for which tenders have been accepted was £93,369, and the estimated cost of the remainder of the work was £106,215, a total of £199,584. The purchase price of the site of the station was £15,800, including a certain amount of property which would continue to yield revenue for some years.—*Edinburgh Evening News*.

Eton.—HOSPITAL LIGHTING.—The R.D.C. has accepted the offer of the Electricity Co. to supply current to the isolation hospital at 6d. per unit on a five years' contract. The company recently advanced the price to other consumers to 6½d. per unit.

Fleetwood.—NEW PLANT.—The electrical engineer to the U.D.C. has been authorised to proceed with his scheme for providing apparatus for softening and filtering water from the Clough for the electricity works.

Greenock.—Figures for the output of the Dellingburn electricity works, for the month of December, show 2,568,032 units generated, an increase of 1,104,188 on the corresponding period of last year.

Hull.—The acting city electrical engineer (Mr. McGoris), in the absence of the engineer (Mr. Bell), who is now with the Forces, has prepared revenue estimates of the Corporation electricity undertaking for the financial year ending March 31st, 1917. He estimated that the receipts would be £93,970, and that there would be a balance, after interest on loans and contributions to sinking funds amounting to £35,235 had been met. The estimates were approved. A number of applications for increases of salary were referred to a Sub-Committee for consideration.

India.—The electrical scheme of the Allahabad Municipal Board is making progress, and the company hopes to complete the work by the middle of April next.—*Indian Engineering*.

Keighley.—MOTOR HIRING.—The T.C. has decided to purchase no further motors for letting out on hire, but existing arrangements with consumers already supplied will be continued, and motors returned from hire will be relet to fresh customers.

Letchworth.—The output of the First Garden City Co.'s electricity works for the year 1915 was 907,000 units, as against 582,510 for 1914. During the year considerable extensions have been made, which, when completed, will give a total of 2,140 H.P. of plant installed at the electricity works.

Limerick.—YEAR'S WORKING.—At a meeting of the Corporation it was stated that the electric light works were now paying, a deficit of £1,700 having been wiped out during 1915, and a profit of £500 recorded.

London.—ST. PANCRAS.—On November 24th the borough treasurer submitted a statement of electricity capital expenditure for the year ending March 31st, 1916, showing that sufficient balances are in hand to meet the estimated requirements for the remainder of the year, and that it would be unnecessary to borrow further.

The Finance Committee has received a communication from the L.C.C. stating that the loan of £8,970 last granted was based upon the estimated expenditure in 1914-15 under the head of mains £8,000, and that it now appears that the actual expenditure on mains in that period was £1,057 only; the Council therefore asks the B.C. to repay the sum of £2,587 advanced in respect of estimated expenditure in 1914-15 upon electricity mains (which with £5,413 in hand under this head at March 31st, 1914, made up the £8,000 referred to).

The Finance Committee, in reply to a communication to the L.C.C. as to the urgency of sanction being received for a loan of £13,000 in respect of the King's Road electricity station extension, has been informed by the Controller of the C.C. that his Finance Sub-Committee has agreed that the application should be proceeded with.

The Electricity Committee recommends that the L.C.C. be informed that it is intended to extend the feeder mains in the Northern and Prince of Wales Road district, at an estimated cost of £4,526; and that the £2,587 will be absorbed by this extension. The Finance Committee approves the recommendation.

The Electricity Committee has received a petition from the station mains staff for 15 per cent. increase in their wages in lieu of the present war bonus. The Committee is of opinion that the Council should reconsider the whole question of the war bonus now in operation.

The engineer recommends that the remaining 250 arc lamps be converted for incandescent lighting; he also reports that his amended estimated expenditure for 1915-16 will reduce the amount by £2,395, and the expenditure next year will be further lessened by £750 in respect of the hire of the Ljungstrom turbines, and £551 for watching the stations, which will not be necessary.

L.C.C.—ELECTRIC COOKING.—The Education Committee has decided to continue for a further period of one year the electric cooking stove installed as an experiment at the Maxey Road (Woolwich) Domestic Economy centre.

The Finance Committee of the L.C.C. has sanctioned a loan of £2,618 to the Battersea B.C. for electricity mains.

Lincoln.—The T.C. has applied to the B. of T. for consent to use overhead lines, in order to supply current to premises at Foss Bank.

Monaghan.—E.L. SCHEME.—A public meeting of rate-payers has authorised the Council to give consent to the Monaghan Lighting Co. to erect poles and wires in the streets for the introduction of electric lighting.

Newbridge (Co. Kildare).—HOSPITAL LIGHTING.—At a meeting of the Governors and friends of the Drogheda Memorial Hospital, it was announced that electric light was being installed in the institution.

Rawtenstall.—Large consumers of electricity for power and lighting have recently asked the Corporation to supply the current for lighting at the same rate as that for power, but the application has not been granted.

Rugby.—The T.C. has agreed to supply current for power purposes to the Rugby Sparking Plug Co., on terms varying from 1½d. per unit for under 10,000 units, to 1d. per unit for over 15,000 units per year.

Swinford (Co. Mayo).—In the annual estimate of expenditure by the clerk of the Union, £140 is allowed for electric lighting of the town in a special area fixed for that purpose.

Wallasey.—In regard to the failure of supply from the new generating station on January 11th, the engineer reports to the Council that it was due to stoppage of circulating water, and the plant was in operation again after three days.

West Ham.—The money now being required for current expenditure, the Finance Committee has recommended the Corporation to apply to the L.G.B. for a consent order authorising the raising of the unexercised balance of £2,000 of the loan of £17,500 granted in January, 1914.

Wigan.—E.L. FAILURE.—The Corporation electricity supply, which had been in a precarious condition all day, failed on Friday evening last. Anticipating trouble, a warning had been issued to consumers during the afternoon and the tramway service suspended. Apparently trouble has arisen owing to the hard water used for boiler feeding purposes and the non-delivery of new boilers, and the Electricity Committee is trying to arrange with the South Lancashire Tramways Co. for a temporary supply of current, as the company's cables practically meet those of the Corporation at Hindley.

It is calculated that the town will lose £1,000 in tramway revenue, in addition to the loss on lighting and power revenue.

Wolverhampton.—PROPOSED LOAN.—The T.C. is making application to the L.G.B. for its sanction to the borrowing of a sum of £1,780 for mains extensions in connection with the supply of electrical energy to certain manufacturers; and also for the Board's permission to the expenditure of £670, out of loans already raised in connection with the same extensions.

TRAMWAY and RAILWAY NOTES.

Argentina.—The inauguration of the No. 12 line of electric tramways at Rosario is reported. This line has been three years in the process of construction.

Ashton-under-Lyne.—FEMALE LABOUR.—The T.C. has granted conductor's licences to 10 females engaged by the Oldham, Ashton and Hyde Electric Tramway Co., Ltd.

Australia.—ELECTRIFICATION OF THE SYDNEY NORTH SHORE LINE.—The tunnel from Long Nose Point to Balls Head is nearly completed, the flooding having been successfully overcome, and it will be possible to lay the cables in a few weeks. At White Bay power house, machinery capable of developing 30,000 H.P. has been installed, and there is room for a further 60,000 H.P., or 90,000 H.P. in all, which is sufficient for the electrification of the whole of the suburban lines. It is estimated that the North Shore system can be electrified for £300,000; it is also considered that the White Bay power house should be utilised at the earliest possible moment for this railway, and that the building of the new electric railway stock should be commenced at once in order to be ready for the conversion of the suburban lines as soon as the power is available.—*Sun*.

SYDNEY CITY ELECTRIC RAILWAY.—The N.S.W. Minister for Public Works has intimated that the construction of the Sydney City Railway will be commenced in March. The plans specify that the overhead station at Circular Quay is to be moved nearer the Customs House, thus providing more room and involving the demolition of the Harbour Trust offices and the metropolitan fire station adjoining.

The Maryborough (Queensland) Council Tramways Committee has considered a report on the electric light and tramways questions, and has decided to pay Mr. E. J. Redmond £50 out of pocket expenses incurred in connection with his recent scheme. A further £50 was authorised to be spent in order to complete the information in connection with an up-to-date electric tramway system.—*Tenders*.

The Victorian Railway Commissioners are applying to Parliament for sanction to a loan of £800,000 towards the electrification of the Melbourne suburban lines, excluding the construction and

structural alteration of rolling stock, but including the electrical equipment; the amount is part of the £3,110,000 loan for railway purposes.—*Age*.

The annual report of the Prahran-Malvern Tramway Trust states that the total length of track operated was 27,387 miles double and 3,280 miles single, which would be shortly extended by the completion of the Burke Road tramway. The car depot and converter station at Kew were nearly completed, and would be available as soon as the battery was in position. In view of existing conditions and the increased cost of materials, it was recommended that no further extensions should be entertained until normal conditions prevailed. The gross revenue was £121,016, and the operating costs £110,493, leaving a surplus of £10,523, to which had to be added £3,168 for the loss on the Caulfield and Point Ormond extensions. The whole of the street lighting of the track was provided by the Trust, at a cost of £3,336. The balance to the credit of renewals, reserves, and sinking fund was £30,966, and the capital expenditure was £264,599. The number of passengers carried during the year was 18,350,503. The receipts on the Caulfield line were £7,226, and the expenses £10,894, leaving a loss of £2,942 to be repaid by Caulfield and £226 by St. Kilda. The transfer to reserve, sinking and loan funds amounted to £11,250, leaving a balance of £1,190 available for distribution as follows:—Prahran, £1,181; Melbourne, £9. During the year £1,050 has been paid to employers who had enlisted with H.M. Forces.

Bingley.—TRAMWAY EXTENSIONS.—The B. of T. has extended by two years, up to February 7th, 1918, the period allowed for the completion of the Bingley tramway past the Ryehworth Hall corner at Cross-fists.

Blackpool.—TRAFFIC RECEIPTS.—The tramway figures for the month ending January 13th show receipts of £3,322, an increase of £497 over the corresponding period of last year, and passengers carried 758,418, an increase of 105,900. The receipts from the commencement of the municipal year amounted to £70,727, an increase of £2,136 over the corresponding period of the preceding year.

Bradford.—TRAMWAY COLLISION.—An accident occurred on the Thornbury section of the Corporation tramways on Thursday morning, last week, when an outward bound Bradford to Leeds car took the wrong points at a crossover road near the Thornbury tram sheds and crashed into a Leeds Corporation car proceeding to Bradford. Nine persons complained of injuries, the most serious cases being removed to the Royal Infirmary.

Continental.—SPAIN.—A scheme has been lodged at the Prefecture of Public Works, at Santander, for the construction of an electric tramway linking the seaside resort of Sardinero with those at Cabo Mayor and Cabo Mener. The line, which will have three branches, will have a total length of 3,618 m.

ITALY.—As far back as April 14th, 1914, the Consiglio Comunale of Spezia decided to exercise its legal right and take over the tramways owned by the Società Tranvie Elettriche della Spezia. Differences of opinion, however, existed between the company and the Comune as to the amount to be paid as compensation and for the plant, 2,469,130 lire and 4,500,000 lire representing the purchaser's and the seller's estimates respectively. The matter is now to be referred to arbitration for settlement.

In view of the near lapse of the concession enjoyed by the Società Romana Tramways-Omnibus, the Administration of the Municipal Tramways is drafting a broad scheme of tramway extensions and street improvements conjointly, which is to be undertaken when the whole of the city's network is under municipal control. Ten new lines are to be carried out and the Administration intends to "unfold a plan of underground tramway lines of moderate depth which will represent an intermediary stage between the existing aboveground network and the deep 'tube' line of the future, which must be constructed when the population of the city amounts to 1,000,000." The provisional moderate depth underground lines are, it is stated, an actual necessity, owing to the daily growing congestion of traffic in the streets of the city. The 10 new lines projected are to be constructed gradually, preference being given to radial trunk lines and the most active traffic routes. The total length of the new lines projected is upwards of 2,127 km.—*Revista Tecnica d' Elettricita*.

Croydon.—FEMALE LABOUR.—The B.C. has authorised premises being rented to provide messroom and waiting accommodation for women conductors, of whom nine are being trained. It is reported that the receipts to date exceed by £5,332 those of the corresponding period of last year. The Committee has considered the suggestion of the Croydon Chamber of Commerce that a parcels delivery service should be tried but, owing to shortage of labour, did not consider it advisable or practicable.

Dover.—The T.C. has appointed a Sub-Committee to consider the question of women conductors, and to take the whole question of the tramways into consideration. The aggregate revenue of the undertaking from April 1st last amounts to £12,944, as compared with £10,730 for the corresponding period of the previous year.

Dudley.—INQUEST.—The inquest relative to the death of J. T. Evans, which resulted from injuries received in the tramway accident mentioned last week, was opened on Thursday, last week. After evidence of identification, the inquiry was adjourned to February 3rd.

Ealing.—Owing to the bursting of a water main on Sunday, between Ealing Station and the Broadway, considerable damage was done to the roadway, causing the London United Tramway service to be suspended.

Edinburgh.—The Tramways Committee of the T.C. recommends the provision of a motor for driving certain machinery at Shrubhill power station, at an estimated cost of £160.

London.—The traffic receipts of the L.C.C. tramways during the five weeks ended January 12th, 1916, amounted to £228,425, and the number of passengers carried to 54,291,778; for the corresponding period of 1914-15 the receipts were £221,174, and the passengers carried 52,860,313, showing an increase of £6,251 in the receipts, and 1,431,465 in the number of passengers carried.

SOUTH-WESTERN ELECTRIFICATION.—The difficulty which prevented the electric train service on the Waterloo to Kingston, Richmond, and Shepperton lines, on the L. and S.W. Railway, from being inaugurated on December 3th has now been overcome, and it is officially announced that the service will commence on Sunday, January 30th.

Manchester.—**Trolley Boys Strike.**—The tramway department has recently experienced a shortage of boy labour, and, by way of experiment, four girls have been engaged as "trolley-girls." The trolley boys, being under the impression that the girls were receiving better pay than they were, went on strike at noon on Friday last week, their "demand" being that they should have an advance. Mr. J. M. McElroy, general manager, stated that he had received no application from the boys for an advance of wages. The trolley girls, he added, were being paid on exactly the same scale as the trolley boys. Ald. Jackson, of Salford, general secretary of the Tramway Workers' Union, said the boys could not to have taken the law into their own hands, and his Union could not sanction such action as they had adopted. The trolley boys returned to work on Saturday. Altogether about 350 trolley boys are employed on the tramway system.

TELEGRAPH and TELEPHONE NOTES.

Argentina.—A concession for the installation of a new public telephone service at Buenos Ayres has been granted by the Municipal Commission of the City to Senor Alex. Schwimmer. The system is intended to provide news and telephonic service, and the concession lasts 30 or 50 years; the concessionaire will pay 6 per cent. of his gross receipts during 30 years, and 12 per cent. during the remainder of the term, to the municipality, with a fixed minimum annual payment of 50,000 Mexican dollars, and the maximum price per subscriber's station is fixed at \$10 per month.

New Wireless System.—It is reported from Madrid that a new wireless telegraph system will be put in operation between Corunna and New York from February 1st. The system has been invented by Senor Branas, Professor of Oviedo University.

Russia and Rumania.—The Great Northern Telegraph Co., of Denmark, announces that an urgent service with Russia and Rumania has been introduced. The word "Urgent" must be inserted before the address and be paid for. The rate is triple ordinary rate—viz., to Russia 1s. 1d., and to Rumania 1s. 3d. Urgent telegrams will receive priority of treatment over other private telegrams.

Week-End Messages to Australasia.—The Pacific Cable Board announces that during the suspension of week-end messages between the United Kingdom and Australasia (owing to interruptions on the Atlantic Cable system), messages will be accepted for transmission by post to Montreal and telegraphed from thence to destination, at the rate for week-end messages from Montreal to Australasia. Telegrams sent by this service will probably reach their destination in about 12 to 16 days, the period depending on the mail service between this country and Montreal, and may be posted to the Pacific Cable Board, Queen Anne's Chambers, London, S.W., together with remittance covering the cost at the following rates:—To Australia, 20 words, minimum charge, 11s. 8d.; each additional word, 7d. To New Zealand, Norfolk Island and Suva (Fiji), 20 words, minimum charge, 10s.; each additional word, 6d.

Messages must be prefixed P.W.T., which is counted and charged for as one word. These telegrams may also be handed in or posted to any of the offices of the Western Union Telegraph Cable system.

An arrangement is already in force in Australia and New Zealand for the acceptance of week-end messages to be telegraphed to Montreal, and posted thence to their destination in the United Kingdom.

Women Wireless Telegraphists.—A woman correspondent of the *Times* recently discussed the opportunities open to women to obtain employment in connection with wireless telegraphy. Already women are working on stations in the British Dominions and the United States, and the British Government has placed women in charge of stations at Rathlyn Island and the Isle of Mull; it is stated that the work is well within the compass of women, who make apt students and readily acquire the technical knowledge necessary to enable them to perform the duties of the wireless telegraphist.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—February 18th. Melbourne, Brunswick and Coburg Tramways Trust. Six radial trucks.*

April 15th. P.M.G. Common-battery multiple switchboard, or automatic or semi-automatic switchboard, and associated apparatus. See "Official Notices" December 31st.

BRISBANE.—February 28th. Deputy P.M.G. Gas engine, generator, battery, power board, &c., for the Post Office, Townsville, Queensland. (Schedule No. 370.) High Commissioner's Office, 72, Victoria Street, S.W.

April 26th. Deputy P.M.G. Five sections of trunk line switchboard for Toowoomba Exchange. (Schedule No. 342.)

MELBOURNE.—February 16th: 51 electric staff instruments. February 23rd: Two commutator slotting machines, for the Victorian Railway Commissioners.*

February 2nd. Agent-General for Victoria. Free distribution boxes and fuses, for the Victorian State Railways. See "Official Notices" January 14th.

March 22nd. Thermo-electric pyrometers, for the Victorian Government Railway Commissioners.*

SYDNEY.—February 7th. Metropolitan Board of Water Supply and Sewerage. For No. 1 pumping station at Ultimo. Two centrifugal pumps and electric motors (4,000 gallons per minute each), switchboards, starters, &c. Contract No. 1,301.*

February 28th. Municipal Council. Tenders for induction regulators. Specifications (11s. 6d.) from the Electric Light Department, Town Hall, Sydney.

April 10th. Municipal Council. Supply, laying and maintenance for six months of six 11,000-volt submarine cables, each 400 yards long, across Darling Harbour.*

May 3rd. N.S.W. Railways and Tramways Department. One 2,500-kw. turbo-alternator, for Zara Street, Newcastle, power house. Specifications (20s.) from the Engineer's office, 61, Hunter Street, Sydney.

Birmingham.—February 8th. Twelve months' supply of electrical stores, for the Birmingham Tame and Rea District Drainage Board. Forms of tender from the Board's offices, Tyburn, Birmingham.

Great Yarmouth.—February 1st. Corporation. Three, six or twelve months' supply of tramway stores. Specification from Mr. F. L. Turner, General Manager, Tramway Offices, Caister Road.

Halifax.—February 14th. Corporation. Twelve months' supply of electric lighting fittings and accessories, cables, telephone wire, meters, &c. See "Official Notices" January 21st.

Leicester.—February 5th. Corporation. Thirty tons 7-in. steel girder tramway rails, for the Tramways Committee. Particulars from Mr. E. G. Mawbey, Borough Engineer, Town Hall.

Leigh (Lancs.).—February 18th. Electricity Committee. 2,000-kw. turbo-alternator, 6,600 volts; surface condenser, set of pumps, 1,000 kw. rotary or motor-converter, with switchgear. See "Official Notices" to-day.

London.—BERMONDSEY.—February 10th. B. of G. Twelve months' supply of electric lamps. Forms of tender from Mr. E. Pitts Fenton, Clerk to the Guardians, 283, Tooley Street, S.E.

ISLINGTON.—February 17th. B. of G. Alteration to wiring, provision of switchboards, motor starters, &c., provision of motors, and purchase of old plant. See "Official Notices" to-day.

Manchester.—February 8th. Tramways Committee. Motor-bus engines and chassis. Mr. J. M. McElroy, General Manager.

February 15th. Corporation. General stores, including cables, telephones, electrical accessories, &c., for the Tramways Department. See "Official Notices" to-day.

Middlesbrough.—February 7th. Corporation. Twelve months' supply of electric lamps. Specification from Mr. S. E. Burgess, Borough Engineer.

New Zealand.—AUCKLAND.—February 23rd. City Council. Centrifugal pumping electric motors, and automatic starting and controlling apparatus, for the four city pumping stations. Specifications from the office of the Water Board, Town Hall, Auckland.

DUNEDIN.—May 17th. City Council. (1) Tramcar bodies; (2) electrical equipment. Plans, &c., from the Town Clerk, Dunedin.

RAETHIR.—March 14th. Town Board. 40-H.P. hydro-electric generating set and switchboard, &c. Plans and particulars from Messrs. H. W. Climie & Son, Raethir.*

WELLINGTON.—March 8th. Public Works Office. One 3,000 kw. generator and one 4,300-H.P. water turbine, at Lyttelton, for the Lake Coleridge electric power scheme. Specifications, &c., may be consulted by British firms at the office of the High Commissioner in London for New Zealand, at 13, Victoria Street, S.W.

Pembroke (Dublin).—February 7th. U.D.C. Twelve months' supply of electrical goods. Specifications from the Town Hall, Ball's Bridge, Co. Dublin.

Ross.—X-rays installation at the dispensary and cottage hospital. Superintendent.

Swansea.—February 7th. Electric light installation, Brynmill School, for the Borough Education Committee. Mr. A. W. Holden, Clerk, 9, Grove Place (returnable deposit of £1 1s.).

Wigan.—February 6th. Tramways Committee. Twelve months' supply of tramway stores, including overhead material, &c. Specifications from Mr. F. Buckley, General Manager, Corporation Tramways, Market Place.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Australia.—The following tenders have been accepted:—

P.M.G.'s DEPARTMENT, SYDNEY.

130 cable boxes, 25 pairs, £146; 73 ditto, 39 pairs, £81.—O. Dörbauer.

P.M.G.'s DEPARTMENT, SOUTH AUSTRALIA.

80 miles rubber-insulated copper wire, No. 18, L.S.W.G., £241; 25 miles, No. 22, £195; 3 miles cotton-covered flame-resisting wire, £30. W. T. Henley's Telegraph Works Co., Ltd.
60 miles twisted-pair, V.L.R., No. 20 copper wire, £1,158.—British General Electric Co., Ltd.

VICTORIAN RAILWAYS.

15-ton electric crane, including accessories and power derricking gear, £1,596.—Gibson, Battle & Co., Ltd.
60,000 flame arc carbons, £12 per 1,000.—Aust. Otis Engineering Co.
Electric lighting material for cars, at rates.—Aust. General Electric Co.
Two armature-banding machines, £340.—Gibson, Battle & Co.

—Tenders.

The Commonwealth P.M.G. has accepted the contract of the Commonwealth Art Pottery and Insulator Co. for the supply of 400,000 B insulators, to be delivered at the rate of 34,600 per month.—*Sydney Daily Telegraph*.

Cape Town.—Tenders were recently invited locally and in England for X-ray apparatus proposed to be installed at the new Somerset Hospital as a memorial to the late Sir Alfred Thompson, M.D. The tenders were submitted to Dr. Reynolds, the radiographer to the hospital, and on his advice the committee has accepted the tender of the British General Electric Co., Ltd., of Cape Town, at £386. The tender includes delivery and erection at the hospital and maintenance for three months.

The contract secured by Messrs. Sykes & Co., and mentioned in our last issue, was secured on behalf of Messrs. Bruce Peebles and Co., Ltd. It was for a Peebles motor-converter manufactured under the Peebles-La Cour patents, not a rotary converter. The Cape Town Corporation already has two 1,000 KW. Peebles motor-converters installed, and the present order is for a third of similar output.

East Ham.—The Electricity Committee has accepted the offer of Messrs. E. & A. Shadrack to supply 100 tons of Sherwood 1-in. nutty slack, at 22s. 3d. per ton, and 100 tons of Glasbrook best Admiralty smokeless Welsh coal, at 31s. per ton.

London.—ST. PANCRAS.—The Electricity and Public Lighting Committee has recommended the following tenders in connection with the extension of the King's Road generating station:—Concrete coal-bunkers and lift well: Messrs. W. King and Son, £2,764. Steel construction work: Messrs. E. C. & J. Keay, £7,615. Coal and ash-handling plant: Messrs. Strachan and Henshaw, £3,660.

LONDON.—The Lighting Committee has communicated with contractors where, in its opinion, it would be in the Council's interest that existing contracts should be continued for a further period of 12 months, with a view to ascertaining which contractors would be willing to agree thereto. The only firm who are prepared to meet the Council in this respect, so far as contracts relating to the electricity department are concerned, are Messrs. Wm. Geipel and Co., who supply arc lamp carbons. The Council has been recommended accordingly.

New Zealand.—The Public Service Stores Tender Board, Wellington, has received the following tenders for 10,000 dry cells for telephones:—

Electric Construction Co.	(accepted)	£741
A. & T. Burt		54
F. W. Markman		598
P. R. Baillie & Co.	(for 5,000 only)	578
A. Ellis & Co., Ltd.		419
D. Riley & Co., Ltd.		625
Ramsay, Sharp & Co., Ltd.		706
		663
		750

The following tenders were also received for 1,000 yards of silk-covered cable, 33 wires; 2,000 yards of silk and cotton-covered cable, 66 pairs, and 2,000 yards ditto, 64 wires:—

Turnbull & Jones	(accepted)	£253
British General Electric Co.		584
A. D. Riley & Co., Ltd.		631
P. R. Baillie & Co.		688

—New Zealand Shipping and Commerce.

Walthamstow.—The tender of Messrs. W. T. Henley's Telegraph Works Co., Ltd., has been accepted by the U.D.C. for the supply of low-tension cables.

FORTHCOMING EVENTS.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, January 28th. At 7.30 p.m. At Bolls Hall, Newcastle-on-Tyne. Ordinary general meeting.

Association of Mining and Electrical Engineers. Notts and Derbyshire Branch. Saturday, January 29th. At 8 p.m. At J. J. Gower, Nottingham. Paper on "Universal Break-down in Colliery Electrical Plants" by Mr. R. Davine, and "Notes on Experiment with Batteries signalling Heli-following the Bechthold Explosion," by Mr. G. M. Harney.

Röntgen Society. Tuesday, February 1st. At 8.15 p.m. At the Institution of Electrical Engineers, Victoria Embankment, W.C. Discussion on "The Injurious Effects produced by X-rays," to be opened by Dr. Selwyn Ross.

Institution of Electrical Engineers (Students' Section). Wednesday, February 2nd. At Victoria Embankment, W.C. Paper on "The Methods employed for the Wireless Communication of Speech," by Mr. E. R. Courses.

Chemical Society.—Thursday, February 3rd. At 8 p.m. At Burlington House, Piccadilly, W. Lecture on "The Recent Work on X-rays and Crystals and its Bearing on Chemistry," by Prof. W. H. Bragg, F.R.S.

Royal Institution of Great Britain.—Thursday, February 3rd. At 8 p.m. At Albemarle Street, Piccadilly, W. Lecture on "Industrial Applications of Gaseous Fuels derived from Coal," by Prof. W. A. Rone, F.R.S.

Greenock Electrical Society.—Friday, February 4th. At 7.45 p.m. At the Temperance Institute, 19, West Hoad Road, Greenock. Paper on "Colliery Electrical Installations," by Mr. R. Gordon Campbell.

West of Scotland Iron and Steel Institute.—Friday, February 4th. At 7.30 p.m. At the Rindie Hall, Eglinton Crescent, Glasgow. Paper on "The Manufacture of Ammonium Nitrate, &c., from Waste Gases," by Mr. E. Kilburn Scott.

NOTES.

Diesel Engine Users' Association.—At the January meeting of the above Association, the use of tars and tar oils as fuel for Diesel engines was discussed. Mr. Charles Day, of Messrs. Mirrlees, Bickerton & Day, had been specially invited to attend this meeting, and, after referring to the recent very great increase in the price of fuel oil, he said that tars and tar oils had been successfully used on the Continent, the ignition difficulties having been completely overcome by injecting a small quantity of petroleum oil into the cylinder of the engine slightly in advance of the tar oil.

Mr. Day estimated that the cost of carrying out the necessary alterations to engines manufactured by his firm for adapting them to the use of tar oils, including a new needle valve casing, ignition pump, and device for controlling the pump, would be in the neighbourhood of £1 per H.P., and, taking petroleum oil and tar oils at present prices, the cost of this alteration would be paid for in the first year by the saving effected in the cost of fuel oil on an engine working for the average number of hours per annum. He had run Diesel engines quite successfully on whale oil.

On the invitation of the President to give some information on the subject of the crosshead type of Diesel engine being made by Messrs. Mirrlees, Bickerton & Day, Ltd., Mr. Day explained that its advantages, as compared with the trunk piston type, were, in the first place, the greatly reduced risk of piston seizure, due to the fact that the piston need not be such a close fit, as the transverse forces due to connecting-rod angularity were taken on the crosshead, and not on the piston. There was also reduced risk of piston cracking, and it was possible to give much better support in the crosshead type than in the trunk type to the centre of the piston, which was exposed to the greatest heat and to the maximum stress. Trouble with the connecting-rod top end would also be reduced, since this bearing was in a position quite away from the heat of the piston. To secure that the piston-rod should be kept cool, and to prevent any oil vapour rising from the crank chambers to the cylinders, or any smoke or dirty oil passing into the crank chamber, a cover was fitted between the cylinder and the crank chamber, with a water-cooled gland, which prevented transmission of heat to the crosshead. A further advantage was greater economy in lubricating oil, as any carbon or dirty oil was prevented from entering the crank chamber from the cylinders; the lubricating oil therefore retained its condition longer, not being splashed or thrown on to the cylinder walls, and was kept much cooler, and none of it being lost through the cylinders, a substantial saving would obviously result. The air on its way to the cylinders was arranged first to go underneath the pistons, so that any smoke or gas which had passed the pistons would be thoroughly cleared away, and a considerable amount of air cooling would also take place. The water-cooled gland mentioned would have none of the disadvantages of a water-cooled piston, since it did not introduce any additional reciprocating weight, and its stationary water joints would not be liable to cause trouble. The piston need not be made so thick and heavy as the trunk piston, which was liable to cracking and distortion if its thickness or weight were further reduced.

The next meeting of the Association will be held on February 23rd.

Appointments Vacant.—Chief clerk (temporary), (50s.), for the Corporation of Swindon electricity and tramways department; test-room assistant and meter mechanic (45s.), for Borough of Newport (Mon.) electricity department; station engineers (60s.), linemen joiners (50s.), wiremen (40s.), engine drivers (steam, gas or oil) 30s., and wiremen's mates (30s.), for the Military Camps, Western Command. See our advertisement pages to-day.

Institution and Lecture Notes.—Association of Mining Electrical Engineers.—A joint meeting of the Scottish branches of this Association and the National Association of Colliery Managers, together with the Mining Institute of Scotland, was held at Glasgow on Saturday last. Prof. Daniel Burns, of the Royal Technical College, Glasgow, read a paper on "Electrical Shaft Winding," and said in general the wider application of central supply schemes and the electrical equipment of groups of mines must inevitably lead to a more extensive use of electrical winding, but even the most sanguine advocate of the use of electrical appliances about collieries must recognise that many large colliery concerns produced a large quantity of low-grade fuel from their coal-cleaning processes, which was almost unmarketable, and had to be used for steam-raising purposes at the colliery in order to get rid of it. The necessity of thus having to dispose of the residue of the coal washer must, and probably always would, exert a powerful influence on the cost of steam raising, and would provide in many cases a factor in favour of steam winders which was entirely outside the merits of the two systems. Prof. Burns, in conclusion, remarked that the employment of electricity for winding had now been perfected, and colliery owners need have no hesitation in adopting this type of electrical machinery when suitable conditions existed for its application.

From the foregoing report, extracted from the *Glasgow Herald*, it would seem that some colliery owners are content to use their boiler furnaces as refuse destructors in preference to employing the most efficient means of raising coal. The economic folly of this policy needs no demonstration. How to avoid it may be learned from a visit to the North-East Coast.

Institution of Electrical Engineers.—On Thursday last week a paper was read by Mr. H. H. Harrison on "The Principles of Modern Printing Telegraphy," and a discussion followed.

The same paper was read and discussed at a meeting of the MANCHESTER LOCAL SECTION on Tuesday last. The President of the Institution, Mr. C. P. Sparks, was present and addressed the members, expressing his pleasure at being there. He said that a good deal of agitation and correspondence in the Press had taken place on the subject of "Alien Enemies." The Institution had power to deal with this question under Article 41 if the matter was raised by 10 members, but the matter had not been raised by any 10 members. The Council, however, had appointed a Committee of vice-presidents to consider this matter, and would act within a very short time.

Dealing with the work of the Institution generally, he mentioned the Research Committee. Considerable sums had been set aside for it, with the approval of the members, and good work had been done. Recently, at the request of a Committee of the Privy Council, they presented a report naming nine subjects on which they considered research should be undertaken. Up to the present the Privy Council had only considered two of the nine subjects, and he was pleased to say that the Government had granted the sum of £1,050 per annum towards the cost of research on these subjects. There was no reason to think that the other seven subjects would not receive similar treatment.

The Wiring Rules Committee had completed its work, and he hoped the revised rules would be published within a few weeks.

Dealing with the question of examinations, the President said it was not the wish of the Council to keep out any desirable candidate. If a person could not pass examinations, but was otherwise qualified, and could pass other tests, he would be elected. During the war period the examinations were suspended, and those candidates who were on active service or engaged on munition work would be elected Associate Members at an early date. A hearty vote of thanks was accorded to the President for his address.

Fatality.—A boy while on his way to school at Nitehill, Renfrewshire, came into contact with a fallen live wire of the Clyde Valley Power Co. and was instantaneously killed.

Volunteer Notes.—**ENGINEERING INSTITUTIONS' VOLUNTEER ENGINEER CORPS.**—Orders for week commencing January 31st, 1916.—By Lieut.-Col. C. B. Clay, V.D., Commandant.

Drills, 6.25 to 7.25; 7.25 to 8.25 p.m.

Saturday, January 29th.—Uniform Parade, 2.45 p.m.

Monday, January 31st.—Sections 1 and 2, Technical; Sections 3 and 4, Lashings and Trestle Bridging, Signalling Class and Recruits.

Tuesday, February 1st.—School of Arms, 6 to 7 p.m.

Thursday, February 3rd.—Shooting for Sections 3 and 4.

Friday, February 4th.—Sections 3 and 4, Technical; Sections 1 and 2, Lashings and Trestle Bridging; Signalling Class and Recruits.

Saturday, February 5th.—Adjutant's Instruction Class at 2.30 p.m.

E. G. FLEMING,

Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON REGIMENT (VOLUNTEERS).—Battalion Orders by Colonel S. G. Grant (Officer Commanding), Thursday, January 27th, 1916.—

Week-end Parades.—**Saturday.**—The Battalion, less Platoons Nos. 6, 9 North London and Blackheath, will parade at Wembley Park at 3.15 p.m. All "Derby" recruits will parade with this party. The members of the Officers' Instruction Class will also parade at Wembley Park at 3.15 p.m., under the Battalion Serjt. Major.

Sunday.—The Battalion, less Platoons Shooting at Acton, will parade at the Low Level entrance, G.E.R., Liverpool Street Station, at 9.30 a.m., and will proceed by train for Extreming duties. Members will carry their own lunch. The Battalion will return to town about 6 p.m.

Musketry.—The Inter-Platoon Competition will be continued on Saturday next, the 29th inst., and on Sunday, the 30th inst., in accordance with the orders published on Monday last. The competing platoons to parade punctually, in uniform with bayonets, at the hours named in the before-mentioned orders.

A. G. JOINER, Major and Adjutant, O.B.C.

National Trade Policy.—In the House of Commons on Wednesday, Sir A. Spicer asked the Prime Minister whether the Government were prepared to appoint at once a number of small committees to undertake, for the leading industries of the country, inquiries similar to those recently made by the special sub-committee of the Advisory Committee on Commercial Intelligence of the Board of Trade, and to appoint upon the report of such committees a Royal Commission, representative of various schools of fiscal opinion and of the leading overseas Dominions and India, to make recommendations as to the commercial policy of this country consequent upon the war.

According to the *Daily Telegraph*, Mr. Runciman, who replied, said he proposed to arrange for inquiries similar to that in question to be taken shortly in a number of groups. He was not in a position to state what subsequent action would be taken.

In reply to a request from Sir Philip Magnus for delay, Mr. Runciman said, "Some of these things cannot wait."

Educational.—**UNIVERSITY COLLEGE, LONDON.**—Owing to circumstances arising out of the war, Mr. Kilburn's Scott's course on the "Electrical Production of Nitrates for Fertilisers and Explosives," announced to begin on Wednesday, January 26th, will not be held.

Patents and Alien Enemies.—The Worthington Pump Co., Ltd., has applied to the Board of Trade for the avoidance or suspension of Patent No. 19,609/10, granted to Meyer, in respect of valves for pumps.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—The East Ham Tramways Committee propose to increase the salary of Mr. T. C. WINGFIELD, works-superintendent, from £250 to £275 per annum.

The Luton T.C. has been recommended to increase the salary of the electrical engineer's chief clerk, Mr. R. HARDING, from £130 to £143 per annum.

The Poplar B.C. has been recommended to increase the salaries of the following officers of the electricity department as from January 1st:—Mr. F. TAIT, assistant manager, £275 to £287 10s.; Mr. V. H. CRICKSHANK, station engineer, £250 to £262 10s.; Mr. E. R. INGRAM, mains engineer, £250 to £262 10s.; Mr. E. E. FARRANCE, sales manager, £237 10s. to £250; Mr. A. H. VINCENT, junior clerk, £71 10s. to £78; Mr. J. FORSYTH, charge engineer, £175 to £185; Mr. C. W. COPPINGER, charge engineer, and Mr. A. E. RICKETTS, sub-station engineer, £162 10s. to £185 each.

Mr. G. SCHOFIELD, late constructional superintendent of West Ham Corporation, has concluded his services with West Ham and taken the position of chief assistant engineer to the Nairobi Power & Lighting Co., Nairobi, East Africa. He sailed on the ss. *Comrie Castle*, which left Marseilles on January 25th.

General.—Mr. C. G. STANESBY, F.C.I.S., has been appointed secretary of the Charing Cross, West End & City Electricity Supply Co., Ltd., in succession to Mr. Edward Wilmut Scale, who has retired after 26 years' service.

The *London Gazette* contains the following notice:—**Territorial Force:** The London and Tyne Electrical and Mechanical Company. The announcement of the transfer of the undermentioned officers, which appeared in the *London Gazette* of December 1st, 1915, is cancelled:—Captain (temporary Major) Arthur E. Levin; Second-Lieutenant (temporary) Hugh C. C. Tufnell; Second-Lieutenant (temporary) Hugh C. C. Tufnell; Second-Lieutenant (temporary) Frederick H. Bowers.

Mr. G. A. MUNSALL, leading electrical fitter and machinery attendant on the staff of the L.C.C. Highways Committee at Rotherhithe tunnel and Deptford Creek bridge, has resigned.

Mr. W. H. WATSON, late of the staff of the electricity department of the Marylebone T.C., and formerly at Blackpool Corporation works, has obtained a commission in the R.N.V.R. He has been in the Anti-Aircraft Corps, and served for five months at the Dardanelles.

Mr. C. W. NAIT, borough electrical engineer at Torquay, who recently joined the London Corps of Electrical Engineers, has been promoted to the rank of corporal.

The electricians and other members of the engineering staff of Messrs. M. Oldroyd & Sons, Ltd., woollen manufacturers, of Bradford Road, Dewsbury, last week presented an illuminated address and gold watch to Mr. G. H. HARROP, on his

retirement after 32 years' service with the firm. Mr. Harrop has been chief engineer to the firm for 25 years.

In the absence of the President of the Royal Society of Arts, J. R. H. the Duke of Connaught and Strathearn, K.G., Dr. Dugald Clerk, F.R.S., Chairman of the Council, on Monday afternoon, at a meeting of the Council, presented the Society's Albert Medal to Prof. Sir J. J. Thomson, O.M., D.Sc., LL.D., F.R.S., "for his researches in chemistry and physics, and their application to the advancement of arts, manufactures, and commerce."

Mr. ERIC SMITH, who has just joined the Electrical Signalling Department, Cable Company, Canadian Contingent, was electrical engineer on the Santa Fé railway, and was at New Mexico, U.S.A., before coming home to join the Forces.

Mr. S. R. BORTH has been appointed to the staff of the Adelaide University, South Australia, as Lecturer on Accountancy. He has for some time been a Member of the Senate of the University.

Roll of Honour.—Mr. E. J. DUTCH, secretary to Messrs. H. J. Gash & Co., Ltd., electrical and heating engineers, of Westminster, who enlisted in the 2nd King Edward's Horse in August, 1914, and who was twice wounded in 1915, has now been discharged from hospital for the second time, and has been gazetted Second-Lieutenant in the 14th Royal Fusiliers.

Corporal W. J. BOLT, of the 8th Battalion South Staffs. Regiment, who has been killed in his dugout by a shell whilst asleep, was, until his enlistment, on the staff at the Ocker Hill electrical works, Tipton.

Corporal S. C. PARISH, of the Queen's Surrey Regiment, who was serving his articles at the Croydon Municipal electricity works when he enlisted, has been killed in action. He was 20 years of age.

Lance-Corporal GEO. NASH, of the 10th Battalion Gloucestershire Regiment, who has been killed in France by shell fire, was, prior to his enlistment in October, 1914, on the electrical staff at Norchard Colliery, Lydney.

Trooper OLIVER GOLDSMITH, of the Hampshire Yeomanry, who has died in hospital at Tidworth from septic poisoning set up by an accidental wound to the hand, was, prior to his enlistment last August, on the staff of Messrs. Cooper & Co., electrical engineers, of Bournemouth.

Mr. LEE, late tramway inspector at Colchester, who joined the Royal Army Medical Corps, has been awarded the French Military Medal for conspicuous service in the field. He had just spent a brief furlough at Colchester.

Sergeant-Major DAX HARTOP, who was employed as an electrical engineer in the testing room at the Hyde Road tramcar depot, Manchester, has been promoted to the rank of Second-Lieutenant in the 12th Loyal North Lancashire Regiment for zeal, devotion to duty, and bravery in the field.

Captain ARTHUR B. LAYTON, A.M.I.E.E., who has been gazetted temporary Lieut.-Colonel in the Prince of Wales's Volunteers (South Lancs. Regiment), has been electrical engineer and departmental manager for 13 years past to the firm of Messrs. Joseph Crosfield & Sons, Ltd., Warrington.

Private JONATHAN COOKSON, of the 1st Battalion Lancashire Fusiliers, who was formerly employed at the British Westinghouse Works, Trafford Park, has been wounded in the shoulder, but has now left hospital and returned to the front.

Sergeant J. BROMLEY, who has just been killed in action in France, was employed by Messrs. Ferranti, Ltd., before he enlisted.

Mr. WM. A. ELLIS, formerly of Northwich (Cheshire), and now an electrician in the Royal Navy, has been awarded the D.S.M.

Lance-Corporal R. BARBER, 1st Cheshire Field Company, Royal Engineers, who was, prior to his enlistment, on the staff of the electricity department of Lever Bros., Ltd., Port Sunlight, has been awarded the D.C.M. On January 15th he visited the works and was presented by Sir Wm. Lever with a gold watch as a memento of his being the first employee of the firm to win the D.C.M.

The County of London Electric Supply Co., Ltd., send us the following information regarding the doings of County men with the Forces:—Mr. H. A. MONTEITH, of the secretarial department, who had formerly been serving in France in the "Queen's Westminsters," has obtained a commission as Second-Lieutenant in the 3rd Dorsets. Mr. F. H. HOWELL, of the secretarial department, formerly a bombardier in the 7th County of London, R.F.A., has obtained a commission in the Royal Field Artillery. Mr. N. F. GADSTONE, after service in France, has obtained a commission as Second-Lieutenant in the 4th Essex.

Mr. SYDNEY A. KNIGHT, of the secretarial department, after service in France, has been gazetted Second-Lieutenant in the North Somerset Yeomanry. Mr. C. E. SCOTT, of the "Purves" local office, and serving in the 2nd Middlesex Regiment, has been promoted to Regimental Quartermaster-Sergeant, and is now a Second-class Warrant Officer. Mr. ALAN LEIGH, of the mains department, has been granted a commission as temporary Second-Lieutenant of the 14th Service Battalion East Surrey Regiment. The following employees in the mains department of the company have been killed in action, all of the 9th Battalion Buffs (East Kent): H. BEAZLEY, T. HYAM, and R. REEVES.

Obituary.—Mr. R. F. VENNER.—We regret to record the death, which occurred on Sunday morning last, at the age of 54 years, of Mr. R. F. Venner. The deceased gentleman had been unwell for some time, and his

death was not unexpected. Mr. Venner was a son of the late Captain Venner, and he was educated at Malvern College. He was one of the earliest students in the Hammond Electrical Engineering College, now Tinsley House, his course beginning there in 1883. He was subsequently with the Hammond Co., and about the year 1886 he took charge of an exhibit of Messrs. Shippey Bros. & Co., at Antwerp. From 1885 to 1897 he was in partnership with his life-long friend, Mr. A. M. Sillar, in the firm of Venner and Sillar. Later the business of Venner & Co., electrical engineers and agents, at Westminster, energetically pushing the sale of Chamberlain & Hookham meters and Venner time-switches, brought him into touch with large numbers of our readers. The abate of that business have been conducted by Mr. E. E. Sharp for several years, and he will continue to conduct them pending the making of new arrangements. Mr. Venner had in recent years been interested in electric signs and in electric heating and cooking apparatus. Failing health, however, interfered with his securing that measure of success which he once anticipated in the cooking apparatus field.

Mr. FREDK. JAMES JONES, of the Eastgate, Chester, in business as an electrician and electrical engineer, died on January 19th at the age of 55. He was a native of Dublin, and studied electrical engineering while in New Zealand. Nearly 30 years ago he commenced business at Chester. About three years ago he underwent an operation, and he had been ailing since that time. Mr. G. D. Jones (son) succeeds him in the business.

Wills.—The late Mr. ALFRED BINNS, of Messrs. I. and A. Binns, Ltd., wire manufacturers, Halifax, left £13,101 gross and £9,032 net.

The *Times* states that MONTAGUE HAVES PETHWAY, R.N.A.S., of Hale, Cheshire, electrical engineer, who died in St. George's Military Hospital, Malta, on active service, left £10,944.

NEW COMPANIES REGISTERED.

F. R. Wade and Co., Ltd. (142,761).—This company was registered on January 19th, with a capital of £1,000 in £1 shares, to take over the business of F. R. Wade & Co., to carry on the business of engineers, manufacturers of electrical instruments and machinery, and to adopt an agreement with F. R. Wade, the subscribers with one share each are: F. R. Wade, 45, Colmore Row, Birmingham, consulting engineer; P. W. Wade, Wombly, Stoney Lane, Yardley, Birmingham, engineer. Private company. The number of directors is not to be more than five. F. R. Wade is the sole director. Solicitor: C. Jordan, Goldbach Buildings, New Street, Birmingham. Registered by Ordian & Sons, Ltd., 116-117, Chancery Lane, W.C.

General Engineering Co. (King's Cross), Ltd. (142,760).—This company was registered on January 19th, with a capital of £1,000 in £1 shares, to take over the business carried on at 97, Colindale Road, King's Cross, as the General Engineering Co. and/or A. V. Bond, to carry on the business of scientific and experimental engineers, model and tool makers, smiths, joiners, woodworkers, builders, electricians, electrical, hydraulic and gas engineers, etc. The subscribers with one share each are: A. V. Bond, 97, Colindale Road, King's Cross, N., engineer; H. C. H. Braun, 286, Pancrath Road, N., consulting engineer. Private company. The first directors are A. V. Bond and H. C. H. Braun. Qualifications (except first directors), £25. Registered office: 97, Colindale Road, King's Cross, N.

H. E. Jackson, Ltd. (142,778).—This company was registered on January 26th, with a capital of £2,500 in £1 shares, to take over the engineering business carried on at Churchgate, Leicester, as H. E. Jackson & Co. to carry on the business of tinsmiths, mechanical and electrical engineers, electricians, suppliers of electricity in light, heat, motive power, or otherwise, etc., and to adopt an agreement with H. E. Jackson, E. H. Kirk, and C. H. Kirk. The subscribers with one share each are: H. E. Jackson, 225, East Park Road, Leicester, mechanical engineer; E. H. Kirk, 106, St. Savian's Road East, Leicester, manufacturer; C. H. Kirk, High Barn, Leicestershire Road, Western Park, Leicester, manufacturer. Private company. The number of directors is not to be less than two or more than five; the first are H. E. Jackson (managing director), E. H. Kirk, and C. H. Kirk (all permanent). Solicitor: B. Wynn Edwards, 33, Friar Lane, Leicester. Registered by Jordan & Sons, Ltd., 116-117, Chancery Lane, W.C.

Shepherd's Parging Block Co., Ltd. (142,756).—This company was registered on January 18th, with a capital of £2,000 in £5 shares, to take over the business of a manufacturer of patent (patent) parging blocks carried on by W. Shepherd at Millstone, Rochdale, Lancs., as Shepherd's Parging Block Co., together with the benefit of certain existing inventions relating to improvements in connection with the laying of sets with respect to tramway lines or rails and blocks or sections used in connecting them. The subscribers (with one share each) are: W. Shepherd, Sporthcliffe, Manchester Road, Rochdale, road contractor; Mr. R. Shepherd, Sporthcliffe, Manchester Road, Rochdale; E. Shepherd, 14, Exeter Street, Rochdale, contractor; H. Shepherd, 36, Hare Street, Rochdale, contractor. Private company. W. Shepherd is the director, subject to the holding of the ordinary share capital. Registered office: Exeter Street, Millstone, Rochdale.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Muirhead and Co., Ltd. (82,270).—Capital, £50,000 in £10 shares. Balance sheet 31.12.15: £10,115. 3,382 shares taken up, £10 per share called up on 382; £3,820 paid, £30,000 considered as paid on 3,800 shares. Mortgages and charges: £13,500.

Larne Electric Light Works, Ltd. (46,982).—Capital, £4,000 in £1 shares (500 5 per cent cum. pref.). Return 1st November 24th, 1915: All shares taken up; £500 paid on the pref.; £3,500 considered as paid on the ord. Mortgages and charges: £2,700.

Enfield Electric Cable Manufacturing Co., Ltd.—Mortgage on certain freehold land at Brimsdown, Enfield, with factory and other buildings, the road, 31st.12.15: £10,000. Balance sheet 31st.12.15: £10,000. Income due from the company to Enfield County & Westminster Bank, Ltd., not exceeding £10,000.

David Anderson and Co., Ltd.—Issue on January 10th, 1916, of £2,200 debentures, part of a series of which particulars have already been filed.

Keynsham Electric Light and Power Co., Ltd.—A memorandum of satisfaction in full on December 31st, 1915, of third debentures dated December 24th, 1913, securing £1,000, has been filed.

City of Oxford Electric Tramways, Ltd.—A memorandum of satisfaction to the extent of £1,100 on December 17th, 1915, of charge dated February 20th, 1914, securing £46,000, has been filed.

North Wales Power and Traction Co., Ltd.—Particulars of £30,000 debentures, created by resolutions of January 31st, 1912, June 19th, 1913, and June 30th, 1915, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1906, amount of the present issue being £9,000. Property charged: The company's undertaking and property, present and future, including uncalled capital, subject to prior charges. No trustees.

Barbados Electric Supply Corporation, Ltd. (104,367).—Capital, £60,000 in 40,000 pref. and participating and 20,000 ord. shares of £1 each. Return dated November 11th, 1915. 35,173 pref. and 20,000 ord. shares taken up; £34,672 paid on 34,672 pref.; £20,500 considered as paid on 20,000 ord. and 500 pref. Mortgages and charges: £12,500.

Blackpool and Garstang Electric Light Railway Co., Ltd. (62,150).—Capital, £10,000 in £5 shares. Return dated December 31st, 1915. 361 shares taken up; £4 per share called up; £1,707 paid (including £333 received on application for further shares not allotted), leaving £60 calls unpaid on mortgages and charges: Nil.

Amazon Telegraph Co., Ltd. (44,532).—Capital, £250,000 in £10 shares. Return dated November 30th, 1915. All shares taken up; £250,000 paid. Mortgages and charges: £272,900.

CITY NOTES.

Yorkshire (West Riding) Electric Tramways Co., Ltd.

SIR H. S. LEON presided on January 21st, at 31, Throgmorton Street, E.C., over the annual meeting. He said the revenue for the year amounted to £81,086, against £69,768 in the previous year, but the working expenses were £3,474 more, which equalled a percentage of 10.7 over those of 1914. The percentage of expenses to receipts was 44.25, against 43.72—an increase of .53 per cent. Compared on a car mileage unit basis, the working expenses in 1914 were 4.373d. per car mile, but in 1915 they rose to 4.882d., an increase of a little over 1d. After deducting the working expenses from the gross receipts they had a balance of £45,208, being equal to 55.75 of the gross receipts. The income per car mile was 10.01d. in 1914, and 11.034d. in 1915. The tramway revenue had grown steadily, being £38,051 in 1905, and £81,086 in 1915. The increase in gross income for the year of nearly £7,000 was quite satisfactory, and, so far as they could see, was not due to war conditions and there was no doubt that they were reaping some of the fruits of the good seed sown in the past. The general increase in expense, however, must be seriously borne in mind, and to what extent it was likely to be permanent he could not say. Under the present abnormal conditions an increase of 11.7 per cent. was not excessive, particularly as they had to pay so much more for wages and for all necessary supplies. As an instance, he might mention that they were now paying 14s. 6d. a ton, instead of 8s. 6d., for a class of coal little, if any, better, and this item alone meant an increase of £2,000. As a result of the year's trading, £45,208 was carried to the net revenue account, and after deducting debenture interest, etc., £29,310 was carried to the appropriation account. To this, £10,725 brought forward from the previous year had to be added, giving a total of £40,035. The board had dealt with this by paying a dividend of 6 per cent. on the cumulative preference shares, which absorbed £12,027; setting aside £5,511 to the depreciation and renewals fund; crediting £2,000 to the insurance fund; by writing off 4450 preference shares set aside for the Wood's accident claim; by placing £5,000 to the general reserve fund; and carrying £15,045 forward. He had before fully explained the policy of the board with regard to the substitution of granite setts for the soft granite stone setts, and a considerable amount of the work yet remained to be done as soon as they could get the labour and materials. It had been found necessary to renew the battery at their Castleford power station, and they availed themselves of the opportunity to install a larger one, and had entered into a maintenance agreement with the manufacturers by which 100 per cent. efficiency was guaranteed for ten years. Their capital expenditure was £783,425, £769,810 of which had been expended on lines open for traffic and £13,196 on the Pontefract lighting. They commenced the supply about a month before the war broke out, and there was every prospect of their building up a very good business. The results, even under the present unfavourable conditions, were quite encouraging. No one could say what the conditions in the district they served would be after the war, and the board felt that they must regulate their affairs with due regard to future contingencies. If they were to maintain and improve their services a considerable sum of money must be spent, and the policy of the board was to collect as much money as possible, so that at the earliest date they might be in a position to begin the work and pay cash for it. In the past their relations with the local authorities had been of a most amicable character, but during the past year some of the local councils had pressed them to make considerable modifications in the fares. The general manager and himself saw one of the boards and pointed out the impracticability and financial unsoundness of the requests, and

now the local authorities were taking a sort of revenge by raising the road maintenance question. However, the company did not take offence at that, and had met the authorities very reasonably, and it was possible that in due course they would recognise that the company were justified in refusing to lower the fares. Last year he promised that the board would consider if any scheme could be formulated for dealing with the arrears on the 6 per cent. cumulative preference shares, and they had done so, and he hoped a scheme would be prepared when they felt justified in placing one before the shareholders. That moment, however, had not yet arisen. It would be a deplorable thing to put forward a scheme which would be acceptable to the shareholders and then to find that, owing to circumstances entirely beyond their control, they were unable to fulfil the obligations incurred. He asked for the forbearance of the shareholders until the country returned to more normal conditions. In conclusion, the CHAIRMAN referred to the admirable work done by Mr. H. England and the staff.

Mr. G. E. LEON seconded the motion.

Mr. DAVENPORT asked the board if they would accept a resolution to invite Dr. Moody and Mr. Lock to confer with them in regard to dealing with the arrears on the cumulative preference shares, but the CHAIRMAN intimated that he was not prepared to do so, and Mr. DAVENPORT proposed as an amendment that a committee, consisting of Dr. Moody and Mr. Lock, be appointed to meet the board.

After some discussion the amendment was not pressed, and the resolution was carried.

London Underground Railway Meetings.

ON Friday last extraordinary general meetings were held by the Metropolitan District Railway Co., the London Electric Railway Co., the City & South London Railway Co., the Central London Railway Co., and the London General Omnibus Co., at which resolutions were passed sanctioning an agreement between these companies with respect to the application of their receipts and the payment into a common fund of the half-yearly balances after meeting expenses. The Chairman, Lord George Hamilton, said that the agreement was made in pursuance of an Act passed last year. The five companies will afford to each other all reasonable facilities for through passenger traffic, through bookings, through fares, and interchange of traffic. In 1914 the five companies carried 819 million passengers, only 42 millions of whom were through passengers between the systems concerned. The new arrangement would lead to a simple and effective system of through or interchange tickets.

Companies Struck off the Register.—The following have been struck off the register, and are accordingly dissolved:—

Baldwins Fuelless Engine Syndicate,
Baldleigh Salterton Electric Light & Power Co.,
Economic Coaling Appliance Co.,
Emmatt Engineering Co.,
Power Syndicate of South America,
Russian Wireless Telegraph Trust,
Telenevics,
Vacuum Electric and Gas Heating Appliances,
Walker Reversible Turbine Co.

St. James' and Pall Mall Electric Light Co., Ltd.—The directors recommend a balance dividend of 3s. 6d. per share on the 7 per cent. preference shares for the half-year to December 31st, and 4s. 6d. per share on the ordinary, making, with the interim dividend, 8 per cent. for the year, as compared with 10 per cent. for 1914.

Australia.—The Kempsey Electric Light and Power Co., Ltd., in December advertised a prospectus in the Sydney newspapers offering 8,500 £1 shares for issue. The company was to take over the rights, etc. of Kynoch, Ltd., of Sydney, to supply electricity for public and private lighting in Kempsey.

Westminster Electric Supply Corporation, Ltd.—The directors recommend a dividend at the rate of 8 per cent. per annum, less tax, for the half-year ended December 31st (making 7 per cent. for year, as against 9 per cent. for 1914).

STOCKS AND SHARES.

TUESDAY EVENING.

The main interest in Stock Exchange markets is still confined to rubber shares. In that market, the volume of business has taken on a fresh lense of activity; and those people who are intimately connected with it find all their energies taxed to deal with the business that has sprung up. Some part of it, at all events, is mere speculation, in spite of the Treasury regulations to the contrary. The activity has developed into something of a gamble; and, as always happens in such cases, the strength of prices in good companies has brought to light various concerns of doubtful reputation.

The working man spends his money—or so, at least, we are told—upon cheap pianos, amusements, jewellery, furs, putting his war wages into these illusory investments; while the people of a different rank who, especially in the Midlands and

Northern Counties, are making big profits out of the war, are spending their wealth in the purchase of rubber shares, which they can at least justify by the expectation that good dividends will accrue thereon, but which every broker knows are bought in numbers of cases with a view to quick appreciation in capital value.

Meanwhile, the application for Exchequer Bonds goes on steadily, though not to an extent which might reasonably be expected by those who have means for seeing what large amounts are being expended in the purchase of the shares named above. The investment markets remain overshadowed by the Exchequer issue, for the chasing of the lists in which no date has yet been officially announced. In the circumstances, it is surprising to find Consols improving; but it is a pleasant surprise, since improvement in Consols spells firmness for all gilt-edged securities, extending beyond debenture stocks to the good-class preference shares in industrial companies.

The electric lighting dividends will be making their appearance before long and there is speculation in the market as to how these will materialise. It is thought that the County of London will maintain its previous distribution, and that the City will follow suit—or, at any rate, make but a small cut in its dividend. But as regards the West End undertakings less certainty is felt; indeed, there are some who think that reduction of one to two per cent. is almost inevitable, in view of the conditions under which the industry has worked during the past six months.

It is pointed out that the fatalities caused by the darkening of London's lights are greater than those which might have been brought about by Zeppelins—a matter of mere speculation, of course; though, having regard to the practical certainty that the Zeppelins would not come in mid-winter, there is point about the complaints which have been raised with reference to the official attitude on the subject. The batch of electric dividend announcements is awaited with a much more general interest than ordinarily—not only by shareholders in these companies, but also by those who have been, and are, hampered and inconvenienced by the lighting restrictions. Chelsea 4 per cent. debenture stock is a little lower, but otherwise there are no changes in the list of quotations this week.

The news from Mexico is read as being unfavourable, and once more there are small falls in the principal bonds of companies working in the country. The reports of American citizens having been murdered gave rise to the assurance that President Wilson would have more work to do in the dictation of notes as dignified as they are vain. Nobody supposes that the United States will trouble about the lives of a few citizens while those of so many thousands of others are being spent in the glorious pursuit of dollars that flow in so readily from the belligerent European countries.

Brazilian Tractions have recovered further; and the market seems to be a better one than it has been for some time past, although the rate of exchange has not helped matters appreciably. Reinsurance with reference to the dividend has stiffened the price more than anything else; and a few buying orders which came in at low figures found the supply of shares on offer was quickly exhausted.

The Telegraph market shows more changes. Western Telegraphs have risen again, and now stand highest of the trio in which they, with the two Eastern Extensions, command respectful attention from the investor. Eastern Extensions are a shade up. Small rises have occurred in Anglo-American Telegraph stocks. Cuban Submarine preference have been rather pressed for sale, and at 14½ show 10s. fall.

In the Telephone department, New York Telephone 4½ per cents. are wanted by the Government at 100½. Sales that are made to the Treasury in connection with the mobilisation scheme are done free of commission, through a broker, the Treasury paying the charges—which, by the way, are half those which the Stock Exchange Committee officially permits its members to make. Chili Telephones are ½ down at 6½; and United River Plates have eased off to 5½. Some of the 4 per cent. debenture stocks in this department are lowered to 79, at which the return on the money is about £5 1s. per cent.

Balcock & Wilcox have risen 5s. to 2 11/16, on persistent buying based upon reports that the company is making excellent progress, and that it will have big profits to divide, after making allowance for the excess tax and all possible reserves. British Westinghouse preference have gone back. The dividend in their case is due very soon. Last year 3s. was paid—that is to say, 7½ per cent., the shares being of the nominal value of £2 each. It is expected that they will get 10 per cent. this year. Edison & Swan fell 1s. to 7s. 6d.; but Electric Construction continue to creep up, and are again 6d. to the good at 15s.

Marconis are a slightly duller market, and interest has again subsided for the time being. The American shares, which rose to 18s. 6d., reacted to 17s. on a general fall of securities in America, due mainly to the difficulties in Mexico. Canadian Marconis, after touching 7s. 9d., lost the pence; and the activity that was stirred lasted but a few days.

Rubber shares are holding their prices with marked tenacity; and although the quotation for the raw stuff gives no particular indication of rising again to 4s. 3d., at which it stood a fortnight ago, the reports and dividends now being published are sufficiently good to keep alive interest and to encourage fresh buying in this department.

L.C.C. Loan Interest Rate.—The Finance Committee of the L.C.C. has decided that until further notice the rate of interest to be charged by the Council for loans to local authorities shall be 5 per cent.

EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING DECEMBER, 1915.

THE December return of electrical exports and imports marks the close of a year which will be noteworthy for many years to come. For some time the monthly statements indicated a continuous improvement in electrical export business, but the December total of £349,409 shows a considerable falling away from the high level of the preceding month, £522,059. The electrical imports showed a similar, though less marked, tendency, the total for December £238,691 comparing with £250,343 in November. The re-exports were valued at £24,382, as compared with £30,560 in November.

A glance through the various sections of the exports shows that the falling off in values was wide-spread, and most conspicuous

in cables, telegraphic material, and machinery exports. On the other hand, both machinery and cable imports were on an extended scale in December, and this also applies to imports of lamps and parts which reached nearly £30,000 in value. Telegraphic and telephonic imports were practically halved, and battery and carbon imports also fell off in value.

The Australian Commonwealth, New Zealand, and India were all good markets during the month, the former being credited with as high values as during pre-war days.

To France also we supplied considerable material. American electrical imports fell off by some £30,000, as compared with November, while Dutch imports included over £20,000 worth of lamps and parts.

Registered Exports of British and Irish Electrical Goods from the United Kingdom.

Destination of exports and country consigning imports	Electrical goods and appliances.	Wires and cables, rubber insulations.	Electric lighting fittings and accessories.	Electric glow lamps. TOTAL EXPORTS: £349,409

TOTAL RE-EXPORTS: £24,382

TOTAL IMPORTS: £238,691

NOTE.—The amounts appearing under the several headings are classified according to the Customs returns. The first and third columns contain many amounts relating to "goods" otherwise unclassified, the latter, doubtless, consisting of similar materials to those appearing in adjacent columns. Imports are credited to the country whence consigned, which is not necessarily the country of origin.

ELECTRICAL EXPORTS AND IMPORTS DURING 1915 AND PREVIOUS YEARS.

SINCE the year 1909 it has been the practice of the ELECTRICAL REVIEW, at the commencement of the year, to publish a graphic summary, showing the value month by month of the British electrical exports and imports during the last and previous years, the curves of values being based on the monthly statistics which are a regular feature of this journal.

The steady progress which had, on the whole, characterised both branches of business—but particularly the exports—for some years, was brought to an abrupt conclusion with the opening of the great European war in the beginning of August, 1914, the immediate effects of which were discussed in our last yearly summary,* and strikingly indicated by the curves of business for the preceding 12 months.

fact that despite the war this section of our export trade was but little inferior to that of 1911.

It will be a matter of interest to many and satisfaction to most that the electrical imports curve, on the whole, shows a declining tendency, after the rapid recovery to almost normal values at the end of 1914.

The re-export curve shows the depressed condition of this class of business—in any case of small amount—during the greater part of the year, pre-war values being reached only during the last two months.

The gross values of our electrical exports and of the telegraphic material included therein for the period covered by the curves shown in fig. 1, were as follows:—

	Gross	Telegraphic
1911 ...	£1,600,000	£560,000
1912 ...	6,300,000	1,500,000
1913 ...	7,568,000	2,388,000
1914 ...	5,189,000	835,800
1915 ...	4,564,000	690,300

The lower export curve (dot and dash) is exclusive of telegraphic exports. Value in thousands of £.

FIG. 1.—CHART SHOWING MONTHLY ELECTRICAL EXPORTS AND IMPORTS DURING THE PAST FIVE YEARS.

Since that time the British nation, and indeed the British Empire as a whole, as well as practically the whole of industrial Europe, has been engaged in a war of ever-increasing magnitude, which has more or less involved the concentration of the entire financial and industrial resources of the countries concerned on war measures, to the exclusion almost of normal trade. Moreover, the financial dislocation of Europe has affected the purchasing power of probably every commercial country in the world, and to this can be added the very pressing difficulties of shipping—the conditions, in fact, being extremely unfavourable to overseas engineering trade of any kind. It is therefore with satisfaction that we can point to the unlooked-for steady expansion of electrical export business during the past 12 months of war, as shown by the two upper curves in fig. 1. Although the extreme fluctuations in telegraphic export values which characterised former years were absent in 1915, yet a steady business remained, and a comparison of the electrical export business (with and without telegraphic exports) of the year, with previous years, reveals the

These figures represent a monthly average of general business—as shown by the dot-and-dash curve, for 1911, of £338,000; 1912, £400,000; 1913, £432,000; 1914, £362,000; and 1915, £323,000. It should be noted that during the first half of 1914 export values were at a high level.

The total value of electrical material imported into this country during 1915, according to our published returns, was £2,646,000, as compared with £2,767,000 in the previous year, and £2,946,500 in 1913; these figures represent monthly averages for the three years referred to of £220,500, £230,000 and £245,500 respectively, showing that a steady falling-off has occurred during this period, despite the preoccupation of home manufacturers.

The re-exports languished during the greater part of the year, reaching a total value of only £198,800, and a monthly average of £16,500, which compares badly even with the £265,200 total and monthly average of £22,000 in 1914, when the first effects of war were felt.

Fig. 2 shows the trend of values in two of the most important sections of the exports—viz., machinery and cables.

Business in the former exhibited a fluctuating tendency

* ELECTRICAL REVIEW, January 29th, 1915, pp. 168-161.

and the position shows but little recovery since the outbreak of war. The cable exports, on the other hand, have shown a remarkable recovery, under the circumstances, and in

falling away to insignificant proportions during the early part of the year, recovered normal values in November, while lamp imports have steadily increased in value over the 12 months.

FIG. 2.—MONTHLY EXPORTS OF ELECTRICAL MACHINERY AND ELECTRICAL CABLE—OTHER THAN TELEGRAPHIC AND TELEPHONIC CABLE—DURING THE PAST FIVE YEARS.

FIG. 3.—MONTHLY IMPORTS OF ELECTRICAL MACHINERY, TELEGRAPHIC AND TELEPHONIC MATERIAL AND CABLE, AND ELECTRIC LAMPS AND PARTS DURING THE PAST FIVE YEARS.

November last reached a record total, only approached on one former occasion, in 1912. Taken over the whole year, the machinery exports reached a total value of £1,482,000, as against £2,154,000 in the previous year : while the cable exports, exclusive of telegraphic and telephonic cable, which are included in their own sections, were valued at £916,000, as compared with £741,000 in 1914.

Turning to the imports curves shown in fig. 3, it will be seen that the machinery imports reached record values in January and May, but during the latter half of the year values fell off rapidly. The importation of telegraphic and telephonic material, after

FIG. 4.—ELECTRICAL EXPORTS TO CANADA, ARGENTINA AND BRAZIL, 1913-15.

Upper curve includes New Zealand, Australian States and Tasmania; lower curve includes Cape, Natal, Transvaal, Orange River Province and Rhodesia. FIG. 5.—ELECTRICAL EXPORTS TO AUSTRALASIA AND SOUTH AFRICA, 1913-15.

Electrical machinery imports totalled £1,543,000 in value, imports of telegraphic and telephonic material amounted to £154,600, and of lamps and parts to £256,600, during the year; these figures comparing with £1,476,000, £267,500 and £215,000 respectively for the same branches of business in 1914.

Purchasing Countries and Importers Into the United Kingdom.

Of the remaining countries shown in figs. 4 to 7, the first three, showing the course of business with what are ordinarily some of our principal overseas customers, will be viewed with interest.

Fig. 4 indicates that our Argentine business has been falling off since March, 1913, and this process has been to some extent accelerated in 1915, while both Canadian and Brazilian business has

FIG. 6.—ELECTRICAL EXPORTS TO JAPAN, INDIA AND CHINA, 1913-15.

slumped since the war, a position which one would expect, knowing the conditions that exist, particularly in Canada.

Turning to fig. 5, our Australian and New Zealand electrical exports represent the one bright feature of these curves, business in these directions at least being normal; the South African business, also shown in fig. 5, had an improving tendency for many months, but fell away to a low figure towards the end of the year.

Fig. 6, dealing with Far Eastern business, shows that our electrical exports to India only began to show signs of recovery from the effects of the war in the last month or two of the year, while Japanese business, with the exception of one or two spasmodic revivals, remained at a low ebb throughout the year, being in fact exceeded in some months by business with China, a country in which, so far as we are concerned, electrical trade expectations appear to be accompanied by progressively disappointing results. The gross values of our export business to the countries above mentioned for the years 1913 (before the war), 1914 and 1915 (in which the full effects of the war were felt) were as follows:—

	1913.	1914.	1915.
	£	£	£
India	1,769,000	784,000	557,000
Australia and New Zealand ...	1,283,000	1,032,000	1,234,000
Argentina	558,000	448,000	279,000
South Africa	508,000	434,000	293,000
Canada	392,000	318,000	112,000
Japan	309,000	320,000	128,000
Brazil	350,000	176,000	73,000
China	159,000	117,000	88,000

One of the effects of the war has been considerably to increase the to-and-fro electrical trade between this country and neutral and allied countries of Europe. Thus our electrical exports to France during 1914 were valued at over £150,000, while in 1915 they rose to £321,000; the monthly average for the first six months of 1914, before the war, £17,700, compares with £26,700, the corresponding average for the whole of last year.

In a similar manner our export business with the Scandinavian countries and Russia for 1914 amounted to £253,000, but only reached a total of £110,000 and a monthly average of £18,300 during the first half of the year, while for the year 1915 a total of £465,000, and a monthly average of £38,800, are recorded, Russia being a preponderant purchaser, no doubt for military reasons, as was probably the case with France.

Our last curve, fig. 7, shows that during 1915 the United States more than equalled Germany before the war as an electrical importer into this country.

That this would probably be the case was indicated in our last annual summary, when her unique position as the only really free manufacturing nation in the world, able to undertake exporting, was mentioned.

French imports into this country, which were naturally hard hit when war broke out, have made an excellent recovery to a position, if anything, better than they were in before the war, while Belgian imports are, of course, practically unrecorded—only four items occurring during the year, having a total value of £1,600.

The total value of electrical material entering this country from the United States during 1915, according to our returns, was £1,855,000, an average of £155,000 a month, representing twice the value of the corresponding business in 1914, during the first six months of which, however, German electrical imports into this country reached record proportions. These figures are, of course, in excess of normal German imports before the war, which during 1913, for instance, were valued at £1,632,000, or a monthly average of £136,000. From our ally, France, we received £167,000 worth of electrical material, or rather more than in 1914, when the total was £122,000.

Apart from the countries above mentioned, the neutral countries of Europe—Sweden, Norway, Denmark, Holland and Switzerland imported a greater value of electrical material into this country during last year than in 1914. In the case of Sweden, Norway and Denmark together, this business was valued at £180,000, as against £166,000 for the previous year. Dutch electrical imports reached a total value of £153,000, as compared with only £60,000 in 1914, and a considerably less amount in 1913; while Swiss electrical imports were also valued at £153,000, as against only £88,000 in 1914.

The greater part of the Dutch imports represent lamps and parts, of which during the year some £125,000 worth entered this

FIG. 7.—ELECTRICAL IMPORTS FROM GERMANY, U.S.A., BELGIUM AND FRANCE, 1913-15.

country; in other words, we have been buying over £10,000 worth of lamps per month from Holland during the last year, as compared with £1,400 worth before the war.

General.—In view of the adverse circumstances which prevailed throughout the whole of 1905, the marked revival of our electrical export business was a most welcome, and, we confess, unlooked-for feature of the year, in connection with which, however, it must be

remembered that relative values show a considerable increase on pre-war days. Of the future it is difficult to say anything; but as it appears that despite the intensive development of munition making and concentration on war work, the British electrical industry possesses a sufficient surplus manufacturing capacity to enable it to make a very effective bid for overseas, as distinct from European war business, there is some ground for hoping that the present year will not compare unfavourably with 1915, so far as export business is concerned. The strong position of the American electrical importer into this country, in the absence of effective European competition, was, of course, foreseen; what the effect of this may be after the war is an interesting speculation, especially if it should happen that an adverse tariff handicaps German efforts in this country. For the present, however, there is little doubt that the Americans will retain their position as importers.

THE PREDETERMINATION OF THE PERFORMANCE OF DYNAMO-ELECTRIC MACHINERY.

PROF. MILES WALKER'S paper was read before the BIRMINGHAM LOCAL SECTION of the INSTITUTION of ELECTRICAL ENGINEERS, on January 12th. An abstract of the paper appeared in our last issue.

MR. R. ORSETTICH said that Prof. Walker's calculation sheet was the shortest he had ever seen; in his opinion it was cut down too far. He also thought the design sheets should be drawn up to include results of tests. Some reference should have been made in the paper to observations of temperature rises by means of detectors, as information on this subject was of great importance.

Prof. G. KAPP said that he had suspected for a long time that a flat cooling slot was not satisfactory. He found that the conduction across a group of laminations was about 100 times less than along the laminations, hence the cooling along a radial slot was not much good. A tube cutting across the laminations was more satisfactory.

MR. W. MARDEN said that probably the more correct criterion for deciding if the thermal limit of the frame size had been reached, would be the product of $A_p B$ and $I_a Z_a$, a term proportional to the output per revolution, though this also would not be constant where a large range of speed was covered on the same frame. The ratio of the magnetic loading to the current loading would also differ when for convenience the same frame was used both as a synchronous generator and an asynchronous motor, due to the necessary change in magnetising characteristics. The advantage of the author's calculation sheet over the methods in which the flux per pole was dealt with was not marked, since in this case also it was usual to employ as a guide the value either of the total armature current turns per centimetre periphery, or the figure for this value corresponding to the particular pole pitch. His constant K , was a combination of various factors, each of which could be separately influenced by changes of design. The fact that the actual value did not change largely for a given type, direct-current generator, alternator, or asynchronous motor, was perhaps fortunate, but it was better to keep well in view each of the separate factors that were subject to change.

MR. R. G. JAKEMAN said that in calculating the magnetising current of induction motors as shown, Prof. Walker advocated the use of the maximum flux density. It was well known, however, that if the field-form constant, K_f , was taken the same throughout, this method gave entirely wrong results if there was high saturation in the magnetic circuit. Hence it was necessary to take a different value of K_f (the ratio of the mean density to the maximum) according to the amount of saturation. It was his experience, however, that the method published by Dr. Kloss and Dr. Smith, which, considered the density one-third of the way along the pole pitch instead of in the middle, gave excellent results for the magnetising current, and was entirely independent of the saturation in determining the flux density in the teeth of an alternator or direct-current machine. It seemed to him quite as easy to estimate the virtual number of teeth per pole, as to estimate the value of K_f , since the latter could not be worked out in each case.

The paper was also read and discussed by the INSTITUTION of ELECTRICAL ENGINEERS in London on January 13th.

PROF. S. P. THOMPSON, in opening the discussion, expressed appreciation of the valuable material contained in the paper. It seemed possible to be too minute in calculation in view of the practical limits to which they had to deal, but it was necessary to have the theory well in hand. He agreed with the author's summary of practical design methods, which could not be better stated. The empirical formula $k_w/\text{r.p.m.} = d^2 l$, brought before the Institution some 30 years previously by Mr. Eison, and based on experiments with machines of different size, speed and output, was found to be scientifically correct, with the addition of a suitable constant. The author had shown how to build up graphically the curve of electromotive force for any single conductor which the rotor pole was passing, and this had been done in another way for years. But whatever method was adopted, the important point was the working result. The author's arithmetical method of finding, for a distributed winding, the E.M.F. form which results from a pole field form of particular shape, simplified the old

graphical method of plotting a number of identical displaced curves along a base line and finding from them a resultant wave form. He doubted whether it was wise to use the same machine schedule for all types of machine; it would probably be better to use a schedule for each type.

MR. EVEREST said the author had divided his subject into four parts. He urged the value of uniformity of calculation methods, which was desirable, but he (the speaker) thought impossible until the professors agreed to adopt identical methods, including formulae and symbols. As a rule, it was necessary now to translate from one to another, and much time was lost in finding what it was all about. There seemed to be no reason why symbols should have different meanings in so many cases, as one had to think what they meant. He felt it was really not advisable, from the point of view of the design office, to use a single calculation sheet for a number of different machines. The essential characteristics of a machine should appear prominently, as also any factors assisting to produce them; it was a mistake to combine several coefficients in one expression. The author compared the advantages of using maximum air gap density as against total pole flux as a basis of design, and he (the speaker) preferred the latter, as also the mean density across the total pole pitch, which enabled them to obtain the magnetic loading. As regarded cooling with narrow ducts, he suggested that the cooling value of a duct was really determined by the ratio of the surface to the cross-section.

MR. H. BURGE said designers of electrical machines were still worried by limits set by engineers to current density in armature and field windings; the author, however, made no reference to this in connection with temperature rise. A good deal could be said for the proposal to boil down the E.M.F. formula to one standard form for all types of machines, but he did not agree with it.

MR. HAWKINS agreed that almost all classes of machines could be designed on similar lines, and that it might be advantageous to use one design-sheet, simply from the facility gained by using the same method; he did agree that much would be gained by comparing the quantities of different types of machines on one sheet. The author had advanced strong arguments for retaining the maximum value of B_p in an expression of the fundamental E.M.F. equation, based on the total flux, one reason being the ease with which maximum flux density on the teeth could be calculated, but it had its drawbacks.

DR. S. P. SMITH was glad the author had suggested that they should arrive at some common method of designing machines, and wished the paper had been confined to that only. He proceeded to show that Eison's expression for the output of a machine gave them the relation between the two methods referred to by the author.

MR. H. ROTTENBURG asked whether the Institution could not arrange to collect a list of symbols in use and publish them in parallel columns, so as to bring home the absurdity of the present situation.

PROF. WALKER briefly referred to one or two points raised, but reserved his reply to the discussion.

THE DESIGN OF HIGH-PRESSURE DISTRIBUTION SYSTEMS.

The paper by Mr. J. R. Beard was discussed at a meeting of the SCOTCH LOCAL SECTION of the INSTITUTION of ELECTRICAL ENGINEERS, in Glasgow, on January 11th.

MR. A. PAGE (Glasgow), noting that Mr. Beard advised that the area to be served should be as large as possible, recalled that Mr. Lackie, in his presidential address to the Institution of Shipbuilders and Engineers last year, said that, in his opinion, the supply for the whole of Scotland could be best undertaken from three power stations. In connection with the cost of sub-stations, in Glasgow they were employing girls as switchgear attendants and finding them to do the work very satisfactorily. In his remarks on switchgear, Mr. Beard again confirmed that the load which had to be carried had really very little to do with the design—the gear must be capable of dealing with a heavy short-circuit current. Far too much shoddy sub-station switchgear had been installed. Dealing with the economical section of mains, Mr. Page said that in Glasgow they seldom took into consideration the exact requirements of a small consumer. They had standard sizes of cables, and one was selected which might have little relation to the immediate load, but was laid down for flexibility and future development in the way of sub-stations or public works *en route*. He had worked out for Glasgow the following figures corresponding to those given by Mr. Beard in his paper:—Pressure actually adopted, 6,600 volts; number of switches per mile of main, 2.78; average max. kilovolt-amps, per mile of main, 1,000; most economical voltage, 8,000, i.e., 1,400 above the voltage which Glasgow was actually employing. Sooner or later they must go to higher voltages if they were going to deal with heavier loads.

MR. WHYSALL (Greenock) expressed the opinion that protective gears of the balanced type were extremely effective and satisfactory in operation. In Manchester it meant the addition of another current transformer and a relay, but nothing more was needed in many cases. The Merz-Price gear was extremely satisfactory, and one was particularly interested in

this type because of the possibility of applying it to systems which were already in existence, and had been designed without any thought of protection such as was desired to-day.

The CHAIRMAN (Mr. D. A. STARR) said his impressions a few years ago were that overhead lines were more subject to breakdown than underground cables, but his subsequent experience with more than 50 miles of 11,000-volt overhead transmission had been sufficient to satisfy him that when overhead lines were well designed and regularly patrolled they were as reliable as underground cables, particularly in Renfrewshire and Lanarkshire, where they were subject to subsidence. With a good complete balanced protective gear they had not had any trouble for a long time. Wayleaves had been the cause of much trouble in the south, but if the proprietors were judiciously approached, much more satisfactory results might be achieved. He could not see the necessity of making switchgear absolutely fault proof.

Mr. W. W. LACKIE (Glasgow) said there was a similarity between the system advocated by the author and the Glasgow low-tension network. They had made a practice for many years of laying down a definite size of network in each street, irrespective of the immediate demands, and as the load grew in any particular district they laid a new feeder to a point mid-way between two adjacent feeders. The system of interconnecting extra-high-tension mains had only been rendered possible by the work of Messrs. Merz, Price, and Hunter. The main switches should be of the very best design, as they had to stand enormous strains. In Glasgow the problem was rather different from that discussed in the paper, as they were dealing with sub-stations each containing between 5,000 and 6,000 kW. of plant, which necessitated at least one feeder to each sub-station.

Mr. BEARD, in the course of his reply, said that air cushions and vent pipes on switches were of little good apart from the fact that a vent pipe took away gases from switches and made it safe to operate switches for the second time; otherwise, owing to gas hanging about, the switch might be damaged at the second closing. His opinion had been confirmed that earthing feeders formed the cause of innumerable mistakes in pulling out the wrong feeder, and the danger to employees in this direction was a serious one. Some of the interlocking arrangements which had come out lately were not very complicated. In taking the cost of the distribution system, he took two-thirds of the fixed charges, and not two-thirds of the cost. The regulation of wattless current and load between the power stations on the system he had shown was carried out by the whole operation being centred in one man named the "system engineer," who told the various stations the load to run at and the wattless current they had to run on—the wattless and governing machines being adjusted accordingly. Between the sub-stations the load factors were kept by ammeters, and in a few cases where it had been found advisable some form of adjustment bus-bar had been installed. He thought on the whole working, however, the number in use at present was about a dozen. This was not a very serious problem, and in many cases they were only operated at 20,000 volts, though in some systems now being laid out a higher voltage would be adopted. The balanced current system which he referred to in the paper was the Merz-Price system, and he dealt with the balance protective gear which one got by connecting three transformers together. Most people had two with the main earth leakage protection. They had used this much for tail ends, and also had adopted it to transformer protection to make it more sensitive to faults to earth. It was only suitable for tail-ends, however, and did not detect faults between phases, which, of course, were most important on big systems. In Newcastle, overhead mains were found not too reliable, although very great attention had been paid to them. He understood that in South Wales where, like Mr. Starr's district, they were troubled with subsidence, cable faults were three or four times as numerous as those upon the North-East Coast system. The wayleave question was one which had brought about pretty general trouble, but he understood the Institution purposed taking some action as soon as things returned to normal. He could not agree that America was now in the front with switchgear. There were certain cases of small lighting distribution where they had put in automatic control which kept the voltage constant on the sub-stations. These gave perfect satisfaction, but for the power supplies the need did not arise, for the H.T. voltage could quite readily be kept within reasonable limits.

ELECTRIC HEATING.

Mr. S. WILKINSON's paper on "Electric Heating: Its Present Position and Future Development," was discussed at a meeting of the SCOTTISH LOCAL SECTION of the INSTITUTION of ELECTRICAL ENGINEERS in Edinburgh on December 14th, 1915. An abstract of the paper was given in our issue of December 24th, p. 828.

Mr. WEAVING said he had carried out a number of experiments which confirmed the opinion that a high loading was economical, and with the aid of a thermostat still higher loadings might be used and still further economy effected. Pre-

vious thermostats, while they might look after the temperature of the atmosphere, required a great deal of attention themselves. The thermometer and breaker described in the paper were very simple and, speaking from experience, seemed reliable. He had found it to break with case 30 watts at 200 volts. Manufactured in quantities, the apparatus should be inexpensive. The principal feature of Mr. Wilkinson's thermostat was that it dispensed with a battery. As a result of experiments, he (Mr. Weaving) had found that for heating purposes electricity at 3d. per unit was equal to gas at 2s. 3d. per 1,000 cu. ft. The large proportion of electric fires sold as compared with lamp radiators left no doubt in his mind as to which would be the survivor.

Mr. W. W. LACKIE (Glasgow) said that the principal recommendation in favour of the electric radiator was that it could be placed exactly in the position where the heat was wanted. The author gave some figures showing the quantity of electric power necessary to heat a room, viz., $1\frac{1}{2}$ to 2 watts per cu. ft. While this amount might be necessary to heat a large area, there were many places where less would do. For instance, in a dining room of 3,600 cu. ft. he found a radiator taking one unit per hour placed under the dining-room table, give as good results as a big coal fire. In November, 1914, the Glasgow Corporation rented premises for the administration of the Prince of Wales Relief Fund, and the electricity department were called upon to supply the necessary heating. The principal apartment was 60 ft. x 36 ft. x 12 ft. high, having a total capacity of 25,000 cu. ft. By arranging the radiators alongside individual desks, ample heating was found to be provided by the installation of radiators taking a total of 10 kW. The premises were occupied for practically a year, and the consumption of energy was 17,000 units, which at 3d. per unit gave a bill of £55, or a return of £5 10s. per kW. It was generally admitted that radiators should give off a large percentage of radiant heat. A captain on a 4,000-ton tramp steamer had a 4-element 1,000-watt dull radiator fitted in his cabin, and complained of feeling cold with an air temperature of 67 deg. F. Two of the 250-watt elements were removed and replaced by one radiant element taking 290 watts; with an air temperature of 57 deg. F. he said: "Now we are nice and warm!" That was to say, 730 watts gave him more satisfaction than 1,000 watts did. The Glasgow Corporation opened a showroom about three months ago, and in the first ten weeks that showroom sold 450 pieces of electrical apparatus representing 752 kW., whilst contractors and firms who dealt in such appliances stated that increased custom had been traced to advice given by the showroom staff. In a Glasgow suburb called Dumbreck, eight villas had been equipped electrically throughout. The size of these houses varied from 7,000 cb. ft. to 12,000 cb. ft., and each house had 10 to 12 kW. of heating appliances, including water heating. The largest consumption for any one of the houses for the year ending May, 1915, was 14,000 units, giving a bill of £40; in other cases the annual consumption was only half of this. Speaking broadly, however, the consumption of electrical energy in a house might be anything from 10 to 50 times what it would be if lighting only were taken. These eight villas were all on one main. The aggregate maximum demand, taken on one of the recent very cold days in November, was only 17 kW., which gave a diversity factor of 5 on the total of 80 kW. installed. This was practically the same diversity factor as they had in lighting. In Glasgow they had 10,000 domestic consumers, and 2,500 of these had heating appliances of some kind; their total consumption for lighting was 500,000 units, and for other purposes, 1,000,000 units. A large number of street lavatories in Glasgow had water heaters installed, taking from 3 to 10 kW. each. The annual bill for these varied from £7 to £30 per annum, depending on the size of lavatory, and they had had no complaint about the cost nor serious trouble with the apparatus. Mr. Goslin, the electrical engineer to the Glasgow Corporation Tramways Department, had given some very valuable information with regard to the electrical heating of the head office of the department. They had had electric heating installed for ten years. At first a hot-water system was installed, but it was found unsuitable owing to the various hours' work in the different offices. Mr. Goslin had found that the question of electric heating was bound up with the question of ventilation. Where heating was adequate without the accompanying provision of ventilation, complaints were soon heard of dry throat and other forms of discomfort and irritation. Mr. Goslin's conclusions, briefly, were that with thermostatic control the saving might be anything from 43 to 87 per cent.; without thermostatic control he found a room heated to a temperature of 74 deg. F., whereas with automatic control the temperature was kept between 59 deg. and 60 deg. F. Mr. Goslin had carried out a very comprehensive experiment in a test room where he had 36 thermostats scattered throughout the room at different heights. He found that there was as much as 10 deg. difference of temperature between a place near the ceiling and one near the floor level; also that there was a difference of 5 deg. between the temperature near a window and that of an adjacent wall. This pointed to the fact that the thermostat must be very carefully placed in a room. He also established the very practical fact that one watt-hour raised 100 cu. ft. of air 1 deg. F. Mr. Goslin recommended large low-temperature heaters and automatic air regulators.

Mr. R. ROBERTSON (Glasgow) contended that the industry got a big set-back some years ago by the installation of radiators much too small for the work they were put to. Mr.

Wilkinson's minimum figure of 1½ watts per cu. ft. to be heated was very nearly correct. In making up data in an experiment similar to that of Mr. Wilkinson's, he was struck with the divergent results obtained in different rooms due to the position of doors, windows, fireplaces, etc., some rooms requiring as much as 25 per cent. more than others per cubic foot. He agreed that the best results were to be obtained by the installation of a small luminous radiator for cheerful effect and a large controlled radiator for temperature rise and maintenance. For the thermostat and circuit-breaker, as outlined by Mr. Wilkinson, to be a success, one would require to be installed in each room of a house. If a saving of anything approaching 75 per cent. could be got, as in the case of gas, a case was clearly made out for thermostatic control, and any extra capital cost would be more than justified.

In replying, Mr. WILKINSON said that the thermostat could be made suitable for the regulation of temperatures in water or in ovens. It was marvellous what results could be obtained when a radiator was properly placed and controlled. The figures given by Mr. Lackie as to the sales from his showroom proved conclusively the soundness of the business policy in opening such an establishment. The cost of the thermostat was 52s. 6d., with 2s. 6d. for the resistance. What was wanted for domestic heating was a large black heat convector and a small luminous radiator.

AMERICA AND FOREIGN TRADE.

THE Chief of the Bureau of Foreign and Domestic Commerce, U.S.A., Dr. E. E. PRATT, has recently issued his first report. According to the official summary of this statement published at Washington, Dr. Pratt says that the European war has suddenly thrust before the eyes and imagination of the American business community the subject of foreign trade. A large part of the report is devoted to a discussion of commercial conditions brought about by the war and to constructive suggestions for further extensions of American trade abroad.

After describing in detail the growth of U.S. foreign trade during the first twelve months of the war, Dr. Pratt asserts that the American business community should guard against any sense of safety in their present prosperity in so far as that prosperity is based on business connected with the belligerent activities in Europe. He warns business men to carefully discount the continuance of so-called war orders and avoid basing future calculations upon conditions which they bring into existence. Two of the great problems that must be solved if the United States is to make the most of its present opportunities receive much attention in the report, namely, financing foreign trade, and the problem of educating men to carry on such trade.

In spite of the fact that Americans are making headway in financing their foreign trade the report insists that they can never hope to gain the really big prizes in foreign trade until they are prepared to loan capital to foreign nations and to foreign enterprises. "The big prizes in foreign trade are the public and private developments of large proportions, as, for example, the building of railroads, the construction of public-service plant, the improvement of harbours and docks, the digging of canals, and many others which demand capital in large amounts. New countries are generally poor. They look to older and richer countries to supply them with the capital to make their improvements and to develop their resources. The country which furnishes the capital usually sells the materials and does the work. In the last analysis it comes to this: The country that wants the business must finance the purchases, since the improvements will be made and the materials paid for out of the money loaned."

The other problem of commanding importance in the development of U.S. international commerce is the education of men for foreign trade. "It is absolutely necessary that we train men to carry on our foreign trade, for we find ourselves to-day without an adequate supply. This problem may be regarded as the very fundamental of success in this field." Our banks cannot establish branches because they have not the men with which to man them. Our manufacturers find it difficult to secure salesmen. Our investors cannot find competent advisers on foreign offerings."

The report takes up such questions as the necessity of a definite foreign commercial policy for the United States, the revision of commercial treaties, the much-discussed subject of a merchant marine, co-operation in foreign selling, free ports, and commercial preparedness. It is stated that the effectiveness of the Bureau's work in promoting American trade in foreign countries is best shown in the definite practical results obtained. To prove that such results have been well worth while, the report takes up in detail a number of the largest contracts that American firms have closed as a result of the Bureau's activities. Perhaps the largest order of this kind resulted from placing representatives of a Russian concern in touch with American exporters of raw cotton. One of these exporters reports that it has closed a five-year contract for 40,000 bales of cotton annually, which will amount to two or three million dollars annually, or between ten and fifteen million dollars during the life of the contract. The report continues:—

"We are also informed of four other specific instances of orders, each one of which amounted to a million dollars or more, the information concerning which was first published in our foreign trade opportunity service. These are: A railroad for the island of Formosa; a coal-handling plant for the port of Durban, South Africa; battleships for a South American republic; and arsenal machinery for the arsenal at Hang Yang, China."

"Recently we were informed by a large milling concern in the West that a little over two years ago they formed a business connection with a concern in Turkey. The name of this concern had been obtained from the Bureau. During the past two years the amount of business done with this one concern has amounted to over \$500,000."

Numerous instances have come to our attention where the results in each instance have been smaller, but nevertheless important. For example, information published on foreign trade opportunities resulted in a contract for a new telephone system for Bergen, Norway, amounting to \$201,000; a contract for a petroleum pipe line at Bucharest, Roumania; a contract for the construction of the capitol of Taihoku, Formosa."

As a result of a conference with the King of Spain, a commercial attaché of the Bureau opened up markets for about 3,000,000 tons of American coal annually. This conference resulted in the removal of the Spanish transport tax on American coal that had previously been a great obstacle to gaining a foothold in this market. Dr. Pratt calls special attention to the new and important commercial-attaché service made possible by an appropriation of \$100,000 by the Sixty-third Congress, and urges that a still greater expansion of the Bureau's work abroad is imperative under present conditions and under the conditions sure to exist in the future.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

AMENDMENTS.

SWEDEN.—Exportation of the following articles has been prohibited: Copper (manufactured or raw) refined from raw material (not from scrap) at a Swedish factory; nickel scrap, cast nodes of nickel even if provided with ears with or without hole; nickel wares, viz., sheets and hoops, rods, nails and rivets, also bolts, pipes and tubes, wire and wire cloth.

SWITZERLAND.—The Board of Trade has been informed that the Société Suisse de Surveillance Economique at Berne began operations on November 16th. The electrical and similar articles of which the Society will take delivery, and for which it will in future be the only authorised consignee in Switzerland, are enumerated in the accompanying list. These articles can only be consigned to the Society if its written consent has first been obtained by the ultimate consignee. Consequently, no export or transit licences will be granted in respect of such articles unless the application is accompanied by the document proving the consent of the Society. Articles destined for Switzerland from the United Kingdom, France, Italy, and Russia in respect of which export licences have been granted or conditionally authorised before November 16th, and articles from neutral countries in respect of which transit permits have been similarly granted, may be exported or allowed to pass in transit without being assigned to the Society, in virtue of the special guarantees already given by the Swiss importers. All applications to the War Trade Department for licences which have not yet been favourably considered or conditionally authorised should be renewed, and accompanied by the document proving the consent of the Society. The following are among the articles referred to:—

- Accumulators, electric, and accumulator glasses.
- Aluminium in all forms and aluminium manufactures.
- Asbestos, crude and manufactured.
- Cable, insulated.
- Celluloid, raw, in bulk, sheets, rods, tubes, clippings and waste.
- Detonators.
- Electrical firelighters.
- Electrical carbons.
- Electrical insulated wire and cables.
- Electrodes, piles, and component parts.
- Graphite.
- Instruments, nautical, observation, geodetical, and optical.
- Machine tools and parts thereof.
- Machinery for use in marine and aerial navigation.
- Machinery, electrical, electric dynamos, and motors.
- Magnetos.
- Mica, rough and worked.
- Rubber, vulcanised, in sheets.
- Surgical instruments and apparatus, including rubber gloves.
- Telegraphs, material for.
- Tungsten in all forms.
- Vehicles of all kinds used in military or naval transport.

MOROCCO.—With reference to the prohibition of the importation of enemy goods into the French zone, the Board of

Trade understand that certificates of origin are required for all goods imported into that zone, and that so far as British goods are concerned the authorities will accept certificates issued by Chambers of Commerce in the United Kingdom if drawn up in the form which is accepted by the French Customs authorities in the case of certificates issued by Chambers of Commerce in respect of certain goods for which they are required in France. The signature of the issuing authority must, however, be legalised by the local French Consular Officer.

URUGUAY.—A Decree, dated September 13th, lays down regulations respecting certificates of origin in respect of goods shipped to the Republic of Uruguay. The Decree provides as follows:—

Article 1.—The Uruguayan Consular Agents are authorised to issue—when requested to do so—certificates of origin and nationality in respect of goods destined to be imported into the Republic of Uruguay.

Article 2.—The certificates must be presented in duplicate to the Consular Agents, must be drawn up in Spanish or in French, must be signed by the consignor of the goods, and must indicate the marks, numbers, and quantity of the packages, the nature of the receptacles, the nature of the goods, the gross weight, the origin or nationality of the goods, name of the consignee (in the case of goods not declared "to order"), and the ports of shipment and of destination. Each certificate may relate to only one consignor and consignee.

Article 3.—The Uruguayan Consul at the port of shipment may also issue certificates of origin for goods to be shipped with the option of being unloaded at either a foreign or Uruguayan port, provided the goods are consigned to a firm established in Uruguay.

Article 4.—Consular Agents shall *viser* certificates of origin, return the duplicate to the consignor of the goods, and send the original at once to the Uruguayan Consul at the port of shipment, informing the consignor that the duplicate should be transmitted to the respective shipping agent at that port, in order that the agent may present it, together with the respective manifests, bills of lading or "parcel-receipt," to the Uruguayan Consul there. The Consul shall make the necessary verifications, affix the original of the certificate of origin to the copy of the bill of lading or "parcel-receipt," which is to be delivered to the master of the vessel, and shall send the duplicate certificate, along with the other documents required by the Uruguayan Consular Regulations, to the Customs Department at Montevideo.

Article 5.—The Consul at the port of shipment, after checking the certificates of origin from the shipping documents, shall note on both (the original and the duplicate) the name of the ship on which the goods were loaded.

Article 6.—In the case of goods sent by parcels post, the duplicate of the certificate shall be sent to the Customs Department at Montevideo and the original returned to the interested party in order that it may be attached to the postal dispatch note.

Article 7.—Consular Agents shall charge the following fees for the visa of certificates of origin or nationalisation of goods, viz.:—

For the visa of each certificate in respect of goods to be accompanied by bill of lading or "parcel-receipt"	1 peso.
For the visa of each certificate in respect of goods to be sent by parcel post	20 centavos.

Two Interesting Problems.—The *Wireless World* recently propounded the following problem, which had been set to an advanced class of electrical engineers in a well-known college in Liverpool:—"Consider the cube to be constructed of a series of wires representing the edges—i.e., a to b = one wire, b to c is

another, &c. Each has a resistance of 1 ohm. What is the total resistance A to B ? If, instead of being constructed of a series of wires, the cube were made of sheet metal, each side having 1 ohm resistance, what would be the resistance between A and B ?

Another little problem presented by our contemporary is the following:—"Given two steel rods exactly alike in appearance, you are told that one is a magnet. How would you tell which piece was the magnet if you had nothing with which to suspend the rods, no point to poise the rods upon, no other pieces of iron or steel to attract, and no instruments of any kind?" This problem was submitted by Electrician H. Christie, R.M. of H.M.S. *Bombardier*.

Both problems are puzzling at first sight, but yield to simple methods of attack.

A FORTNIGHT ago Mr. Asquith made an announcement in the House of Commons of far-reaching importance. He pointed out that "the adoption of dilution, that is to say, the employment during the war period of semi-skilled and unskilled and female labour on any class of work upon which it can be usefully employed, so as to set free skilled workmen for the work which they alone can perform, offers the only prospect of securing a sufficient supply of munitions to enable the war to be brought to a speedy and successful conclusion." He went on to point out that we cannot rely upon foreign supplies, because the demands upon our financial resources and our shipping would present insuperable difficulties. He also said: "The necessities of the war have been pointed out both to the owners of controlled establishments and to the representatives of the great trade unions, and they have loyally pledged themselves to support the Government in the scheme of labour dilution, the necessity for which has arisen from the national requirements and not from any demand by employers."

We have little doubt that the employers, so far as in them lies, are ready and willing to redeem their pledge. Wholly apart from the war, they have been striving for years past to get rid of the arbitrary distinction between skilled and unskilled labour. They have so striven in the interests of Labour itself. To them competition, whether at home or abroad, has been a reality; to the worker, the fact that the employer has been able to carry on at all is sufficient guaranty that the existing trade union rules are satisfactory in their operation.

We have no doubt either that the representatives of the great trade unions will do their best to redeem the pledge; but will those whom they purport to represent to their part? That is the real point. It is satisfactory to learn that during the last few days in various industrial centres the "dilution" process has at last been permitted to make some headway—for the period of the war. Perhaps Monday night's air-raid of industrial works may serve to hasten the rate of progress!

In the electrical industry where employers and men have played so prominent a part in the manufacture of munitions, we have no doubt that, given the necessary desire, the skilled men of to-day could do work more highly skilled, while the less skilled could soon, with practice, be made more adept. What the present "skilled worker" fears, we presume, is increased competition, and therefore lower wages, in that dim and distant epoch after the war. But we think he may set his mind at rest on that score. Increase the number of skilled workers up and down the country, and you necessarily increase the general capacity of the working community. Increase the capacity of our factories, and you increase output; and increase of output will be sorely needed after the war. If the worker at peaceful industry can be transformed into a munition worker, so the munition worker can, with equal facility, be transformed into an all-round artisan.

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AGEEKAT, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4426 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trade, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 8d.; Canada, £1 3s. 10d. (\$5.80). To all other countries, £1 10s.

FOREIGN AGENTS:

ADLALD: Messrs. Atkinson & Co., Grosvenor Street.

AUCKLAND N.Z.: Gordon & Gotch, Albert Street; The Mining and Engineering Review, 81a, Strand Arcade, Queen Street.

BRISBANE: Gordon & Gotch, Queen St.

CHRISTCHURCH, N.Z.: Gordon and Gotch, Manchester Street.

DUNEDIN, N.Z.: Gordon & Gotch, Princes Street.

JOHANNESBURG, CAPEWY, BROMFORTH, DURBAN, PORT ELIZABETH, &c.: Central News Agency, Ltd.

LAUNCESTON: Gordon & Gotch, Chintiere Street.

MELBOURNE: The Mining & Engineering Review, 90, William Street; Gordon & Gotch, Queen Street.

MILAN: Fratelli Treves.

NEW YORK: D. Van Nostrand, 25, Park Place.

PARIS: Boyveau & Chevillet, 22, Rue de la Banque.

PERTH, W.A.: Gordon & Gotch, William Street.

ROME: Loescher & Co., Corso Umberto 1° 397.

SUNSET: The Mining & Engineering Review, 273, George Street; Gordon and Gotch, Pitt Street.

TORONTO, Ont.: Wm. Dawson & Sons, Ltd., Manning Chambers; Gordon and Gotch, 132, Bay Street.

WELLINGTON, N.Z.: Gordon & Gotch, Cuba Street.

Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, and crossed "London City and Midland Bank, Newgate Street Branch."

NOTICE.

IN view of the recent increase in the Postal Charges, our Subscription Rates for Great Britain and Canada will until further notice be increased to £1 1s. 8d. and £1 3s. 10d. respectively.

It is the abuse of the right of free speech which appears to hamper the Government in bringing the case-hardened trade unionist to see reason. There is the suggestion that no form of compulsion should be brought to bear upon the working man until there is "conscription of capital"; until the so-called rich man is made to surrender all his property to the Government. The "man on the barrel" who preaches such doctrines does not go on to remind his audience that income-tax has been increased by about 150 per cent., and that a Cabinet Minister has stated that the country may have to spend about half its entire income before the war can be brought to a successful conclusion. Nor does he pause to consider or explain what is being done in the Central Empires—how every man, woman, and child in Germany and Austria has been mobilised for war; how the great populations which are at war with us are content to bear deprivation and hardship, consoling themselves by the reflection that, if their lot is hard, it is heavenly compared with that of the soldiers in the field. These considerations are relegated to the background when it is suggested that the working men of England shall "scorn delights and live laborious days" until the war be ended.

Amongst our enemies the people have been taught to believe (howsoever erroneously) that they can win through by sheer industry. Many efforts have been made to teach the same lesson here; and if the worker can only be made to grasp the fact that he is as important a unit as the man in the firing line, we are satisfied that the Government need bring no pressure to bear in the form of compulsion. Great things have already been done; old England, which the Germans thought incapable of waging a war with her population, has already to a large extent proved the contrary. The vast majority of the working men are doing their share in the field and at the bench; it only remains for the minority to abandon their private interests in the interest of their country.

AN INFLUENTIAL APPEAL TO THE GOVERNMENT.

THE Guildhall meeting on "Trade and Employment after the War," convened by the Lord Mayor at the suggestion of a number of organisations interested in the subject, and held on Monday last, was a most impressive event. So far as the speeches were concerned, while they were all good, there was nothing either new in their substance or in the desire and determination that they expressed, but the representative character of the gathering cannot fail to carry weight when the enemy hears of the proceedings, nor should it fail to convince our own Government of the necessity for it to adopt, and that without further delay, a very strong policy in regard to after-the-war trade and the problem of employment. We have Mr. Runciman's assurances that by the time the war ends very complete measures will be found to be ready for safeguarding the interests of British trade against enemy onslaughts. We welcomed the speeches of the President of the Board of Trade because we thought we recognised therein a very definite and thorough-going Government policy. We, however, must not lose sight of the fact that the Board of Trade as it exists to-day is choked with work, and cannot with suitable facility take up the new duties that the situation and traders demand. For instance, the Registration of Firms Bill, which came before the House of Lords last week, had to be turned down, at any rate for the present, almost entirely because the Board of Trade

was too busy with other duties to carry out the investigations, etc., that the measure would have involved. Yet almost every business-man has known during these eighteen months of war how great have been the difficulties of obtaining information respecting private firms—whether they were "enemy" businesses or not. The conviction that found expression in Monday's meeting was that the Board of Trade should continue its various duties for the regulation, control, and administration of trade, but that the Government should appoint a new Minister of Commerce to be responsible for the *promotion and encouragement* of trade. It was not the desire of the gathering to cast reflections upon the Board of Trade. We can re-echo the sentiments of one of the speakers who said that those who from experience knew the Board of Trade best knew well enough that it was not the officials of the Board who were to blame—it was the organisation, which was compelled to handle such various and vast concerns. What a commentary upon our national conservatism lies in the circumstance that it is more than 46 years ago since the commercial men of the United Kingdom first asked for a Ministry of Commerce! Before the German industrial menace or the Prussian military menace had any bearing in our direction—even before the Franco-German war! Yet since then our business men have appealed to Parliament again and again; the Press, including our own modest selves, have urged, in season and out of season, the necessity for action; and all this time we have been congesting the Board of Trade more and more until, as was truly said on Monday, it is too choked to do all that it ought to be doing for the encouragement of trade in these very important days. We wonder what would have happened had there been a Minister of Commerce in office when the war broke out! He and his department might have been able to settle down at once to deal fully with a unique situation full of splendid opportunity. Perhaps, if we dare look further back, we should have had, even before the war, such an investigation of our industrial affairs and such an intelligent grasp of the dangers that threatened, that we should have been better prepared in connection with those "key" industries upon which we are now promised a report.

However, vain regrets will not assist us; resolutions for timely reform are more to the point, and Government action following those resolutions is what we must look for. Reflections on the Board of Trade and the saying of stupid and bitter things about the Department and about Ministers are peculiarly unsuited to the present situation. Other means are more likely to be successful, and we are glad that the Guildhall meeting suffered no loss of dignity in its utterances. The object of the gathering was to show a united front to the enemy and to tender a united appeal to the Government. It is difficult to convey an adequate idea of the importance of the gathering; perhaps we can best do so by stating that there were present seven Lord mayors, 70 mayors, representatives of 51 Chambers of Commerce, and 89 trade and industrial associations, eleven High Commissioners and Agents from the other parts of the Empire, ten banks, and many others representing all phases of commercial and public life.

In the course of the speeches, though detail was avoided, reference was made to the need for reforming the consular service—paying consuls well and allowing them a bonus upon the increased trade of the place under their care—the need for educational (technical and commercial) reform and for the extension of commercial banking, and so on—all subjects which have been done to death in the Press, but have perhaps never before been expressed in a public gathering which had such force and authority behind it. The Lord Mayor, in opening the pro-

ceedings, said that Mr. Runciman's speech, already referred to, showed that the Government was in a "friendly mood." We hope that that friendly mood will not only permit the Prime Minister to give an appropriate reception to the City's deputation when it goes to lay the meeting's resolutions before him but that it will rapidly develop into such a zeal in the interests of British industry and trade as will allow the Houses of Parliament to adopt measures for substantially assisting the business world when it again meets its enemy competitors in the trade war.

One of the resolutions adopted by the meeting called for immediate steps to be taken by the Government and by commercial organisations, to ensure co-operative action for the defence and improvement of trade and employment after the war; recommended full discussion of fiscal, legislative, and other steps for meeting the situation; and suggested the establishment of a Ministry of Commerce to carry out a constructive commercial policy for this country. Another resolution urged close co-operation to improve the commercial relations between ourselves, our Colonies, and our Allies, and to prevent Germany ever again acquiring an undue influence upon our trade and employment.

The meeting was not a "Tariff Reform" demonstration, but the speeches of men of eminence, and of totally different shades of thought in normal times, showed that all were now united in the resolve to "smash Germany" commercially, and wished to acquaint the enemy with that determination of our Empire.

Germany's Submarine Cables After the War.

THE important question of the fate of the submarine cable system of Germany after the war has just been raised by a French contemporary, which also refers to one or two interesting matters of past history. It is first pointed out that what can be considered to be one of the vital points of Germany is situated about 25 miles distant from Emden, namely, the island of Borkum, where begin most of the submarine cables which connect—or which connected until they were cut by Great Britain—the Empire with the world. But this opportune destruction of the cables, in the opinion of the French newspaper, will not be solely a war measure, as it rests with the Allies whether the network shall be reconstituted. This depends upon France above all others. During the course of the 15 years which preceded the present conflict, France gave proof of incomprehensible incoherence from this point of view. Whilst politically the country was practising with complete loyalty the Franco-British understanding, telegraphically if it can be so expressed, a Franco-German understanding was being established, which was so obliging on the part of the French that Prince Bulow in 1912 saw in it a reason for hoping for something better. M. Charles Lesage, inspecteur des finances, narrated in a recent work the extraordinary advantage of the South American Cable Co., a British company which, he says, only had a single shareholder—the French Republic—and whose concession was sold by this improvident shareholder to the German South American Telegraph Co. Germany lacked a submarine connection between the Coast of Africa and Pernambuco; she acquired it in this way at little expense. Not only so, but the matter of the cable to the Azores, although still older, is none the less sad. It appears that Portugal at first refused to grant landing rights to the Germans for a cable which would have been an extension of that from Vigo, but finally a concession was given to the Felten & Guilleaume Co. In this way a French company which held an earlier concession, found itself turned out. These incidents are pointed out in order to prevent any future relapse. M. Lesage states in this connection that if in the dogma of Germanism there were not perceived the principles of universal domination, the assistance rendered by other nations to the German Empire in executing their plan of submarine telegraphy would not be regretted. But German Imperialism has become a fetish, and like all

fanaticisms, it wishes to conquer in order to enslave. The French newspaper concludes that the world will only really be liberated if the network at Borkum is not re-established, or at least if it is reformed only under the control of the victorious Allies.

Lead.

THERE has been no substantial alteration in the position of the lead market. The scarcity of supplies available for disposal renders the market exceedingly tight, and buyers have manifested no new interest in the article, while there seems little chance of any radical change in the fundamental conditions for months to come. The main difficulty is, of course, the shipping situation which appears to become more and more aggravated from week to week. It should surely be possible, by the exercise of elementary foresight, to prevent vessels which reach this country to discharge cargoes having to wait for weeks on end before they can get a berth, and commerce discharging. The utter futility indeed of the labour policy of the authorities of this country is more responsible than anything else for the rise of prices of all commodities. Meantime, the equanimity with which the shipping interests in the House of Commons and outside seem to regard the state of affairs, which has been brought about by official incompetence augurs ill for any remedial action which may be planned having practical effect. If vessels could discharge their cargoes and get out to sea again without the wholly unreasonable delay at present entailed, there would be a 50 per cent. drop in freight rates. Not only does the congestion here, arising from preventable causes, complicate matters, but it at the same time prevents shipments of fuel from the United Kingdom to Spain, and thus further retards the production of lead at its source. America has lately been selling a little more freely, but here again the shipping question presents an apparently insoluble problem to the powers that be. The leading brokers state that many thousands of tons of lead delivered for shipment to Archangel in the late months of last year will not reach that port until navigation is reopened. It seems almost incredible that the bungling and blundering which characterised 1914 and 1915 can still be running riot. Meanwhile, a tight finger is being held upon the trade, and the authorities have given due warning that if any speculative movement develops they will place lead under the Defence of the Realm Act, a proceeding which would entirely stop all market business. It is very doubtful whether the speculation carried on in lead during the last few months deserves any notice whatever, but if it does, effectual steps have certainly been taken to repress such undesirable transactions.

The Wire- Drawing Industries.

THE abnormally high price of electrolytic copper has resulted, as was in some measure to be expected, in a slight easing-off in the demands on copper wire and strip manufacturers' recently. The War Office and Admiralty requirements, however, continue to be heavy, and there is not much likelihood of a lessening in demands in this section as regards the immediate future. In the export section the increased licensing difficulties, and the transport problem, have, between them, made it almost impossible to look adequately after the interests of regular overseas customers. The securing of export trade hitherto done by German wire manufacturers has, consequently, proved practically out of the question; but we are informed that the subject of German competition after the war is receiving the most careful attention of British wire manufacturers, and it is hoped that the German firms will find, when the war is over, that their former success in this country, and in overseas markets, will not easily be repeated. The High-Conductive Copper Association, which comprises many of the most important copper wire manufacturing firms in the country, has in the past considered it not worth the expense and competitive sacrifice to root out the growing menace of German undercutting and subsidisation, as, in order to do so, it would have had to resort to similar questionable tactics.

NOTES ON ELECTRIC WELDING PRACTICE.

(Continued from page 92.)

Resistance Welding.—Resistance welding is not autogenous in nature. The pieces to be welded are held together in the desired position and a heavy current is passed through the contact. Heat is thus generated in the plane of the joint itself, and directly welding temperature is reached additional mechanical pressure is applied to complete the union and current is simultaneously cut off. Though the necessary current density is high, the voltage required to produce it is low, so that A.C. supply is used for economy, and the transformer forms an integral part of all modern welding machines, the welding jaws being mounted on the ends of a single-turn "secondary" casting, on one limb of which the primary is wound (fig. 7).

The uniform production of heat right across the joint is a very important advantage, and this of all welding processes is the one most easily adapted to machine operation by unskilled labour—it is essentially a *manufacturing* process, and is applicable to almost every metal and pair of metals used in practice, and to sections ranging from 15 sq. in. or more of steel down to wires of 1-16 in. or less diameter (though such small sections can frequently be treated more advantageously by percussive welding). Resistance welders up to 200 or 300 kw. capacity are used in rail welding.

The welding of copper and aluminium, so frequently required in electrical work, can only be performed

FIGS. 7, 8, 9, 10, 11 AND 12.

satisfactorily by electrical methods. The difficulty is, of course, that aluminium, copper, and brass are molten at welding heat, and very susceptible to oxidation. Butt welding by its rapid action gives no time for any considerable degree of oxidation to occur, and the mechanical action of the welding machine ensures that the joint is completed and cooling commenced directly after welding heat is attained; also that oxide or other foreign material in the joint is expelled at the moment of "closing."

For maximum quantitative and qualitative results, the weld should be closed automatically both in respect of time and force. At various dates and for various purposes and metals, hand gear, dead weight, balance arm, spring-operated and hydraulic mechanism has been used to provide the "upsetting" force in butt welding machines. Automatic spring closing gear is useful for small sections and for copper and aluminium, which must be upset just at the right moment and in the right manner; also for zinc and lead, which are not incandescent at welding heat, and hence cannot easily be judged as regards the correct closing temperature and force. Hand closing is quite suitable for most metals between $\frac{1}{4}$ in. and 1 in. diameter, and hydraulic gear is necessary for large sections. The closing pressure necessary is about 600 lb. per square inch for copper, twice as much for mild steel or wrought iron, and three times as much for tool steels.

By maintaining considerable closing pressure during relatively slow heating by moderate current, there can be formed a weld with a practically smooth bulge or "upset" which in many cases need not be removed. On the other hand, by just maintaining contact pressure and passing a heavier current, metal in the vicinity of the joint is quickly brought to welding heat, and additional closing force being then applied suddenly, there is produced a ragged fin which must generally be ground smooth. The second or "flash" method is safest for metals liable to burning or oxidation, since metal at the contact is forced out at the moment of closing; this method is alone applicable to such metals as aluminium, and though the current consumed is heavier the welding time is shortened and less of the stock metal is taken up in the weld.

There is no fundamental difference between Thomson's first "nutcracker" welder (with a clamp on each leg and the weld where the nut would be) and the latest types of butt welders, but the latter are much more efficacious, due to mechanical improvements such as parallel jaw slides, quicker setting and clamping, and more complete control to suit all classes of work, particularly repetition work. The commercial success of the butt welder may be dated from the time when it was realised that it should be designed and used as a specialised machine tool.

Though the simplest butt welding operation is to join two initially distinct pieces together end to end, even small hoops or links can be butt welded (though with increased current consumption), notwithstanding the short-circuit provided by the continuous part of the work. There are also many special cases of butt welding: two distinct pieces which demand special attention to the arrangement of the current-carrying clamping jaws and, in some cases, to pre-heating. Valuable applications of butt welding pieces at an angle are to be found in building up all kinds of metal frame, rod and strip work; and among miscellaneous operations often involving angle welding and the union of pieces of very different sections, but resulting in satisfactory construction and material manufacturing economy, may be noted butt welding of heads on to bolts, footplates on to pedal levers, rods on to disks to form gear blanks, pole shoes on to magnet cores, flanges on pipes, and metal handles on knives and forks (fig. 26).

Spot and Seam Welding.—Both spot and seam welds are of essentially the same nature as butt welds, but can often be applied where the latter is unsuitable, as, for instance, in building up thin sheet goods. For both spot and seam welds, one piece is lapped over the other and welded together either at intervals (fig. 8) by nipping between circular electrodes (thus producing the equivalent of rivets), or continuously (fig. 9) by passage between roller electrodes. Mechanical pressure or an intermediate filling disk or strip is depended on to concentrate heating; the second method being the more effective and the first the simpler. Current supply is again through a step-down transformer with single-twin secondary.

As compared with riveted joints, spot welds do not loosen or tear, but are actually a source of added strength. Generally the electrodes leave a distinct depression (some of the metal tending to flow sideways between the plates and hold them slightly apart, as exaggerated, fig. 10); a larger electrode on one side (fig. 11) generally prevents any depression showing there, and to keep both sides at the original level a "filling-disk" of metal may be inserted before welding (fig. 12). A filling disk to serve this purpose and to concentrate heat at the welding spot is specially desirable when welding thick sheets or attaching sheet to solid parts. Another alternative, often desirable, is to weld a dummy rivet head on one or both sides of the joint at the same time that the spot weld itself is made. The strength of the joint

is entirely in the weld. In passing, it may be noted that a spot-welder (which is simply a butt welder with electrodes and general arrangement adapted to the work in hand) can be used to heat and close ordinary rivets if desired. The resistance surfaces are then at top and bottom of the rivet blank, consequently most heat is developed just where maximum mechanical deformation (for head-forming) is required. The process is silent, and it is easy to secure correct thermal and mechanical conditions during closing.

A spot (or seam) welding machine is easily applicable to a great variety of work, including much that could not be dealt with practically by ordinary butt welding. On spot welding galvanised iron, the zinc coating volatilises from the welding contact, thus ensuring a true iron to iron weld without affecting the protective coating beyond the joint. There is no action, however, comparable with the "upsetting" of a butt weld in its displacement of dirt or oxide from the welding surfaces, so that it is necessary to have the latter clean to ensure a sound joint, and also to prevent abnormal contact resistance which, when it breaks down, permits a rush of current burning the work and electrodes.

For repetition work in hardware construction and other light work it is easy to design a nearly or quite automatic spot or seam welder with motor-operated moving parts. Four or five times the output obtainable with riveting (say 15 to 20 spot welds, or 3 ft. or so of seam weld per minute in light work) can generally be relied upon.

A special variety of spot welding is obtained by forming dents in a thin sheet (using a blunt punch) and then resting this sheet, on the apices of its dents, on a flat sheet (fig. 13), after which the two are

FIGS. 13, 14, 15, 16, 17 AND 18.

welded together by current passing from one to the other. Using large electrodes, a number of welds may be completed at a time. Alternatively, one sheet or both may have ridges rolled in them in the form of shallow corrugations, line welds (fig. 14) or point welds at the crossings of corrugations (fig. 15) being thus formed. If desired, the dents or corrugations may be so shallow as to be flattened in the process of welding, this being an arrangement alternative to the use of filling disks.

The methods mentioned in the last paragraph may be used to build double sheet air-casings for stoves, etc., sheet metal pulleys, and, in fact, any parts requiring sheets in close contact or a short distance apart. Current being concentrated at the welding points the process is rapid and economical.

Electrolytic Welding.—The Hohe electrolytic welding process is interesting, but not, so far as the writer is aware, of any great practical importance. The work to be heated is connected as kathode (or held in tongs with insulated handle) in an electrolytic vat (fig. 16) which may have a special anode plate or be itself the anode. The electrolyte may be diluted sulphuric acid; a solution of sodium carbon-

ate; a solution of borax and potassium carbonate; or a solution of sodium and potassium chlorides and carbonates. The only requirements are that it be a low resistance electrolyte and yield hydrogen on electrolysis. The heating vat is connected in a 100-200-volt circuit, and the work rapidly becomes coated with a layer of gas bubbles which offer such resistance that white heat is easily attained. The process is, however, only a heating process, and welding is supposed to be done on an anvil, so that the method is practically limited to wrought iron and mild steel.

Obviously there is necessarily considerable loss of heat, to the detriment of efficiency. The most useful application of the method appears to be to annealing and tempering—either rods, tools or wire. The work is heated as above, and quenched simply by cutting off current altogether, or, in the case of wire, by passing the latter beyond the current-carrying zone (as shown in diagram, fig. 17). Whilst hot, the work is encased in a film of reducing gas, so that scaling and blistering is impossible.

Electropercussive Welding.—The electropercussive system of welding invented, or rather discovered, about ten years ago by Chubb, possesses many unique features. The explosive discharge of a large electrolytic condenser is used to fuse the contiguous surfaces of pieces to be joined, and the weld is then completed by the momentum of one piece, which is moving rapidly by the time it reaches the other and completes the condenser discharge circuit.

Due to the extremely local nature of the heating and the explosive violence of the electrical discharge which blows out oxide, etc., from the weld, reliable joints can be produced between practically any pair of metals, irrespective of difference in thermal conductivity, melting point and liability to oxidation. Local heating as ordinarily understood, as produced, for instance, by arc welding, is liable to set up severe thermo-mechanical stresses, but the heating produced by electropercussive welding is so intensely local that no more than a film of metal is affected. Extremely intimate contact is secured in the film, so that the union is satisfactory, but the thickness of weld metal is so small that it makes no appreciable difference whether it be soft, hard, or even a brittle alloy. The whole thickness of metal heated to any considerable degree is of the order of two or three-thousandths of an inch. Practically, the method gives cold welding with all the advantages and none of the disadvantages of autogenous welding at the actual joint.

In its most successful form the electropercussive welding machine is built as a miniature pile driver (fig. 18), the "monkey" being the moving contact jaw carrying one of the pieces to be welded. Welding can be done at a distance (50 ft. or more if necessary) from the condenser and charging generator. Pre-eminently, the method is useful for welding small wires (1-16 in. diameter or less) together or on to plates; for attaching platinum contacts to screws and springs; for building thermo-couples and other light work which cannot be done easily or at all by other means. If found desirable, the method can doubtless be extended to heavier applications.

Light load losses in the condenser charging set constitute the chief item of power expenditure. Some tens of kilowatts may be operative in the weld at the moment of discharge, but as the discharge lasts somewhere about one-thousandth of a second the effect produced is absolutely local, and the actual energy consumption is almost negligible; conduction and radiation losses are nil. An application of particular interest and importance to the electrical engineer is the welding of copper to aluminium—whether in field coil leads or strand by strand in cables; in the latter event, a copper insert suitably protected against electrolysis, forms an excellent method of interconnecting two aluminium lines.

(To be continued.)

A LABORATORY FOR RESEARCH ON HEATING AND VENTILATION.

WHILST the lighting of buildings has received a vast amount of attention, and has given rise to innumerable researches, the allied subjects of heating and ventilation in relation to the well-being of the inmates of public and private buildings have notoriously been neglected, even by architects, who, we should think, of all professional men, ought to have studied exhaustively matters of so great and personal moment to their clients. Only within quite recent years, as we pointed out not long ago, has this wide

FIG. 1.—APPARATUS FOR MEASURING THE TRUE TEMPERATURE OF THE AIR.

field for investigation been invaded with the aid of scientific method, and there are still very few workers engaged in the assault upon these admittedly difficult problems, although the results already obtained are so interesting and unexpected that they should attract the attention of all who are concerned with the erection of buildings, and the manufacture of the appliances used for heating and ventilating them.

FIG. 3.—APPARATUS FOR MEASURING RADIATION TEMPERATURE.

In our issue of December 17th we published an abstract of an address delivered at University College by Prof. A. H. Barker, one of the few investigators who have tackled the subject with determination and enthusiasm, and we were recently privileged to pay a visit to his laboratory and to be initiated into the

mysteries of the science which he has made his own. The laboratory is situated close to University College, Gower Street, no room being available within the precincts, but in all probability accommodation will eventually be provided at the College itself, for the value and importance of the investigations which have been carried on in the temporary laboratory, under very great difficulties, have been appreciated by the authorities; in fact, a new department of heating and ventilation has been created as the direct outcome of this work, and Prof. Barker has

FIG. 2.—APPARATUS FOR MEASURING CONVECTION AND RADIATION.

been appointed the first lecturer, as was his due. The Institution of Heating Engineers has given valuable support to the new departure by supplying research students and in other ways.

In the address above mentioned, Mr. Barker explained how he had succeeded in separating the apparent temperature of the air in a room, as indicated by a thermometer, into two component parts—one, the *true* temperature of the air, the other the effect of radiation to the thermometer from the walls and furniture of the room. The problem was one of exceptional difficulty, but has now been thoroughly analysed and solved, with the aid of instruments devised by Mr. Barker for the purpose.

In the first place, the true temperature of the air is ascertained by varying the temperature of a column of air in a vertical tube by means of a water-jacket until the density of the air inside the tube is the same as that of the room; when this is not the case, the air in the tube will either rise or fall, and to detect the existence of such a current a delicately suspended diaphragm, nearly filling the top of the tube, was employed (fig. 1). When all is steady, and the detector shows that there is no current of air up or down, the temperature of the air inside the tube as read by a specially calibrated and shielded thermometer is the true temperature of the air in the room.

To determine the "radiant temperature" a somewhat similar apparatus is used (fig. 3), but in this case the temperature of the water-jacket is raised or lowered as may be necessary, with continual stirring, until the reading of a thermometer within it is the same as that of a thermometer suspended in the surrounding air, when the temperature of the jacket

FIG. 4.—THERMOPILE FIXED ON WALL; RADIATOR MOUNTED ON CRADLE.

water represents the average temperature of the surfaces radiating heat to the thermometer; obviously this measurement is affected by the position of the external thermometer with regard to its surroundings, when the latter are not at a uniform temperature—near a cold window, for instance, the mean radiant temperature will be lowered—and this effect has been carefully studied. An approximation to the true air temperature can be obtained by surrounding a thermometer with a specially designed vacuum jacket on the Thermos principle, which cuts off practically all radiant heat, and this has greatly simplified the work. Experiments are now in progress with a view to obtaining an equally simple means of arriving at the radiant temperature, by the use of thermometers with large bulbs, which are warmed up and then allowed to cool, the rate of cooling being a function, *inter alia*, of the amount of radiation.

An elaborate investigation of the conditions obtaining in the House of Commons, one of the most

FIG. 5.—METHOD OF MEASURING CONVECTED HEAT.

adequately heated and ventilated chambers in the world, but a very uncomfortable one nevertheless, was performed by Prof. Leonard Hill and Mr. Barker with water-jacketed apparatus of the type above described, and their recommendations were on the point of being carried out when the outbreak of war necessitated the postponement of the work.

The bearing of such investigations on the design and application of electric radiators was explained in the address to which we have referred; briefly, it was shown that for occasional use a radiator was preferable to a convector, and that with radiant heat supplied, the occupants of the room might be per-

necessary to draw air gently through the flue with an electric fan. To measure the rate of flow of the air, a grid of resistance wires was fixed in the flue and supplied with sufficient electrical energy at a known rate to keep its temperature slightly above that of the air current. The arrangement is indicated diagrammatically in fig. 5. By measuring the temperature of the air below and above the grid, knowing the specific heat of the air and the rate of dissipation of energy by the grid, the rate of flow of the air could be accurately determined, and the amount of heat energy which it received from the radiator could then be ascertained, the true temperature of the surrounding air being known.

To measure the heat radiated in any given direction, an iron bar bent to the arc of a quadrant was fixed with the radiator at its centre, and a movable device for measuring the radiant heat was attached to the arc, as in fig. 2, thus giving readings at all angles in a vertical plane through the radiator; by shifting the arc round the radiator, the radiation at a series of angles in other vertical planes could similarly be measured, and the result was a map of the space surrounding the radiator, showing the intensity of the radiant heat at points on the surface of a sphere of five feet radius—a distance taken as standard in these investigations. The radiation detector first used consisted of an absorber one square foot in area, composed of blackened coils of metal tubing through which water flowed; the temperature of the water at inlet and outlet being measured, and the rate of flow being known, the amount of heat absorbed per second could be determined. This, however, proved to be an excessively tedious and cumbersome method of test, and has been replaced by an electrical method. A thermopile was standardised and substituted for the absorber, and in conjunction with a galvanometer has given the greatest satisfaction as a radiation measuring device. Moreover, to avoid the necessity of moving the thermopile about the radiator, a cradle was made for the latter, by means of which it was made possible to explore the field of radiation whilst keeping the thermopile fixed (fig. 4). Thus a very great improvement in method was achieved. The thermopile was cali-

FIG. 8.—LATERAL DISTRIBUTION OF RADIATION (AT ANGLES OF 18°, 0°, AND 54° WITH THE HORIZONTAL PLANE).

flectly comfortable although the "temperature of the room," as indicated by a thermometer, was even below 50° Fahrenheit. In connection with this subject Prof. Barker undertook an investigation of the performance of electric radiators, by measuring the amounts of heat evolved respectively by radiation and by convection. This research involved the construction of a variety of special apparatus.

In order to capture all the hot air rising from the heating apparatus, a kind of hood, or cowl, was devised, in the shape of a well-lagged pyramid, to the apex of which a flue was attached (fig. 2); to ensure that no eddies should escape capture, it was found

brated to give watts per square foot at five feet radius. Unfortunately it is not possible to rock gas radiators about so freely as electric radiators, and consequently the former have to be tested by moving the thermopile and not the radiator.

By means of these arrangements Mr. Barker has been able to account for the whole of the heat developed by a radiator, within two or three per cent., in spite of the obvious difficulties of the work. Many types of electric radiator have been tested exhaustively, and we are indebted to Mr. Barker for the examples of plotting illustrated herewith, as well as for the photographs from which we have reproduced

illustrations of his equipment. The latter includes a recording ammeter, and an ingenious attachment to the pointers of an Aron meter to give a closer record of the amount of energy consumed at a given moment than could be read directly from the dials.

In the foregoing account we have only dealt with a portion of the resources of this laboratory, which is equipped also for testing gas and coal fires, a thermostatic arrangement for keeping the temperature of the room constant for long periods, means for testing hot-water radiators and pipes, instruments inserted at various depths in an external wall to obtain the temperature gradient in the body of the wall, an isolated section of the wall provided with a water-jacket and electrical means for determining the rate of loss of heat through it, and a series of wires stretched upon a wall for the purpose of heating the wall electrically for experimental purposes. A system of gauges to show the pressures at various points in a hot-water pipe system, and a micrometer gauging device to measure the rate of flow of water under low heads, have also been devised by Mr. Barker, as well as an elaborate and very sensitive apparatus based upon the principle of the Wheatstone bridge for measuring the resistance of air ducts, cowls, etc., in terms of definite units. With these our readers are less concerned than with the apparatus described above, but we have said enough to show that the subjects of heating and ventilation are now being dealt with in a manner which promises to elucidate many of the problems with which all civilised peoples are so intimately concerned; and we are glad to record that a British University and a British scientist are the first, we believe, to embark upon the study of these important matters.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The I.E.E. and Alien Enemy Members.

The "Six Borough Electrical Engineers," in their statement of last week, have most ably voiced the feelings of, I am sure, the majority of the members of the I.E.E. on the above subject.

It now only remains for a definite movement to be set on foot to give effect to the principles enunciated, and I would suggest that the six engineers should consent to receive the names of others who are in sympathy with them with a view to supporting a formal notice to the Council, asking for an extraordinary general meeting to be called to deal with the matter.

If members in the various local centres would act simultaneously the whole question could be settled in a very short time. I enclose my card and remain, for the moment,

Alien-ate(r).

I was pleased to see, in last week's issue, the very ably-written letter signed by "Six Borough Electrical Engineers," and to see that irrespective of the "hidden hand influence," which exists, and which has used every endeavour to prevent any action being taken towards the exclusion of members of alien enemy origin, whether naturalised or not, certain members of the Institution do not intend to allow the matter to rest.

As a contrast, one sees from the statement of the President of the Institution that the Council has appointed a committee of Vice-Presidents to consider this question, and still maintains that Article 41 gives it power to deal with it, but that no ten members have yet brought forward a definite charge against any corporate member of the Institution.

It has previously been pointed out that under Clause 80 the Council could have called a general meeting of the Institution members to consider whether any alteration in the by-laws should be made so as to exclude all corporate members who were of alien enemy origin. From the fact of its not having done so, it is clear it is not desirous that these people should be excluded, and, according to information which I have from time to time gathered from people interested in the movement, or who have acted on behalf of associations who have communicated with the Secretary on this point,

there is a great lack of sympathy shown, whilst no assistance is afforded at all. There is, further, a rumour that a petition for a deputation and general meeting has been received, but I do not see any public announcement of it.

It is a well-known fact that the Council of the Institution dare not take a plebiscite of the members by ballot through the post on this point, for it knows full well the decision would be whole-hearted exclusion of all alien enemy members, whether naturalised or not.

I think it is viewed, should a general meeting be forced on the Institution, that the movement for the exclusion of such alien enemy members may be killed, either by reason of the lack of members, or the fact that the members then present will be marked men for the future, and, if in commercial houses, their positions may be jeopardised, which would not be the case if a plebiscite were taken.

To think that an institution like the Institution of Electrical Engineers has failed so much in showing a patriotic spirit is, I think, a severe reflection upon its membership. I can only recommend each member of the Council, when considering the exclusion of such members as may be thought worthy of its consideration under Clause 41, personally to read (as the writer has done) the *Appendix to the Report of the Committee on alleged German Outrages presented to Parliament by command of His Majesty, Cd. 7895*; price 1s. 9d. This, I believe, is expurgated, inasmuch as the more revolting and disgusting outrages are not therein referred to (if we can conceive such). I trust that, after having done this, they will realise that the outrages have been committed and authorised by a class of people essentially of the professional class, and of a class equivalent or superior to those members of the Institution referred to, and, further, have been committed by people of the same generation.

I trust, in conclusion, that members will refrain from paying their subscriptions until some definite attitude has been adopted by the Institution, and that the members, as a whole, will have every opportunity of deciding for themselves whether such a policy is right or not, and that such decision will be made in such a manner that they may, without fear of jeopardising their positions, do so.

Station Engineer.

The Problem of the "Point-Five" Tariff.

I have been interested in your communicated article dealing with the above in your issues for October 1st and 8th last. The article is mainly a criticism of the Norwich rating tariff system, also in use in conjunction with the "Point-five" tariff. One would have liked to see a criticism of the equity and the financial soundness of the "Point-five" tariff, and also an alternative to the Norwich system. It is true some suggestion was made that a more consistent system would be one in which the fixed charge was based on an estimated maximum demand. This seems likely, however, to have many of the defects that the Norwich system has.

With many others, I have always held the view that the Norwich system was a very crude approximation; in fact, one might as well base the fixed charge on a man's wages or income as on the rating of his house. To base the fixed charge on the actual maximum demand is no doubt the soundest and most consistent method, and the many critics of the "Point-five" enthusiasts would, of course, require that this maximum demand should be based on the total demands for lighting, heating, and cooking combined.

In Australia, owing to the comparatively mild climate and the disadvantages of cooking by ordinary methods during our hot summer months, electricity for heating and cooking should have a particularly good field. Notwithstanding this, there are, I believe, few, if any, engineers out here who favour, or believe in the financial soundness of, the "Point-five" tariff, or a figure in the neighbourhood of this, as a means for tapping this demand. The recent revelations from those undertakings which have had some experience of the "Point-five" tariff will hardly help to advance this system.

Radiators are greatly on the increase in many Australian undertakings, and, although they are only used during a few months of the year, still they have in many cases a better load factor than cooking would have. They have shown, however, that they create a distinct peak of their own, and it is questionable whether they are a payable proposition at prices per unit very considerably higher than the "Point-five" tariff.

The effect of the "Point-five" tariff on the stability of an undertaking can only be judged when the demand has reached large proportions. In the many cases quoted, the units sold on this system bear such a small proportion to the whole that their effect on the peak, and on the capacity of the mains and power station, is but small.

With a tariff in the neighbourhood of the "Point-five," coupled with satisfactory heating and cooking appliances, it is pretty safe to assume that in many of the undertakings at home, lighting, and even power supply, will be altogether secondary to heating and cooking. Those undertakings in which motive power does not predominate must, when this time arrives, find their peak load very seriously affected by the heating and cooking load which is superimposed on their lighting. Where power load predominates, many undertakings find that their peak is in the neighbourhood of noon, and the mid-day heating and cooking load, when fully ad-

vanced, must in consequence create a very decided and important peak of its own.

In your communicated article it would have been interesting to see some consideration given to the Norwich system coupled with the introduction of the half-watt lamp. It has been stated that those who have adopted a fixed-charge system, such as the Norwich, will be in a much better position to face the problem that arises from the introduction of the half-watt lamp than those who have a tariff of a certain price per unit without a fixed charge. This is very questionable. Take the Norwich system coupled with the "Point-five" tariff, and assume that the fixed charge, plus $\frac{1}{2}$ d. per unit, is equivalent to 1d. per unit for lighting. If we assume, for argument, that the half-watt lamp halves the consumption, which, fortunately, at present it does not, then on the above tariff the consumer would be paying for his lighting on the equivalent of $\frac{1}{2}$ d. per unit. Those consumers who have not changed over to the Norwich system, such as shops, public buildings, etc., who cannot very well be offered the Norwich system, would, instead of paying the 4d. per unit, be getting their lighting on the equivalent of 2d. per unit. It would, therefore, pay many consumers where cooking and heating units are not a very large item to discard the Norwich system and demand any heating or cooking power they require on the ordinary rates. A great inconsistency would ensue; in fact, very unfair preference might be claimed. Why, for instance, should the shop and many public buildings, who are among our most unremunerative consumers, get their lighting at the equivalent of 2d. per unit, and the private house, which is one of our best consumers, owing to its higher load factor, be charged at the equivalent of $\frac{3}{2}$ d.?

The fixed-rate system with a much higher price per unit would lessen some of the above defects, but where would the "Point-five" tariff be?

The war has, no doubt, delayed the advance of the half-watt lamp, but it is to-day an important factor for shops and public buildings lighting, where the larger units can be employed. It is, however, only a question of time when the same will occur in the case of private house lighting, and then the Norwich system will be faced with many of the same difficulties that other tariffs will have to consider.

The half-watt lamp is bound again to raise the standard of lighting in the same way, but hardly to the same extent, as the metallic-filament lamp did, but this will in all probability not be the case with the majority of our private house consumers. The 16-c.p. standard of carbon-lamp days was, in very many cases, too low, and has been replaced by the 50-c.p. standard. It is hardly conceivable in the case of the majority of private houses, except where indirect or semi-indirect lighting is introduced, that the standard will be raised much beyond 50 c.p. Some alteration in the tariff, to meet the problem which must result from the introduction of the half-watt lamp, seems inevitable, particularly so in those undertakings which to a great extent depend upon lighting for their revenue. Already undertakings are feeling the effect of the half-watt lamp in the case of shops and public buildings, etc. Fortunately private houses, the mainstay of many undertakings, will be little affected in the meantime.

I throw out a suggestion, a crude one, as a result of the above position. Where a shop or public building has the whole of its lighting changed over to half-watt lamps, the ordinary tariffs should be increased by some percentage, say, for argument, 40 per cent. If such a consumer is using high-candle-power units, then his tariff would have to be doubled to bring in the same revenue. The above suggestion would, therefore, concede him 60 per cent. of the advantage, the supply undertaking retaining 40 per cent. If only 75 per cent. of the candle-power installed was with half-watt lamps, then the increase in the tariff would be 30 per cent., and on the same basis 50 per cent., and 25 per cent. would increase the tariff 20 per cent. and 10 per cent. respectively. There would, of course, be some difficulty in checking the above, and when you come to private houses it would be much greater. Perhaps, however, by the time the private-house problem has to be met there will be other solutions of the difficulty. The proposal, I know, is a crude one, and has objections. I simply throw it out in the hope that it may lead to further consideration and discussion of the problem and, perhaps, some solution.

P. J. Pringle.

Ballarat, Victoria, December 9th, 1915.

[We may point out that in this country the supply authority is forbidden by law to place any restriction on the type of consuming device adopted by its customers. We have grave doubt as to the practicability of the proposal contained in Mr. Pringle's last paragraph.—Eds. *ELEC. REV.*]

["Crane" is reminded that letters unaccompanied by the name and address of the writer are not accepted for publication.—Eds. *ELEC. REV.*]

Russian Chamber of Commerce in London.—The Foreign Office announces that the organisation styled "The Russian Chamber of Commerce in London" has not obtained the recognition or approval of either His Majesty's Government or the Imperial Russian Government.

THE PREDETERMINATION OF THE PERFORMANCE OF DYNAMO-ELECTRIC MACHINERY.

PROF. MILES WALKER'S paper was discussed by the MANCHESTER LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS on January 11th.

MR. L. A. H. CARR said regarding leakage that the author's method seemed rather complicated. The speaker had found it possible in practice to calculate leakage by means of a formula containing only two terms, the first being proportional to the core lengths (a different constant being used accordingly as for a rotor slot were more or less than the stator slots) and the second giving the end leakage. This method worked well in practice, and the determination of the two constants for any given line of motors was fairly simple. The core loss curves in the paper called for some criticism. Some years ago he had carried out a series of experiments on core losses, and it was found that for a given periodicity and flux density the core loss in a D.C. machine was about double that in an A.C. machine. Regarding the "tailing-off" at the upper end of the curves, he had observed this effect in asynchronous machines with cylindrical rotors. It did not occur, however, in D.C. machines, even with extremely high apparent tooth densities, the curves taking in fact an increased upward tendency. The equation for watts dissipated from a cylindrical surface seemed much too high for an induction motor, but gave good results for D.C. machines with relatively large air spaces between the salient poles. He gave figures to disprove the possibility of getting enough air through a narrow induction-motor air-gap in order to dissipate the quantity of heat mentioned.

MR. JULIUS FARRIS said the current loading was surely quite as important as the flux loading, also the ratio of flux loading to current loading. The method of taking the maximum induction in the air-space and multiplying it by the maximum possible area of the air-space in order to get a fictitious large flux was not inviting. In reference to Mr. Field's work, a Manchester paper (*Journal, I.E.E.*, Vol. 37, page 101), gave very good curves showing the increased ohmic resistance due to the current being forced outwards in the slot conductors. The four curves showing iron losses at different frequencies could, with sufficient accuracy, be combined into one curve by plotting watts per cubic centimetre against the product of induction and frequency.

MR. JUELIN from personal experience testified to the ease with which a designer could lay out machines and get a clear grasp of the factors involved, using the method outlined by Prof. Walker; after using it for some time, it was exceedingly quick. Prof. Walker had stated that it was hardly worth while to calculate the iron losses accurately; it seemed, however, that without some fairly accurate idea of the iron losses it was impossible to deal with one of the main headings, namely, temperature rise, and, in his opinion, it was desirable to allocate the loss to different parts of the magnetic circuit. The curves in the paper appeared to give a result which was altogether too low. The losses in a finished machine did not by any means lie in the lamination, as pointed out by the author. A great part of these losses would be found in the iron structure supporting the laminations and also in the copper, especially in direct-current machines at high densities. The loss was probably much higher in D.C. machines than would be calculated using the author's curves. It would also seem necessary to discriminate between the losses in induction motors and turbo-alternators, and the field for investigation in this work was very great indeed. The eddy-current losses increased very rapidly with the working of the iron. For example, in turbo-alternators there was a big mass of unworked iron, whereas in induction motors with a large number of slots the worked surface was considerable, and the losses were consequently high. The same remarks applied to direct-current machines.

MR. R. E. GRIME said that a special sheet for each type of machine would be preferable; three such sheets would fulfil most purposes. The author had given prime importance to what might be described as "frame constants," i.e., the idealised total magnetic flux ϕ crossing the air-gap A_p , and the total ampere-turns $I_a Z_a$; the speaker entered a plea for the utility of specific magnetic and electrical loadings, especially in preliminary calculations. The specific magnetic loading was the average air-gap induction round the whole machine; denoting this by B_m it equalled $2 \pi \phi / 2 \pi r l$. The specific electric loading equalled $(I_a Z_a / \text{circumference})$, and was often denoted by q . These two quantities had the great advantage that for a given type of machine they remained sufficiently constant over a wide range of frame sizes. After some experience with these constants a designer could usually estimate what values to aim at, and make the constants the basis of the first tentative design. The output coefficient given by the $D^2 l$ formula on design sheets always appeared rather a blind way of estimating what use was being made of available space and material. This coefficient was inversely proportional to the product $B_m \times q$. For example, in a continuous-current machine, after allowing for internal resistance drop the $D^2 l$ formula might be written $KW/B.P.M. = D^2 l \times B_m \times q \times \pi^2 / 6 \times 10^{12}$. This expression, which was quite familiar, merely brought out the fact that whereas the ordinary output coefficient was often used to indicate that it was possible to put a given output into certain dimensions, if this coefficient was replaced by the two quantities B_m and q , the designer would see at once how it was possible to get it into those dimensions. It was obvious that the air-gap induction B_m might be used instead of the average value at the discretion of the designer, as the author's field-form coefficient K_f was simply the ratio of these

two quantities, i.e., $R_{st} = K\Delta$. The product $\eta\Delta$ of specific electric loading by current density in armature copper often gave a very close idea of the temperature rise of standard machines; it was something more than an empirical rule, as it was proportional to the copper loss per cm. of air-gap area, and also in the case of a barrel winding, per cm.² of end-connection cooling surface. Thus for a given continuous-current frame of practically constant flux a curve could be plotted showing the relation between the permissible value of the product $\eta\Delta$ and the peripheral speed, and over quite a wide range of frame sizes this curve remained practically the same. In a line of standard machines of one type, therefore, such a curve, when once determined, gave instantly a fairly close indication of the current density to be employed in connection with any proposed value of the specific current loading. The observed total iron loss was usually considerably higher than that indicated by the curves. In induction motors and alternators the losses generally increased approximately as the square of the total flux, while in D.C. machines the index was usually 2.5 to 2.8, or even higher, at a very high tooth induction. The difficulties in the way of forming a reliable estimate of the extra losses were so great, especially in view of the large difference produced by small shop variations, that the allowance for them must remain mainly empirical. The stray losses, which were dependent upon the load, were mainly accounted for by (a) eddy-current losses in the conductors embedded in the slots, and (b) additional iron loss due to distortion of field-form by armature reaction. In the armature conductors of D.C. machines, owing to the almost rectangular shape of the current wave form, the effective increase in resistance was considerably greater than when the same conductor carried a sinusoidal alternating current. The curve A.C. in the accompanying figure gave the mean coefficient of increase of resistance for the top and bottom conductors of an ordinary barrel winding carrying a sinusoidal current; the curve D.C. showed the corresponding effect in a normal D.C. winding.

EQUIVALENT INCREASE OF RESISTANCE OF EMBEDDED COPPER OF STANDARD TWO-LAYER WINDING.

λ = coefficient of increase of resistance (mean of top and bottom conductors).
 $X = 0.14 \times$ depth of conductor in cm.

$\times 4/\text{frequency} \times \text{width of conductors, total} / \text{width of slot}$
 for copper at 60° C.

For simplicity the curves showed only the mean increase in top and bottom conductors, assuming these to be identical in size. The stray iron losses on load were not so amenable to calculation, owing to the awkward shape of the field-form. It was possible, however, by ignoring the field-form altogether, and simply considering the maximum induction under the trailing-pole tips (of a generator) to arrive quickly at a result which was, at least, of the right order of magnitude.

MR. R. TOWNSEND said that after 10 years' experience of Prof. Walker's method he preferred it to the method generally adopted. The constant K , might seem rather complicated, but after a little use it was quite simple, and once obtained for a given frame it was practically constant irrespective of the number of slots per pole. The great advantage of using the constant was that it conveyed so much meaning in one figure and showed at a glance whether the best results were being obtained from any particular design of frame. The adoption of one calculation sheet for all machines was not desirable. For example, if a designer had been working on alternator designs for some time and suddenly turned to D.C. machines, it was quite easy to overlook the fact that in one case a certain portion of the tooth depth had to be added to the armature diameter, and in the other a certain portion had to be subtracted. A separate type of design sheet would certainly tend to prevent mistakes of this kind; in fact, sheets having a different colour would be preferable.

MR. W. E. M. AYRES said he had found it very useful, in the calculation of the magnetising current for induction motors, to plot curves for the magnetising current in terms of the air-gap

plotted against flux densities for different parts of the magnetic circuit. Regarding the curves for iron losses which, presumably, were for A.C. machinery, he had not found the actual losses tapering off so much at high densities. The use of the same curves for losses in teeth and core was frequently insufficiently accurate owing to the fact that the core was usually substantially unworked iron, while round the slot was considerably worked iron. The estimation of the heating of induction motors was a very complicated matter. Cases had been observed where a reduction of rotor losses had resulted in cooler stator iron, although the stator iron losses had increased. The heating of the stator could be considerably modified by taking the heat away from the end connections in an efficient manner. Taking the ampere wires per unit length of periphery as the current loading, and air-gap flux density per unit area as the magnetic loading for any machine, the product of these values multiplied by D^2L was a measure of the output, and a glance at such figures was sufficient to indicate to an experienced person how the machine was loaded.

PROF. MILES WALKER, in a brief reply, said that he did not agree with Mr. Carr's suggestion regarding the correct method of calculating the leakage of induction motor. The calculation should be made as simple as possible, but the designer should have before him the principal factors which determined the amount of leakage. The iron loss curves, which had been subjected to considerable criticism, were intended to represent the legitimate iron losses. Reasons were given in the paper why some of the so-called iron losses were actually higher in practice, but the author did not consider it right to accept these additional losses as something inevitable and put them into the curves for general application. The correct procedure was to give curves for the legitimate iron losses, and if there was a legitimate loss, say due to eddy currents in conductors occurring when the teeth became saturated, a separate small formula should be employed to take care of it. He was quite sure that the legitimate iron losses would follow a curve as given in the paper. The author agreed that the teeth and core losses should be separated and the individual curves plotted. The importance of the iron losses was enormously great, and the temperature rise of a machine could not be estimated without a fair knowledge of these losses. For some reasons it was probably better to adopt separate design sheets, but it was well to have one general method of design.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Glass Wool.

Amongst the new industries that have been established within our borders as a result of the war, is the manufacture of glass wool. This useful substance is now made in London with British labour by the BRITISH GLASS WOOL CO., 134A, Holloway Road, London, N.; moreover, it is not made under foreign patents, but by an electrical method invented and developed by the firm, and the product is so fine, soft and brilliant that it can hardly be distinguished in appearance from silk—it is difficult to realise that it consists of glass. Makers of cookers, electric furnaces, portable accumulators and similar articles will no doubt be interested in the material, and we should think that many other classes of manufacturer would find it useful.

Salt-Water Leakage In Surface Condensers.

When salt water is used for circulating purposes in connection with surface condensers, there is always the possibility of contaminating the condensate because of leakage of the condenser tubes or packing. This leakage is usually detected by chemical tests of the condensate. The following electrical method of determining leakage has as its basis the measurement of the potential drop in a circuit. Referring to the illustration, an ordinary spark plug is screwed into the condensate pipe as near

FIG. 1.—CIRCUITS TO MEASURE POTENTIAL DROP ACROSS GAP OF SPARK PLUG.

the base or hot-well of the condenser as possible. Across the two leads to this spark plug a voltmeter is connected, and an ammeter is placed in the circuit as shown. Assuming no leakage, pure water will flow across the gap of the spark plug and offer a high resistance to the flow of the current. This condition results in a

high potential drop across the gap. As leakage occurs the resistance decreases, and the drop becomes less also, affecting the flow of current.

By a little experimentation the resistance of various states of the water from pure to rank contamination may be computed by Ohm's law and the results recorded. In actual operation the oiler may read the instruments and record the data on his log sheets. When these are turned in, it requires but a few minutes' work to determine the condition of the condenser as regards leakage.—*Electrical World*.

An X-Ray Portable Power Plant.

It is probably safe to say that at no time since its first application to medical science has the X-ray played so important a part as it is doing at the present time in connection with the work of saving the lives of wounded soldiers, who, but for the prompt diagnosis it permits, would succumb to their wounds. Not only are all the military hospitals equipped with such apparatus, but a large number of travelling hospitals in the form of specially-designed motor vehicles are also being used near the field of battle by the Medical Service of the Army. One of the needs that the war early brought about in connection with the use of the X-ray was that of a portable power plant which could be quickly installed either in a motor vehicle or in hospitals not

FIG. 2.—SECTIONAL VIEW OF AUSTIN PORTABLE POWER PLANT.

provided with a source of electrical energy, and we are this week able to illustrate the compact little set which the AUSTIN MOTOR CO., LTD., of Northfield, Birmingham, specially designed for this work, and of which they have supplied a large number to the Director-General of Army Medical Service.

The set, which is exceedingly compact, occupying a space of only 3 ft. by 2 ft. by 3 ft., comprises a single-cylinder petrol engine

FIG. 3.—AUSTIN X-RAY PORTABLE POWER PLANT.

developing $1\frac{1}{2}$ H.P. at a speed of 1,300 R.P.M. radiator, silencer, petrol tank, dynamo and switchbox, the whole, for portable purposes, being enclosed in a wooden box provided with carrying handles and also with a receptacle for the necessary tools.

So far as the engine, which has a bore and stroke of $2\frac{1}{2} \times 3$ in., is concerned, this calls for no special description beyond that its crank case, which is of aluminium, is formed in one with the dynamo bed-plate so constituting a rigid bed. The ignition is by high-tension magneto, and the lubrication by pump circulation; the cylinder is provided with a water-jacket, the water, which is circulated by a pump, being carried in a small tank above the engine; for cooling purposes an ingenious form of radiator is employed; this consisting of six sections or disks embracing a rotary fan fixed to the flywheel. The petrol tank, which is centrally located above the radiator, has a capacity of one gallon, which is stated to be sufficient for a continuous run of about seven hours.

The dynamo or generator is of the reverse compound-wound type, having an output of 10 amperes at 70 volts, and is directly driven by the engine. The latter is put in operation by means of a pulley on the rear end of the dynamo spindle, the necessary initial impetus being given by a strap working on the pulley. The engine is fitted with a centrifugal governor which acts on the throttle valve in the carburettor; by means of a knurled nut and an adjustable spring the engine speed can be varied between wide limits.

The switchgear, which is entirely enclosed in an aluminium case mounted above the dynamo, is of the rotary type and furnished with outside operating handles; it is arranged to give any of the following combinations:—(1) off position; (2) battery to X-ray coil; (3) battery charging, and dynamo and battery in parallel to X-ray coil; (4) dynamo and X-ray coil only; (5) battery and dynamo in series to X-ray coil. The voltages to the coil are approximately:—No. 2 position, 36 volts; No. 3 position, 36-45 volts; No. 4 position, 75 volts; and No. 5 position, 110 volts.

Simplex Reflectors.

MESSES, SIMPLEX CONDUITS, LTD., of Garrison Lane, Birmingham, have introduced a new reflector, known as the "Anti-Zeppelin," made in enamelled steel, with a special diffusing reflecting surface inside. These are made in two types, "Extensive" and "Intensive," which terms define the light distribution, and are designed for both half-watt and ordinary metal filament lamps. The half-

FIG. 4.—ANTI-ZEPPELIN "INTENSIVE" REFLECTOR.

watt reflector is fitted with a tube, screwed $\frac{1}{8}$ in. brass, of suitable length for 100-150-200-watt lamps. Upon removing this tube, the reflector is suitable for a Goliath holder for 300-watt lamps.

For ordinary metal filament lamps, the reflector is made with a $1\frac{1}{4}$ in. hole for attaching to the shade carrier holder; a special watertight holder can be supplied for outdoor use of these reflectors.

These "Anti-Zeppelin" reflectors are described in list No. 614, which also illustrates Simplex lanterns for half-watt lamps up to 1,500-watt size.

The "Overseas" Rectifier.

THE OVERSEAS ENGINEERING CO., LTD., of 75, Curtain Road, E.C., have introduced a patent electrolytic rectifier, principally for charging accumulators, for medical and X-ray work, electro-plating and running small motors. These are standardised for use up to 150 volts, above which pressure an auto-transformer is employed.

The rectifiers are constructed in four sizes for from 2 to 10 amps., the two smaller sizes consisting of a single earthenware cell, with a central anode in solution, while the two larger sizes are four cell rectifiers designed for continuous work and of heavier make.

The A.C. mains are connected direct with terminals on the apparatus, and the charging rate is regulated by means of carbon-

filament lamps mounted on the rectifier itself for the 2 amp. size, and on a separate base for larger sizes; no charging board, resist-

FIG. 5.—SMALL ELECTROLYTIC RECTIFIER.

ances or measuring instruments are necessary so that the cost of the installation is low.

Fig. 5 shows a small rectifier of this type.

Electrically-Operated Air-Regulating Device for Diesel Engines.

A substantial improvement in the operation of Diesel engines is obtained by regulating the pressure of the air which blows the fuel into the cylinder according to the amount of fuel blown in, the latter varying with the load. Such regulation is usually carried out by hand, demanding considerable attention on the part of the engine driver.

MESSERS. MIRRELES, BICKERTON & DAY, LTD., of Hazel Grove, Stockport, have, however, now introduced an automatic apparatus to obtain the desired result, which is made for either mechanical or electrical control, a description of the latter type being as follows:—

Referring to fig. 6. In this the current from the dynamo is passed round the coil (a) in such a way that this controls the finger (b) exactly as the finger of an ammeter is controlled by the current flowing through the ammeter. The finger, however, instead of pointing to ampere readings, is arranged to move round the scale of a pressure gauge, and point to that blast pressure which is best for the engine for the amount of power being generated at the moment.

FIG. 6.—AIR-REGULATING DEVICE FOR DIESEL ENGINES.

rated at the moment. The pressure gauge shown is connected up with the blast pipe, consequently its finger (c) points to the blast pressure. Both fingers are provided with contact pieces (d) and (e) shown in detail in the small figure. The two fingers are insulated from each other, but are connected up with an electricity supply. The amount of current used is very small, therefore the fingers can if necessary be connected to a battery. The supply is also connected

with the solenoid (g) in which the plunger (h) works. This plunger is connected with the stem of the air compressor throttle valve (j). Normally this throttle valve would be wide open and admit a full supply of air to the air compressor, in which case the pressure in the blast receiver would with any load on the engine rise rapidly, as the air compressors are always made with a substantial margin of capacity.

Supposing now that the engine is at work and that the pressure in the air receiver is lower than that indicated by the finger (b) as being the proper pressure for the load, the air compressor would pump at its full capacity into the receiver and rapidly increase the pressure, so causing the finger (c) to catch up to the finger (b) and make contact between the contact points (d) and (e). As soon as this occurs, current will flow through the solenoid (g) and the plunger will be drawn downwards into the solenoid, thus closing the throttle valve, and this valve will be held closed whilst the two fingers remain in contact. As soon as the pressure drops a little and the gauge finger (c) falls away from contact with the finger (b), then the circuit will be broken and the throttle valve will re-open. In this manner the pressure in the air receiver will be automatically regulated in accordance with the load on the engine.

The apparatus results in smoother running of the engine, less attendance, and in case of alternators run in parallel, both putting them into parallel and running them are facilitated.

Messrs. Mirreles, Bickerton & Day have also recently introduced a crosshead type of Diesel engine (which was referred to in our issue of January 28th, page 116).

This construction is more costly than the trunk piston construction, but for large engines it has particular advantages in that piston troubles are reduced and trouble with connecting rod top-end bearings is decreased; cylinder wear is also lessened and lubrication improved.

The engine height is increased, but owing to the necessity with the trunk type of allowing headroom for withdrawing both piston and connecting rod clear of the cylinder, while with the crosshead type only the piston needs to be lifted clear, the height of the engine room will not necessarily be increased.

LEGAL.

BATTERIES FROM HOLLAND.

BEFORE the Recorder (Sir Forrest Fulton, K.C.) and a jury, in the Lord Mayor's Court, on January 27th, Mr. Isidore Grunhaus, fancy goods importer, of 142 and 145, Houndsditch, E.C., sought to recover the sum of £36 13s. 6d., the price paid for goods which were defective, and loss of profit on their sale, from Mr. A. Franco, importer, of 10, Clothier Street, Houndsditch, E.C.

Mr. E. Zeitlyn was counsel for the plaintiff, while the defendant was represented by Mr. C. J. Conway.

It was stated that in January of last year the defendant, who then had business in Holland, called on the plaintiff and asked him to store a number of dry batteries used in flash lamps. The defendant said that if the plaintiff could find a customer for the batteries he would sell them at 4½d. each. Some days later the plaintiff received an offer for the goods, and he wrote to the defendant at the Victoria Hotel, Amsterdam, offering to purchase them at 4s. a dozen, less 2½ per cent. discount. The defendant telegraphed back refusing to accept anything under 4s. 3d. per dozen. Finally the plaintiff agreed to purchase the batteries at 4½d. each. He took over 4,800 batteries, received a three months' guarantee with them, and a discount of 3½ per cent. The price paid for the batteries was £31 16s. 3d. The plaintiff sold the batteries to Messrs. Rowarth Bros., of Norwich, who returned no less than 1,964 on the ground that they were defective. The plaintiff immediately informed the defendant that a large number of the batteries were "dead," and asked for others to be sent in their place. After some correspondence, defendant asked for the batteries to be returned to a firm in Amsterdam. The plaintiff, however, refused to send them back as requested, pointing out that he had dealt with the defendant, and did not know any other person in the matter.

In his evidence, the PLAINTIFF stated that he purchased the batteries at 4½d. each, and sold them at 4½d. each. The Witness said he did not have much confidence in the defendant, as he had only sprung up since the war started. He told the defendant that it was usual to have a three months' guarantee with such goods. That was the custom of the trade, although some manufacturers gave a six months' guarantee.

COUNSEL for the defence said he would not dispute that some of the batteries were defective, but that there was a guarantee given.

In cross-examination, the PLAINTIFF said that he was told by the defendant that more batteries were being sent over to replace the defective ones, but the ship in which they were consigned was sunk by the Germans. A second ship containing batteries was captured by the enemy. It was untrue that at the outset the defendant told him that the batteries were made by the Fabrik Metrom, of Amsterdam.

The DEFENDANT, who said he was a Dutchman, and formerly traded in Belgium, said that at the outset he told the plaintiff that the goods were made by a manufacturer in Holland, who would guarantee every battery. At a later date, when he actually sold the goods, he told the plaintiff who the manufacturers were.

The RECORDER said that in the receipt which the defendant gave he signed his own name to the guarantee, and the name of the manufacturer did not appear.

The JURY returned a verdict for the plaintiff for the amount claimed, and judgment was entered accordingly, with costs.

BERGTHEIL & YOUNG, LTD., v. LINDLEY.

In the King's Bench Division, on January 27th, before Mr. Justice Atkin and a special jury, an action was brought by the plaintiffs against Mr. R. H. N. Lindley, of the firm of C. Lindley & Co., Ltd., tool makers, 40, Englefield Road, London, E., to recover damages from the defendant for an alleged slander which he was said to have uttered to a representative of the plaintiff firm at his business premises. The defendant denied that he uttered the words complained of, and he said if they were uttered they were spoken on a privileged occasion and without malice and *bona fide*.

Mr. Neilson appeared for the plaintiffs, and Mr. Dale represented the defendant.

MR. NEILSON said that the plaintiffs were electrical engineers in a large way of business. The alleged slander was a very serious one, as it was spoken of the plaintiffs in regard to their trade and business. The plaintiffs were an English company carrying on business here; they had large works at Parson's Green and Stoke Newington, and the slander they complained of was to the effect that they were a German firm. The plaintiffs employed many hands, and had had a deal of Government work, and it was a matter of great importance to them to have it made generally known that they were not a German firm. The plaintiffs had a Mr. Stent in their employ, and he had occasion to go to the defendant's premises about some lathe-chucks, and it was then that the defendant uttered the words complained of. The suggestion made now by defendant was that the words he uttered were in relation to his inquiries concerning the plaintiffs and their goods. The plaintiffs' complaint was that defendant said, with reference to their name:—"They are a German firm, and we will do no business with them whatever. They are a German firm, and it is a German name." It was asserted that the words were spoken on a privileged occasion, but it was not a plea of privilege to which he (Counsel) was accustomed. The jury would appreciate the extent of the harm that might be produced upon the plaintiffs' business by such a statement as this; its effects would be incalculable, and the plaintiffs desired that the true facts should be known. His clients were not out for money, and if Mr. Dale was ready to apologise now on behalf of the defendant, his clients would be satisfied. The plaintiffs employed about 1,000 hands. The company was a limited company registered under the Joint Stock Companies Act in 1904. There were two directors only. Mr. Arthur Bergtheil and Mr. Edward Bergtheil, and all the people connected with the company were English. The father of Mr. Arthur and Mr. Edward Bergtheil died in 1901, at the age of 89. He had lived in England since 1866. He came from Bavaria as a boy, and his sons, Edward and Arthur the present directors, were born at Paddington. The father, Mr. Bergtheil, was for some years a member of the Legislative Assembly of Natal, which involved his naturalisation. The plaintiff company was therefore, an English company, and the slander was a very serious one. The name of the plaintiff company had now been altered to Berkeley & Young, with the consent of the Board of Trade.

At the close of Mr. Neilson's opening statement, MR. JUSTICE ATKIN observed that it seemed to him that the object of the plaintiff's action was achieved, as it merely desired to give publicity to the true facts concerning the plaintiffs. Under these circumstances it seemed to him that something might reasonably be done to settle the matter. He would see counsel on both sides in private consultation if it was so desired.

After a consultation in Mr. Justice Atkin's room, it was announced that the case had been settled, and that the record in the action would be withdrawn.

MR. DALE, addressing the Court, said that he wished to say on behalf of the defendant, Mr. Lindley, that he personally considered that he was justified in defending the action. There was no ground, the defendant thought, for the action to be brought at all, as he (Mr. Lindley) never uttered the words that were complained of, and he was only inquiring at the time as to the nationality of the plaintiff firm and their goods. If, however, by a certain construction the words that he uttered could be regarded as damaging to the plaintiffs, he was willing to say that he was sorry. He was ready to say that he was satisfied with the explanation given by the plaintiffs as to their nationality, and he did not suggest that they were anything other than a reputable English firm.

MR. JUSTICE ATKIN said the settlement was satisfactory. It seemed to him that observations by Mr. Lindley in regard to the plaintiff company might have been misunderstood.

The record in the case was accordingly withdrawn.

MUNITIONS COURT CASES.

At a sitting of the Munitions Tribunal at Dundee on Friday, Frank Atkinson, electrician, asked a clearance certificate to enable him to leave an Arbroath controlled firm and accept service on urgent Government work. He stated that his work could be done by an older man, and he complained that his wages, £2 15s., were not sufficient in view of the amount of overtime he worked. In the event of breakdowns he was expected to work to any hour. He further stated that as the works were electrically driven they required great attention and he could not get time to make repairs. The Chairman said the certificate would be refused, and if Atkinson

thought his wages were inadequate he could appeal to the Board of Trade.

At the Blackburn Munitions Tribunal on January 26th a Corporation employé—a cable joiner—asked for release from his work in order that he might join the Forces. He said he either wanted to enlist or to be given more work to do on munitions. A Corporation official said they would do their best to meet the applicant in this, and the man thereupon said he was satisfied.

At Oldham last week an electrical instrument maker employed at Hollinwood, complained that his release certificate had been unreasonably withheld by his employers. His case was that he was employed on the erection of house service meters, and not being on Government work, not having an official badge, and not being, as he alleged, in receipt of trade union rate of wages, he had applied for work which would place him directly on Government business, and would bring him in the trade union rate of pay. His earnings with the firm were 33s. per week and 3s. war bonus, and at his new place he was to get 39s. and 4s. war bonus. A representative of the firm said it was difficult to say exactly whether the man was on war work or not. Before a badge could be given to a man he must be substantially employed on war work, and, in his opinion, the applicant had been on war work during the past six weeks. He had been engaged on meters for munition works, power stations, or on meters for submarines. Mr. W. Sellars (chairman) said that whilst meters for submarines undoubtedly were war work, he was not satisfied that the making of meters for ordinary works and power stations could be considered war work. The firm's representative said the firm had undertaken to let any man not engaged on war work go into the Army. There was a suspicion that there was more behind the application than had come out. The applicant had a friend who had worked for the Hollinwood firm, and as he had not had good health, the firm offered to release him so that he could recuperate. He had since got a job in the south, and the firm there had written to the applicant and other workers at Hollinwood offering them jobs. The speaker added that there was an increase of 2s. due to the applicant, but he said he would rather go to the place where his friend was, as his health was not so good. The Chairman said that was an after consideration entirely. The application was refused.

SOUTHAMPTON CORPORATION v. DUGGID.

At the Southampton County Court, the plaintiffs sued defendant for the cost, under a hire-purchase agreement, of electric fittings (£7 14s.) in the house occupied by him. From the evidence, it appeared that the house was previously occupied by a town councillor, and defendant agreed to take over the installation, it being promised that supply should be immediately connected if defendant paid £1 2s. 1d. then due. The next quarterly account for the installation was received, and he then said that he had only agreed to pay one sum of £1 2s. 1d. Defendant said he did not know when signing the agreement that he was making himself responsible for more than one single payment of £1 2s. 1d., and he paid that because he wanted to get into the house. He did not read the agreement, and there was no writing in the body of the agreement at the time. Later he heard from a Corporation canvasser that the amount of the alleged debt had been written off. The Judge, according to the *Hampshire Independent*, held that there was no agreement on the part of the defendant to pay the money.

AN IRISH ARBITRATION.

In this arbitration, to which we referred in our last issue, Mr. A. E. Porte has now given his award. According to *Freeman's Journal*, Mr. Brunker's claim was for £373, the balance of the contract and for extra work done.

The Marquess of Sligo made three counter-claims. He claimed a sum of £109 for alterations as to prices and deductions made by Mr. R. E. Mellon, the architect, from the contractor's accounts. A sum of £36 was allowed for this by the arbitrator. He claimed a further sum of £157 paid to Messrs. Edmundson's, Ltd., for completing work alleged to have been left undone by Mr. Brunker. The arbitrator allowed £62 5s. 3d. for this claim. The claim of the Marquess of Sligo for a penalty of £10 per week for delay was wholly disallowed. The Marquess of Sligo is to pay his own costs and the arbitrator's fees and expenses, and to pay five-ninths of Mr. Brunker's costs.

A 1,000-KW., 1,000,000-Volt Transformer.—According to the *Electrical World*, C. H. Thordarson, of Chicago, erected in the Exposition Grounds, San Francisco, a 1,000-kw., 1,000,000-volt transformer for 60-cycle operation. The windings were submerged in a 225-barrel concrete tank of oil, and the transformer complete weighed 30,000 lb. The low-tension 2,200-volt coils, of which there were 122, were connected in pairs across the 2,200-volt supply mains, with their midpoints grounded to the transformer frame. The 1,000,000-volt winding consisted of 190 coils wound with flat aluminium conductors insulated with paper. Some 90 miles of aluminium conductor and 270 miles of paper ribbon were used in the construction of the high-tension winding. Mr. Thordarson estimated the cost of the transformer at \$30,000, including special winding machinery.

WAR ITEMS.

The Question of Electrical Concessions in Russia.

According to a report published in the principal German commercial newspaper, no companies in Russia at present are in a more difficult situation than those which are engaged in the supply of energy for lighting and power purposes, including tramways. The annually increasing profits of these companies, which are mostly equipped with foreign capital, are said to have aroused, in the case of the State and the municipal councils, the desire to take advantage of the existing conjuncture of war by expropriating these profitable undertakings at as little cost as possible. We can understand an object of this kind when aimed at ventures in which German interests are chiefly concerned, but as a large amount of Belgian and French capital is also invested in these classes of undertakings in Russia, we assume that the Teutonic statement of the case, although it does not specifically mention any nations other than Russia and Switzerland, applies solely to companies in which German capital has exercised control in the past. At any rate, a dispute is reported to have arisen between the Government and the local authorities as to the future ownership of the supply works and tramways. At present two official projects are in opposition to each other. The first has been prepared by the Minister for Home Affairs, who proposes the compulsory transfer to the cities and towns of electrical undertakings which are of public interest. On the other hand, the Minister of Commerce is credited with a scheme for conferring upon the State a monopoly for granting concessions for these undertakings, and stipulating also that the owners of existing concessions must apply to the State for a concession to continue their business. The latter project is declared to have evoked great opposition in technical circles, and the Society of Engineers and Electro-technics, of Petrograd, has raised a protest against it. The scheme, which would deprive certain towns of large receipts, also contemplates the imposition of conditions which are much more unfavourable than those hitherto fixed in the case of concessions, and which would tend to check applications for such privileges. On one point only are the State and the local authorities said to be in agreement, namely, that the compensation to be paid to present holders of concessions shall be as little as possible; and both schemes proceed from the idea that a kind of expropriation has become necessary in the public interests. It is contended that the working of concessions is only right according to form, but that in fact it is the usurpation of a right devolving upon the general community, and the immediate and forcible rupture of the concessions would only represent the establishment of normal legal conditions. On this basis the companies would only be compensated for the fixed and movable assets in the shape of stations, cables, etc., but would receive nothing for the loss due to the stoppage of the concessions. It is stated that this principle has already found expression in practice in the case of the Kieff Tramway Co., whose works and rolling stock have been municipalised against the company's wish; and whilst the company claimed £2,100,000 by way of compensation, the City Council, excluding any indemnity for the concession, is only willing to pay £750,000. The report also refers to the well-known case of the Moscow Supply Co.—the branch of the Petrograd Electric Lighting Co. of 1886—although in this instance the Moscow City Council some time ago offered to pay a moderate compensation, for the unexpired term of the concession. More recently, however, the Town Council has sought to secure a reduction in the charges for supply from the State sequesterator, and the German suggestion from this fact is that the nearer the business of a supply undertaking is brought to the state of ruin the better will be the prospects of the Russians acquiring it at a "slaughter price."

Trade After the War.—Opinion is becoming more divided as to whether, at the conclusion of the war, Germany will be ready immediately to enter upon a trade war. Mr. T. Russell, speaking at the Rotary Club, Edinburgh, on the probable condition of trade after the war, said (according to the "Financial Times")—"At the close of the war, Germany would not be ready to compete. Germany was short of materials. Before she could dump goods she must obtain the material to make them with and means to pay for them. Many of her factories were closed already. Competition after the war would come from America long before it came from Germany."

Enemy Shareholdings in Australia.—Reuter's representative at Melbourne reports that the Federal Executive has approved regulations for the wiping out of enemy and naturalised shareholders in public companies and making the transfer of their shares to the Public Trustee until a year after the war is obligatory. Before April 15th enemy shareholders may apply to the Attorney-General, after transfer, to have their shares sold, and they will receive the proceeds. The regulations provide for the payment of dividends on enemy shares to the Public Trustee, after allowing reasonable living expenses.

Swedish Export Prohibitions.—An order has just been issued by the Swedish Government prohibiting the exportation from the country of insulating composition containing asbestos and manufactures of such composition.

Enemy Firms in India.—In the House of Lords last week, according to the "Daily Telegraph," Lord Svalenham asked the Under-Secretary of State for India whether effective steps had been taken to put a stop to enemy trading in India, and gave an instance of such alleged trading at Bombay. Lord Svalenham, in reply, said the orders dealing with this matter laid down broadly that all hostile firms in India should cease to trade except under licence by the Government of India. The House might rest assured that the Government of India would actively co-operate with the Home Government in carrying out the intention of preventing these enemy firms from remaining permanently amongst us.

Prohibited Exports.—The exportation of pocket-lamp cases and cases fitted with bulbs, but not containing batteries, to all foreign countries in Europe, and on the Mediterranean and Black Seas, other than France, Russia (except through Baltic ports), Italy, Spain, and Portugal, is prohibited.

BUSINESS NOTES.

Book Notices.—*Acoplanes and Airships.*—By W. E. Dammatt. London: Whittaker & Co. Price 1s. net.—Like the book on "Submarine Vessels" by the same author, this is a popular and elementary book for the edification of the general reader, but being the work of an author who knows his subject, is not so "popular" as to be without interest to an engineer. It deals with the principal features of aircraft of all kinds in an entertaining and instructive manner, and is quite suitable for those who, not having time to study the subject fully, yet desire to have sound general ideas upon it, and to be in a position to understand the nature and bearing of new developments. The only feature of the work to which we take serious exception is the author's literary style, which in many places is really shocking. What, for instance, is an "increasing filament," and how is it "practised"? We learn that "smokeless powder is used which makes it very difficult for the location of an artillery battery," and the aerial bombardment of German submarines in Ghent Harbour is mentioned as an operation frequently performed. There is a canal there, but does the author really mean Ghent? If the author would have his proofs read by a competent friend, the pleasure of reading his book would be very greatly enhanced.

Excess Profits Duty and Excess Mineral Rights Duty. By R. M. Montgomery and W. Allen. London: Butterworth & Co. Price 7s. 6d. net.—In this book the authors give an explanation of the Finance (No. 2) Act, 1915, which imposed the new War Tax known as the "Excess Profits Duty." The chief provisions of the Act are explained in due order, and instructions are given as to finding whether the profits of any business are liable to the duty, and the amount of the latter. The Act is also analysed and discussed in detail, and, finally, the complete Act is printed without notes, for convenience of reference. The book should be found very useful by those in charge of the accounts of firms which come within its scope.

Proceedings of the American Institute of Electrical Engineers. Vol. XXXV, No. 1, January, 1916. New York: The Institute. Price 1s.

"Technical Paper of the Bureau of Mines." No. 123, "Notes on the Use of Low-Grade Fuel in Europe." Washington: Government Printing Office.

"A Meteorological Treatise on Circulation and Radiation in the Atmospheres of the Earth and the Sun." By F. A. Bigelow. London: Chapman & Hall. Price 21s. net.

Journal of the Institution of Electrical Engineers. Vol. LIV, No. 255, February 1st, 1916. London: E. & F. N. Spon, Ltd. Price 3s. 6d.—This issue contains the following papers:—"Predetermination of the Performance of Dynamo-Electric Machinery," by Prof. Miles Walker. "Proposed Standard Numerals for the Scales of Measuring Instruments," by Mr. A. P. Trotter. "Hydro-electric Power in New Zealand," by W. Wilson.

"Experimental Wireless Stations." By P. E. Edelman. Minneapolis, Minn., U.S.A.: P. E. Edelman. Price \$1.50.

The Import Trade of India.—The Board of Trade Journal publishes the following figures taken from a report of the Director of Statistics to the Indian Government:

	1913.	1914.	1915.
	Rupees.	Rupees.	Rupees.
Railway plant and rolling stock	76,214,500	112,766,200	76,445,400
Metals—Iron and steel, and manufactures thereof	138,263,000	156,234,500	77,992,900
Machinery of all kinds, including belting for machinery	69,810,000	2,839,200	51,833,200
Cutlery, hardware, implements (except machine tools), and instruments	59,594,700	62,957,500	35,054,500
Metals, other than iron and steel, and manufactures thereof	45,627,000	65,181,500	25,630,500
	Rupee at par = 1s. 4d.		

Catalogues and Lists.—GENERAL ELECTRIC CO., LTD., 67, Queen Victoria Street, London, E.C.—Leaflet announcing altered prices of ignition dry batteries (Hellelsen) consequent upon the new import duty on "motor accessories," and the decision of the Customs authorities that these batteries come under that heading. New pamphlet (R.1,951) of eight pages, giving illustrations and prices of Robertson carbon-filament lamps for various classes of illumination, flame or candle lamps, tubular lamps, heating lamps and battery lamps. A number of views are given of the Osram-Robertson lamp works and the glass works at Lemington-on-Tyne.

MESSEES, SIMPLEX CONDUITS, LTD., Garrison Lane, Birmingham.—Illustrated circular (No. 416) giving particulars and prices of Anti-Zeppelin reflectors for half-watt and metal-filament lamps, also Simplex lanterns for half-watt lighting in shops, factories, &c.

MESSEES, MIRRELES, BICKERTON & DAY, LTD., Hazel Grove, near Stockport.—12-page pamphlet containing a full and illustrated description of Mirreles-Diesel engines of their new "Crosshead" type. Also a list describing their electrically-operated air regulating device for Diesel engine compressors.

BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—12-page illustrated price list (No. 5,100 A) describing their starting resistances for C.C. motors.

MESSEES, A. D. RILEY & CO., LTD., of Wellington, N.Z., have sent us a pamphlet containing a reprint of a description of the municipal sewerage system of Petone, N.Z., for which they were the contractors, with Mr. Wilson Ormrod, A.M.I.E.E., as their engineer.

THE EDISON & SWAN UNITED ELECTRIC LIGHT CO., LTD., of Ponder's End, have prepared for advertising purposes what they term "Current Economy Correspondence Cards." The firm's trade customers will be able to obtain quantities printed with their own name and address so that the reply half with the order reaches them.

The Growth of Mazda.—Production has been so greatly increased in the lamp works at Rugby that new plant has trespassed on the normal storage space, leaving insufficient room to accommodate the stock. The B.T.H. Co. has, therefore, taken over the Rugby skating rink to provide more storage capacity. The annexe itself is already crowded, and a second floor has to be built immediately to facilitate working in the building and add to its capacity. At the same time the existing medley of lighting devices will be replaced by high-efficiency units on the well-known B.T.H. principle. The Mazda lamps are taken by an electric automobile to the new store, which is situated very near the railway station, thus ensuring rapid dispatch.

Board of Trade Exhibition.—The Board of Trade Exhibition in London opens on February 21st, and will continue until March 3rd. At Stand No. A.16, MESSEES, WARD & GOLDSTONE, notwithstanding that they are full up with work and are under Government control, will be, by special permission, exhibiting a large variety of their manufactures, principally of goods which, previous to the war, were made almost entirely in Germany. The exhibit will include a large range of electric pocket lamps, torches, refiles for same, hand lamps, electro-medical apparatus, &c., also electric appliances for the car and garage.

Liquidations.—**AUTOMATIC ELECTRIC BLOCK SIGNALING CO., LTD.**—A meeting of creditors is called for February 9th, at 10, Victoria Street, S.W., to hear an account of the winding up from the liquidator, Mr. A. Colle.

SHEFFIELD ELECTRICAL ENGINEERING CO., LTD.—A meeting is called for February 29th, at Ashton-under-Lyne, to hear an account of the winding up from the liquidator, Mr. H. Cawood.

Trade Announcements.—The business of **VENNERS SIGNS, LTD.**, is being continued at 6, Old Queen Street, Westminster, S.W., under Mr. Batten.

THE EBURY ELECTRICAL ENGINEERING CO., of 80, Ebury Mews, Victoria, London, S.W., have been appointed British agents for the Dyneto electric lighting and engine starting sets for motor cars.

MR. E. J. JARVIS, electrician, of 48, Nutley Place, Plymouth, announces that he is retiring from business.

THE PALMER ELECTRICAL CO., who represent the Nya Förenade Elektriska, of Sweden, state that they hold a stock of electrical supplies, motors, &c., at their new address at 52, High Street, London, W.C.

Prices Advance.—**THE JACKSON ELECTRIC STOVE CO., LTD.**, announce a further increase of 10 per cent. in all their prices consequent upon the continued increase in prices of raw material and labour.

Bankruptcy Proceedings.—**G. E. BONNER**, electrical engineer, Palmer's Green, Middlesex.—First meeting, February 11th, at 14, Bedford Row, W.C.; public examination, February 21st, at the Court House, Edmonton.

For Sale.—The Corporation of Nuneaton has for disposal one 170-kw. Willans-Siemens direct-coupled D.C. generator, 350 amperes, 460 to 500 volts. The Tramways and Electric Lighting Committee of Swansea has for disposal the following electrical plant:—One 100-h.p. Willans & Robinson engine direct coupled to a 75-kw. Siemens-Schuckert 440/460-volt shunt-wound D.C. generator, and one 300-h.p. McLaren marine type engine, direct coupled to a 235-kw. Siemens-Schuckert 440/560-volt D.C. compound-wound generator, complete with a Yates & Thoms jet condensing plant. See our advertisement pages to-day.

An Inquiry from Canada.—H.M. Trade Commissioner in Canada reports that a manufacturers' agent in Montreal wishes to get into touch with United Kingdom manufacturers of electrical goods, and he desires to receive catalogues, price lists, &c. (Reference No. 16.) Apply to the Board of Trade Commercial Intelligence Branch, London.

LIGHTING AND POWER NOTES.

Accrington.—**PROPOSED EXTENSIONS.**—It is anticipated that owing to the rapidly increasing demand, extensions to the electricity works, involving an outlay of £25,000, will need to be undertaken by the Electricity Committee in the near future. A special meeting of the Committee is being called to consider the matter.

Australia.—**MELBOURNE WIRING SCHEMES.**—Although the City Council rejected the proposal to install electricity in city buildings under which the Council would be reimbursed in 30 monthly payments by the owners, the Electricity Committee has had under consideration and has recommended another scheme based on the hire-purchase system. The Committee is of opinion that unless some scheme is devised for assisting owners to wire the comparatively old premises in the city, the supply of current to these will always be very limited notwithstanding the low rates of charge for electricity for lighting, which are the lowest in Australia. After investigation and examination of similar schemes in other parts of the world, the Committee considers that it is desirable for the Council to introduce a hire-purchase scheme for the wiring of houses in the city, viz., at the signing of the agreement 10 per cent. of the estimated or ascertained cost of the installation to be paid, and the balance of cost in equal quarterly instalments plus interest at the rate of 6 per cent. on the amount outstanding. On the assumption that each year 500 installations of the average size are wired, the annual outlay on the part of the Council would be about £3,500. The Committee also considered a scheme providing for the hiring out of electric motors, electric irons, heating, cooking, and other electricity consuming devices. The Sydney City Council electric supply department have to-day on hire to consumers 2,546 electric motors, aggregating 12,160 h.p., at a capital cost of £60,000; the Committee considers that increased revenue from the sale of current in this direction, under Melbourne conditions, would produce about £50,000 per annum. So far as electric cooking is concerned, the Committee is disposed to wait until a supply of reliable and reasonably priced cooking apparatus is available on the market before extending the scheme in this direction, realising that in order to foster a demand for electricity for cooking, it would be necessary to arrange for the hiring out of cookers to the consumers. As the Council's statutory powers are restricted to the supply of electricity, it will be necessary to apply to Parliament for additional powers to cover the propositions recommended in the report.—*Australian Mining Standard.*

In connection with the West Australian power plant now being erected at Perth, the Federal Council of the Electrical Association of Australia has made representations to the Premier of West Australia on the desirability of maintaining a 50-cycle frequency throughout Australia, but it is said that the 40-cycle scheme is too far advanced to revert to the generally accepted Australian standard.—*Commonwealth Engineer.*

The Long Reach Electric Lighting Co. (Queensland) has been formed to utilise the pressure from the local artesian bore to generate electricity for lighting the town, and has applied to the Council for its consent to an Order in Council being granted for this purpose.

The Hamilton (Queensland) Council has decided to instruct an electrical engineer to prepare plans for lighting the town with electricity.

The Kilsroy Shire Council (Queensland) is also applying to the Government for a loan for the purpose of an electric light installation.—*Tenders.*

Birkenhead.—**REVISED PRICES.**—The T.C. has revised charged for current as under:—In the borough, ordinary lighting, 4d. per unit, plus 10 per cent.; ordinary power and heating, first 1,500 units per quarter, 14d. per unit, plus 10 per cent.; beyond, 1d., plus 10 per cent. Prepayment meters, increase from 44d. to 5d. Outside the borough, ordinary lighting, 5d., plus 10 per cent.; ordinary power and heating, 2d., plus 10 per cent.; prepayment meters, increase from 54d. to 6d.

Bolton.—The L. & Y. Railway has agreed to bear the cost of new mains in Rake Lane to serve the company's new electric power station at Clifton Junction.

Chelmsford.—**PUBLIC LIGHTING.**—The T.C. has so far failed to come to a definite arrangement with the Electric Supply Corporation, Ltd., as to payments for public lighting on account of the restricted use of lamps. The company offered a rebate of £700 per annum, but the Council wishes to pay only £330 per annum, or a *pro rata* amount for any shorter term whilst the lamps remain extinguished. The company declined to agree to this proposal, but intimated that if an arrangement was made as to a new contract when the present one expires next March, it would probably be prepared to agree to the Council's proposals regarding payment under the existing contract. The question has been referred to a Sub-Committee, which is to confer with the company regarding the suggested new contract.

Canada.—The electors of the city of Edmonton have approved the agreement between the city and the Edmonton Power Co. for a supply of electricity to the city for a period of 30 years on a kw.-hour basis, the price varying from 1.3 cents down to .85 cent per kw.-hour, depending on the quantity taken.

The Edmonton Power Co. controls the water rights of the Saskatchewan River at Rocky Rapids, but on account of bad regulation in this district, dams will have to be built further up the river, and one of these will be placed some 10 miles back from the power house. The scheme of development at this point, including adequate water storage, has been under consideration for about three years, and some 60 square miles of land have been surveyed, and will be cleared and prepared for an artificial lake to impound the necessary water. The scheme is estimated to cost \$6,000,000, this including an electric railway from Edmonton to the power site; the work will take probably four or five years, but the company has offered to at once take over and operate the present steam plant and sell electricity at 1.3 cents per kw.-hour to the city, which is to be responsible for the capital charges. It is estimated that the present generating cost of power in Edmonton is approximately 2.75 cents per kw.-hour, exclusive of distribution charges.—*Canadian Electrical News.*

China.—A SHANGHAI REPORT.—Mr. A. H. Preece, of Messrs. Preece, Cardew, Snell & Rider, consulting engineers, has recently reported to the Shanghai Municipal Council on the progress of the electrical undertaking and future plant extensions required to keep pace with it. So rapid has been the increase in output, that Mr. Preece forecasts annual additions of 10 or 20 million units, the annual demands increasing every year by 4,000 or 5,000 kw. As regards lighting units only, Shanghai increased from 5.4 millions in 1912 to 14.7 in 1915; that is, it is well ahead of Birmingham, and equal to Manchester in 1911.

In the matter of power units, over 30 millions have been added in three years. The expansion of the undertaking is regarded as inevitable, and it is only necessary to decide on the most suitable plant. New power consumers will reach 4,850 kw. in 1916, and there is evidence that in 1917 a further 3,000 or 4,000 kw. will be required, this being distinct from domestic lighting, heating and power, which has averaged an addition of 2,000 kw. for five years. Summarising the position, future maximum loads are anticipated of 19,000 kw. in 1916, 23,000 kw. in 1917, 26,500 kw. in 1918, 30,000 kw. in 1919, and 33,000 kw. in 1920.

The present capacity of the Riverside and Fearon Road stations is 18,400 kw., which, allowing one 5,000-kw. set as spare, leaves the maximum safe output at 13,400 kw. Mr. Preece concludes from the conditions that the maximum load must be supplied from the Riverside station in future, and that this justifies the provision of at least 20,000 kw. of new plant there, making a total capacity of 34,000 kw. of plant installed; to obtain the 20,000 kw. of new plant he advises the immediate installation of a 5,000-kw. turbine set, also that orders be placed for (a) one 10,000-kw. and one 5,000-kw. sets, or (b) two 10,000-kw. sets, or (c) one 10,000-kw. and one 7,500-kw. sets; a 10,000-kw. set is regarded as essential, and should be ordered at once.

Mr. Aldridge's estimate of March, 1915, for extensions amounted to £1,276,772, but including the cost of the 5,000-kw. set, the total will amount to £1,265,000, which will be spread over 1916, 1917 and 1918. By the latter year there will be some £10,000,000 invested in the undertaking, and Mr. Preece considers that there is little doubt that by then the output sold will have reached 100,000,000 units. He further estimates that as the average selling price will be about c.27, and the present price is c.328, there is every prospect of reduced prices to lighting consumers.

The report as reproduced in *Eastern Engineering*, concludes with a suggestion as to distributing a portion of the profits of the undertaking for the general benefit of all ratepayers. Owing to the community controlling the undertaking, fresh capital can be raised at 5½ per cent. or so, as against say 7½ per cent. if the undertaking were a private concern; in consequence, it is suggested that the community is entitled to charge interest at say 1 per cent. on the money found by it. The effect of this would have been to raise the interest charge in 1914 to £13,34,190 instead of a dole of £13,30,265, and in 1915 a similar amount instead of about £13,35,000, and he recommends its adoption.

It is reported that a British firm has arranged to install an electrical plant at Handaohezu, on the Chinese Eastern Railway, 170 miles east of Harbin. The plant will provide for several thousand consumers and street lighting.

Continental.—ITALY.—Cabanaro, with a good part of the province of Calabria II., are about to be supplied with electricity from a large hydroelectric plant, the plans of which have just been completed. The scheme contemplates the enlarging of the small existing plant at Mongiana and Sera S. Bruno to supply the whole of the province, the use of the waters of the Rivers Allaro and Vezzallaro, and the erection of four high-pressure lines. Signor Gino Canzio is responsible for the scheme.

The projected amalgamation of the Società Anonima Elettrica Veronese and the Società Canale Milani has been postponed owing to the opposition of the minority of the shareholders. The scheme is to be submitted to a competent court.

Dover.—NEW LOANS, &c.—The T.C. has decided to apply for a loan of £4,000 for cables necessary to carry out a special contract, for the same purpose the loaning authority has agreed to renew a loan of £157,519 for five or seven years, with option to repay at the end of five years at six months' notice. The Council has accepted tenders for large and small cable.

Exeter.—WORKHOUSE LIGHTING.—The B. of G. has adopted a report of the surveyor for dealing with the electric lighting of the workhouse, and has decided to advertise for tenders for Block 3 in the scheme.

Haslingden.—BULK SUPPLY.—Provisional arrangements have been made, with the consent of the Accrington Corporation, for obtaining an additional supply of electricity from Rawtenstall, to supplement that obtained from Accrington. Haslingden is under an agreement to take all the current it requires from Accrington, but as the latter is unable to give a regular supply at present, the two towns have mutually agreed on this course.

Herne Bay.—E.L. SCHEME.—The Gas and Electricity Co. has asked the U.D.C. to consent to a further extension of time for carrying out the E.L. scheme for the town, and the clerk to the Council has been deputed to discuss the matter with the directors, and report.

Hornsey.—PRICE INCREASE.—The B.C. has increased the price of electricity, from March 31st, by 10 per cent.

India.—The Council of Regency, Bahawalpur State, has decided to give the City of Bahawalpur a public supply of electricity for street lighting and private use. Acting on the advice of the electrical engineer to the Panjab Government, the contract for the generating plant has been placed with Messrs. Balmer, Lawrie & Co., of Calcutta.

Kingsbury.—At last week's meeting of the U.D.C., the Clerk said the North Metropolitan Electric Power Supply Co. had made the Council a small allowance in respect of unlighted lamps, but this had been considered insufficient. A similar point had also been raised by another municipal body, its contention being that it ought not to pay for what it had not received. The case was taken to the High Courts, but judgment had been reserved. Having regard to the fact that the decision would no doubt have a considerable bearing on the position of affairs at Kingsbury, the Clerk thought it would be far better to allow any further report upon the question to be held over. The Council agreed to this course.

Liverpool.—YEAR'S WORKING.—The total income of the City Council's electricity undertaking for the year ended December 31st last, amounted to £546,808, of which £216,733 was in respect of the sale of energy for lighting and power, £118,824 for tramway supply, and £1,592 for public street lighting. Meter rentals brought in another £4,622, while £2,169 is credited in respect of sales and repairs in connection with installations. Expenditure during the 12 months totalled £136,249. Of this sum £60,868 is entered as generation expenses; £10,625 for distribution; £38,139 for rents, rates and taxes, and £16,497 for management expenses. The balance (£209,558) has been carried to net revenue account, where £50 is added as interest. Against the total is debited £65,749 in respect of interest; £57,635 transferred to sinking fund; and £36,223 transferred to renewal fund leaving £50,000 to be given in aid of the general rate.

The electric supply estimates for the present year provide for an expenditure of £57,191 on the reserve and renewal account, as compared with an actual expenditure of £34,133 in 1915, and £81,516 in 1914. On revenue account an expenditure of £214,837 is provided for, against £171,165 and £145,648 in 1915 and 1914 respectively. It is estimated that expenditure on capital account will amount to £17,167, but in regard to £15,000 of this money the sanction of the Treasury has to be obtained. Last year the expenditure was £2,344, and in 1914, £26,974.

London.—SOUTHWARK.—The Electric Light Committee reports that it has found it necessary to again revise the scale of charges for lighting and power. It is anticipated that the alteration in the scale, together with the various revisions, will show an increased income of £5,796.

Manchester.—PLANT EXTENSIONS.—The L.G.B. has sanctioned the proposal to divert £83,000 of the sum authorised in respect of the Barton scheme for the purchase of machinery to be installed temporarily at the Stuart Street station, in order to relieve the congestion and heavy loads. When the Barton scheme is completed it is probable that this plant will be transferred to the new station.

The coal question is no longer a source of anxiety to the electricity department. Coal is being obtained from Northumberland, the extra price paid being balanced by the higher electricity rates and the augmented consumption of energy.

During December last there was an increase in consumption of nearly five million units of electricity as compared with December, 1914; the increase of the power load was 24 per cent.

New Zealand.—The Ohakune B.C. is considering the installation of an auxiliary generating set as a stand-by to its hydro-electric plant, which was described in our pages of December 17th, 1915.—*Tenders.*

The Riccarton B.C. has decided to borrow £3,300 for electrical reticulation and £200 for wiring private installations.

New Zealand.—BRITISH 2^d. AMERICAN TENDERS.—Tenders for the supply of transformers for the electricity department of the Auckland City Council were recently received by the Public Services Committee, and passed on to the electrical engineer, who was informed that the Committee was prepared to consider only British-made goods. The engineer favoured an American tender as it was strictly in accordance with the specification, was complete, and offered material of a high class and a reasonable time of delivery. He said he could only recommend acceptance of English goods if the firms gave a satisfactory promise of delivery at their own works in 12 weeks. If this were done he was prepared to recommend the acceptance of tenders from English firms.

The Committee left the matter in the hands of the Mayor to act after communication by cable with the English firms mentioned.

Ripponden.—The Ripponden Commercial Co., Ltd., is on the point of installing electrical driving, by which it is hoped to save the cost of from 50 to 60 tons coal weekly. One room is to be taken at a time, and each room will have its own motor.

Salford.—PROPOSED LOAN.—The Electricity Committee has recommended that application be made to the L.G.B. for sanction to borrow £13,660 for extensions of plant at Frederick Road station.

The Committee has entered into a new agreement with the Lancashire Electric Power Co., for the supply of electricity in bulk for a period of two years.

The proposed increase of the charges for electricity is to be considered by the Council at its next meeting.

Shipley.—PRICE INCREASE, &c.—The U.D.C. has increased the charges for electricity for power purposes by 10 per cent. from April 1st. This does not apply to cases covered by special agreement.

The Electricity Committee has deferred consideration of an inquiry from Messrs. C. F. Taylor & Co. as to a supply of electricity to Lower Holme Mills, Baildon, until it has been ascertained whether the Baildon U.D.C. would consent to the Council supplying electricity in the Baildon area.

PLANT INAUGURATION.—On Wednesday last a new three-phase turbine set, together with switchgear, boiler plant, &c., at the Council's generating station, was to be officially started up, the proceedings being followed by a dinner at the Institute, Salthouse.

Stoke-on-Trent.—NEW PLANT.—The T.C. has decided to install transforming equipment for a sub-station at the California Works of Messrs. Kerr, Stuart & Co., Ltd., and sanction to the borrowing of £1,200 has been applied for for that purpose, and has been provisionally approved.

Sunderland.—E. L. ESTIMATES.—The estimates of the Corporation electricity department show that the income for the year ending March 31st next, is estimated at £72,102, compared with last year's estimate of £72,361, and £73,517 the sum actually received. The sale of electricity is expected to realise £67,048, compared with last year's actual income of £65,526. A decrease is allowed for in private heating and lighting, the estimate being £16,092, while last year's actual figure was £17,764. Power is expected to give an increased receipt, the figure being £36,858, against £33,640 last year. The total working expenses are expected to be £37,818, against £34,271 estimated for last year, and £34,352 actually spent. There is a considerable increase allowed for in the cost of coal, owing to the war, the estimate being £16,148, compared with £12,479, the actual cost last year. The total expenses are put at £41,306, against £40,090 the actual expenditure last year. There will, it is expected, be carried to net revenue and appropriation account £30,796, against £33,426, the actual amount realised last year. This balance will be apportioned as follows:—Repayment of loans, £17,612; interest on loans, £10,099; interest on lands and redemption, £157; contributions to capital, £963; income-tax on profits, £968; leaving for the renewals fund £995, as compared with £4,653, the amount placed to the renewals fund 12 months ago.

Whitby.—The U.D.C. has concluded arrangements for extending the electricity mains in High Stakesby, contracts for current for a period of years having been entered into with the proprietors of St. Hilda's School, the Manor House and Sneaton Castle.

Wigan.—PROPOSED EXTENSIONS.—The General Purposes Committee has adopted a resolution recommending the T.C. to engage the services of an expert electrical engineer to report upon the Corporation electricity works and upon a proposed scheme involving an expenditure of about £30,000 on new plant. This scheme, which has been under the consideration of the E.L. Committee for several weeks past, is for the provision of an additional 3,000-kw. turbo-alternator, a surface condenser, two rotary converters, one additional water-tube boiler and certain accessories, and the estimated total cost is £30,400.

Whitstable.—The U.D.C., which has undertaken the generation of electricity for public use for the Electricity Co. at the sewage pumping station, has informed the debenture-holders that the work will be discontinued unless certain payments due are paid by a certain date. Regarding the public lighting contract with the company, the latter has offered to accept 35s. per lamp for the period of the war, and counsel, whose opinion on the contract has already been sought, is to be consulted as to the offer.

TRAMWAY and RAILWAY NOTES.

Continental.—ITALY.—The Società Tranvie e Imprese Elettriche is seeking a concession from the Provincial Deputation and the Ministry of Public Works for two lines of electric tramways running respectively from Castellanza, through Olgiate and Cassano to Gallarate and from Gallarate through Lenate and Pozzolo to Oleggio. The necessary surveys for these lines have already been made.

The Central Umbrian Railway, now being provisionally worked with steam traction, will be equipped with electric driving power next year. The current will be supplied to Papigno by the Società del Carburio di Calci. From Papigno three-phase current will be supplied to Marsciano transforming station for conversion to single-phase current. The electric traction will be effected by locomotives, driven by four single-phase motors geared to the axles, each motor of 90 H.P.

The new goods locomotives of the Società Elettrica Bresciana have been built in the works of Messrs. Carminati e Toselli, of Milan, and equipped by the firm of Galileo Ferraris. They are equipped with four coupled motors of 80 H.P. each.

An influential meeting of syndics and other representatives of cities and towns around the Lake of Garda met recently to consider a scheme of extension of the Mantua-Peschiera electric railway. After a long discussion, it was decided to memorialise the Government for the concessions for extensions from Verona and from Peschiera to Lazise and Riva, *via* Mori and Rovereto. The promoters of the scheme have in view the great concourse of tourists that will be attracted to the shores of this beautiful North Italian lake, where the success of Italian arms will have freed the remainder of the Trentino from Austrian overlordship, as well as the knitting of ties with the reconquered territory.

Dudley.—TRAMWAY ACCIDENT.—A second death has occurred as a result of the tramway accident on January 16th, and the inquest formally opened by the Wolverhampton coroner, has been adjourned until February 14th.

Fairsworth (Lanes.).—INQUEST.—On Tuesday an inquest was held on Martha Wilkinson, who received fatal injuries in the tramway smash at Radcliffe recently. Harry Pusey, driver of the runaway Bury car, said that when he got half way down the hill on Radcliffe New Road, the car was travelling at about 12 miles per hour, or two miles under the limit allowed; he tried to pull up at the stopping place, but the car commenced to skid, and he attributed the accident to the skidding of the wheels, and to the rails being in a treacherous condition. The car had been all right previously. A passenger thought that just before the collision with a van the car would be travelling at 30 miles per hour. A verdict of "Accidental death" was returned, and the driver was exonerated from blame.

Ilford.—YEAR'S WORKING.—The somewhat belated though instructive report of Mr. L. E. Harvey, the tramway manager, on the working of the Council's tramway undertaking for the year ended March 31st last, shows that there was a deficit of only £21, as compared with a loss of £3,567 on the previous year's operation. The total receipts, £31,981, were £6,188 more than in the previous year, due to the running on the lines leased from Barking and to a reduction in bus competition. The car mileage 877,813, shows an increase of 45,918, and the passengers carried numbered 9,203,077, as against 8,036,552 in 1914. We note that the Edison electric trolley wagon has been continuously in work, with the most satisfactory results; it has saved time in getting to breakdown and has been largely used for conveying stores, &c. Mr. Harvey adds his conviction that it would pay the department to invest a 2-ton electric wagon for permanent way use in place of hiring horses as at present for hauling and cartage work. It is believed that the present year will show a profit on the working of the undertaking, for the receipts are considerably in advance of the previous year's takings.

Lancashire.—A correspondent, writing on the shortage of tramway conductors in South Lancashire, says that this is due mostly to them obtaining far better-paid work in the local collieries, and not, as is usually supposed, to extensive enlistment in the Army.

Liverpool.—YEAR'S WORKING.—The accounts of the Tramway Department of the City Council for the 12 months ended December 31st last, provide for a contribution of £100,000 in aid of the rates. Income from all sources during the period under review totalled £707,097, traffic revenue contributing £696,893. Expenditure during the period amounted to £483,405, of which £192,353 was in respect of traffic expenses; £86,350 for general expenses, £30,594 for general repairs and maintenance, and £124,106 for power expenses. This leaves a balance of £223,692, carried to net revenue account, where it is increased to £242,673 by the addition of interest and a sum transferred from the suspense account. From this total has to be taken £50,084 in respect of interest, £4,368 for rent of leased lines, £64,526 for sinking fund charges, and £23,193 to be carried to the reserve, renewal and depreciation account, leaving £100,000 for rate aid.

London.—The Metropolitan Electric Tramways Co. is applying for powers to postpone, until three years after the termination of the war, the liability of the Middlesex C.C. to proceed with any tramway and street widenings authorised by Parliament in 1911; also to postpone until the same period the time granted in 1913 for erecting railless traction vehicle equipment in Woodford and Tottenham, from Green Lanes to Ferry Lane.

Manchester.—The trolley boys employed in the tramway department have been dissatisfied for some days past with their pay, and, following the short-lived strike reported in our last issue, brought about because they thought they were receiving less than the new trolley girls who have just been engaged, the boys have asked for an advance of wages of 2s. per week. The Tramways Committee has offered a war bonus of 1s. per week and overtime at the rate of time and a quarter, and at a meeting of the boys last week this offer was accepted. There was a fair minority against accepting the bonus, and these left the meeting and got some of the lads on the cars to cease work again. There was no interference with the car service, and the "strike" quickly fizzled out.

Plymouth.—**TRAMWAY PURCHASE.**—The arbitration with regard to the taking over by the T.C. of the undertaking of the Devonport and District Tramways Co. has resulted in the price being fixed at £103,970. The company claimed £257,000, and the Corporation's assessment of the value was £93,000. A loan of £5,000 for the purchase of six new cars has been sanctioned for 15 years.

Rochdale.—In consequence of a shortage of steam at the electricity works, there was a failure of the electricity supply on January 26th, and the cars on all sections were stopped for about 20 minutes.

Sunderland.—**REVENUE ESTIMATES.**—The estimates for the year ending March 31st next of the Corporation tramway department show that the estimated total income is £77,687, of which £77,300 is put down as traffic revenue, compared with last year's estimate of £74,882, and an actual income of £75,615. The working expenses are estimated at £43,467, as against an estimate for 1914-15 of £42,216, and an actual expenditure of £41,519. The traffic expenses are estimated at £20,860, an increase of over £1,000 on last year's figure, largely owing to increases in wages; whilst the general expenses are put at £6,127, compared with £5,608 last year. The sum of £34,223 will be carried to net revenue account, which is increased by bank interest to a total of £34,485, compared with last year's actual amount of £34,331. The sum of £5,000 will be appropriated from the balance for the relief of rates, whilst the reserve and renewals fund will receive £9,261. Loan repayments will amount to £10,767; interest on loans, £6,277; income-tax on profits, £2,438; Wheatsheaf offices part repayment £400, and car covers £400.

Trafford Park.—**LIGHT RAILWAY INQUIRY.**—On Thursday and Friday last week an inquiry, authorised by the Light Railway Commissioners, was held in Manchester, touching the application of Mr. Marshall Stevens and others—persons concerned with the ownership of land in Trafford Park—for sanction to construct three light railways in and adjoining the Park. The railways proposed were approximately 2 furlongs, 4 furlongs, and 7 furlongs in length, and, on behalf of the applicants, it was stated that they were necessary for the conveyance of the increasing number of workmen who were employed in the Park, and also for goods traffic. At various points tramway rails had been down for years, but no cars had run over them. The application was opposed by the whole of the railway companies, the Manchester Ship Canal, Lancs. County Council, the Stretford District Council, Manchester Corporation, and a number of other public bodies, who urged that the proposed railways were not in the public interest, and alleged that it was the intention of the promoters to give preference to commercial undertakings in Trafford Park over those outside. In the result the application was refused.

TELEGRAPH and TELEPHONE NOTES.

Australia.—Justifying the new telephone charges of 1d. per call for subscribers and 2d. per call on slot machines, the Postmaster-General recently stated that in other countries the rates were much higher, except in Sweden, Switzerland, and Denmark, where labour was cheap. In Australia the average wages paid to the telephone employees, including administration and supervision, were 13s. 6d. per hour, compared with 9.09d. in America and 6.25d. in England. The cost of the mechanical section in Australia was 21s. 19d., in England 10s. 7d., and in the United States 16s. 20d. per hour. Linemen in Australia received 17s. 34d., in England 10s. 7d., and in America 15d. to 17d. per hour.

The Postal Service showed a deficit for the year ended June 30th last of £629,722, compared with a deficit of £501,457 in the previous year; the telegraphs alone made a loss of £106,461 compared with £151,446, and the telephones a loss of £364,109 compared with £296,424.

As the result of a request made by the Professional Officers' Association in Sydney, that the Postmaster-General should give preference to Australians in cases where they were qualified for higher positions in the service, the Postmaster-General has directed that all applicants for an electrical engineership at Adelaide, now vacant, must undergo an examination. Similar examinations will

take place in future in the case of other senior positions as they become vacant. This, Mr. Webster thinks, will afford Australians the opportunity they have been contending for.—*The Age.*

Hull.—The accounts of the Corporation Telephone Committee for 1914-15 show income £138,675; working expenses, £95,102; works protection and war bonus, £226; marriage dowries and pensions, and one year's contribution to staff fund, £5,629, a total of £100,957, to which there was added for interest and sinking fund charges, &c., £32,328, a gross total of £133,285, leaving a net balance of £5,390. The loan repayment charges, amounting to £10,689, were for one year in the case of the original undertaking, and as regarded the ex-National undertaking, from the date of borrowing—May 6th, 1914—in compliance with the requirements of the Local Government Board. After paying the expenses caused by the removal of officers from Hull, consequent upon the transfer, and meeting the cost of replacement of switchboard cables, there remains a credit balance of £11,684 in the reserve fund. The capital account shows a net expenditure of £198,183, which included the purchase of the ex-National undertaking, and an amount of £3,654 capital expenditure since January 1st, 1912. The total capital outlay was £313,112.

In submitting a report on the undertaking the engineer (Mr. T. Holme) stated that the accounts in connection with the plant acquired from the Post Office covered a period of 34 years. The gross profit amounted to £37,717. He estimated £3,600 as the loss per annum on the Post Office system before the transfer. The main items which turned this loss into a profit on the amalgamation of the two systems were: Salaries of Post Office staff not replaced, £2,500 per annum; profit on Wincolmlee system, £2,500 per annum; loss on 25s. tariff, now abolished, £2,000 per annum. The effect of the war would be to keep the income down and increase the expenditure. But for the war, the increase of income on the amalgamated system would have exceeded £1,000 per annum. The total length of single wire on the system was 43,254 miles. The estimate for 1916-17 returned the profit at £1,030.

Mongolian Telegraphs.—A Russo-Chino-Mongolian telegraphic conference has decided that the telegraphic lines from Kalgan to Urza and Kiakhta, crossing the territory of autonomous outer Mongolia, are to pass into the possession of the Mongolian Government, in conformity with a triple agreement signed in June, 1915.

Torpedo Controlled by Wireless.—A Reuter telegram from Washington, U.S.A., states that wireless control of a coast defence torpedo by an aeroplane has been definitely accomplished, and the Navy Department has asked Congress to appropriate nearly a million dollars to acquire the rights. Aeroplane control makes it possible for the operator to guide the torpedo through the water from any height, air bubbles from the compressed air motor of the torpedo giving him a certain guide to steer it against a ship's hull. No details are available, and the method by which the controlling waves are enabled to actuate the steering gear of the torpedo, in spite of the shielding effect of the shell of the latter, and of the sea-water, is not known.

United States.—The Marconi Wireless Telegraph Co. of America has brought an action against the Detroit and Cleveland Navigation Co. at Buffalo, N.Y., for using infringing apparatus on its steamships.

The antenna of the radio-station of the Atlantic Communication Co. at Sayville, L.I., was brought down by the weight of sleet on December 29th. Repairs were made at once.

The Marconi Wireless Telegraph Co. of America has placed a contract for the erection of a new station building at Cape May, N.J. A tower 140 ft. high will also be erected.

The United States battleship *Wyoming* reports that while she was near Cape Henry, Va., on January 10th, radio-telegraph messages were exchanged with the *San Diego* at Graymas, Mexico, a distance of 2,600 miles.

Recently the Marconi Wireless Telegraph Co. of America brought an action against the American-Hawaiian Steamship Co. for infringement of its "tuning patent," by the use of certain wireless telegraph apparatus manufactured by the Kilbourne & Clark Manufacturing Co., of Seattle, Wash., which had been installed on its steamship *Floridian*. Judge Veeder, on January 8th, granted a preliminary injunction against the further use of the apparatus on the steamship.

Judge Mayer dismissed, on January 7th, the wireless patent infringement suit brought by the receivers of the National Electric Signaling Co., of Pittsburgh, Pa., against the Atlantic Communication Co., which operated the Sayville wireless station. It was complained that the defendant had infringed the claims of patents granted to Reginald A. Fessenden, but Judge Mayer held that the claims were invalid.

The Marconi Wireless Telegraph Co. of America has closed a contract with the Inland Navigation Co., New York, for the installation of wireless apparatus on 36 freight barges, which are soon to ply the waters of the Mississippi. The contract provides for 2-kw. Marconi sets, giving a communication range of 400 miles or more. Marconi operators will be supplied and service with land stations provided as in ocean navigation.—*Telegraph and Telephone Age.*

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—April 15th. P.M.G. Common-battery multiple switchboard, or automatic or semi-automatic switchboard, and associated apparatus. See "Official Notices" December 31st.

BRISBANE.—April 26th. Deputy P.M.G. Five sections of trunk line switchboard for Toowoomba Exchange. (Schedule No. 342.)

MELBOURNE.—March 22nd. Thermo-electric pyrometers, for the Victorian Government Railway Commissioners.

April 12th. Electrically operated runway hoist for the Jolimont car shops. Particulars at the contractors' room, Spencer Street.

SYDNEY.—February 28th. Municipal Council. Tenders for induction regulators. Specifications (11s. 6d.) from the Electric Light Department, Town Hall, Sydney.

April 10th. Municipal Council. Supply, laying and maintenance for six months of six 11,000-volt submarine cables, each 400 yards long, across Darling Harbour.

May 3rd. N.S.W. Railways and Tramways Department. One 2,500-KW. turbo-alternator, for Zara Street, Newcastle, power house. Specifications (20s.) from the Engineer's office, 61, Hunter Street, Sydney.

Belfast.—February 16th. Corporation. Tramway stores, including cable, lamp and electrical accessories. See "Official Notices" to-day.

Birmingham.—February 8th. Twelve months' supply of electrical stores, for the Birmingham, Tame and Rea District Drainage Board. Forms of tender from the Board's offices, Tyburn, Birmingham.

Exeter.—B. of G. Electric light installation for Block 3 at the workhouse. Particulars from the Surveyor.

Halifax.—February 14th. Corporation. Twelve months' supply of electrical lighting fittings and accessories, cables, telephone wire, meters, &c. See "Official Notices" January 21st.

Leigh (Lancs.).—February 18th. Electricity Committee. 2,000-KW. turbo-alternator, 6 600 volts; surface condenser, set of pumps, 1,000-KW. rotary or motor-converter, with switchgear. See "Official Notices" January 28th.

London.—ISLINGTON.—February 17th. B. of G. Alteration to wiring, provision of switchboards, motor starters, &c., provision of motors, and purchase of old plant. See "Official Notices" January 28th.

HAMMERSMITH.—February 16th. Corporation. Twelve months' supply of stores, including wires, cable joint boxes, fuse boxes, insulating material and electric light sundries, for the Electricity Department. See "Official Notices" to-day.

BATTERSEA.—February 21st. B.C. Engine-room stores, oils, electricity meters, service joint-boxes, ironmongery, tools, troughing, conduits, insulators, coal, &c., for the Electricity Department. See "Official Notices" to-day.

Manchester.—February 15th. Corporation. General stores, including cables, telephones, electrical accessories, &c., for the Tramways Department. See "Official Notices" January 28th.

New Zealand.—DUNEDIN.—May 17th. City Council. (1) Tramcar bodies; (2) electrical equipment. Plans, &c., from the Town Clerk, Dunedin.

RAETIHI.—March 14th. Town Board. 40-H.P. hydro-electric generating set, switchboard, &c. Plans and particulars from Messrs. H. W. Climie & Son, Raetihī.

WELLINGTON.—March 8th. Public Works Office. One 3,000-KW. generator and one 4,300-H.P. water turbine, at Lyttelton, for the Lake Coleridge electric power scheme. Specifications, &c., may be consulted by British firms at the office of the High Commissioner in London for New Zealand, at 13, Victoria Street, S.W.

Pembroke (Dublin).—February 7th. U.D.C. Twelve months' supply of electrical goods. Specifications from the Town Hall, Ball's Bridge, Co. Dublin.

Portsmouth.—February 15th. Corporation. Six months' supply of tramway stores, including insulating materials, lamps, motor windings. See "Official Notices" to-day.

Southampton.—February 19th. Corporation. Twelve months' supply of general stores, electric lamps, &c., for the Tramways Department. Specifications from the Manager, Tramway Offices, 161, Above Bar Street.

Spain.—Tenders have been invited by the municipal authorities of Anzoa (Province of Guipuzcoa) for the concession for the electric lighting of the town.

Todmorden.—February 12th. Electricity Committee. One Lancashire boiler, superheaters, mechanical stokers, pipework, centrifugal pump; also brickwork for Lancashire boiler. See "Official Notices" to-day.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Australia.—The following tenders have been accepted:—

P.M.G.'s DEPARTMENT, WEST AUSTRALIA.

7 miles 763 yards of lead-covered conductor cable, 150 pairs, £1,018 per mile; 4 miles 1,023 yards ditto, 100 pairs, £748 per mile.—Western Electric Co. (Aust.), Ltd.

P.M.G.'s DEPARTMENT, N.S.W.

3½ miles of lead-covered conductor cable, 15 pairs, £101 per mile; 9½ miles ditto, 25 pairs, £132 per mile; 8½ miles ditto, 35 pairs, £165 per mile; 33½ miles ditto, 60 pairs, £228 per mile; 9½ miles ditto, 75 pairs, £293 per mile.—W. T. Henley's Telegraph Works Co., Ltd.

14½ miles of lead-covered conductor cable, 150 pairs, £291 per mile; 1½ miles ditto, 300 pairs, £634 per mile; 5 miles ditto, 250 pairs, £778 per mile; 1½ miles ditto, 300 pairs, £320 per mile.—Western Electric Co. (Aust.), Ltd.

4 miles of lead-covered conductor cable, 400 pairs, £1,185 per mile.—British Insulated & Helsby Cables, Ltd.—Tenders.

Barking.—The U.D.C. has accepted the tender of Mr. S. E. Moss, of Southend-on-Sea, for extensions at the electricity works, at £1,200.

Bristol.—The Corporation Docks Committee has accepted the tender of Messrs. W. T. Henley's Telegraph Works Co., Ltd., for 250 yards of 7/18 paper-insulated lead-covered cable.

Derby.—The T.C. has accepted the tender of the British Electric Transformer Co., Ltd., for a transformer, at £110.

Glasgow.—The Electricity Committee recommends acceptance of the following tenders:—

British Westinghouse Co., Ltd.—One 6,000-KW. turbo-alternator and condensing plant, at £25,622, for the Port Dundas station.

Willans & Robinson, Ltd.—One 6,000-KW. turbo-alternator and condensing plant (with Dick, Kerr alternator), at £26,480, for St. Andrew's Cross station.

The above sets are to be completed by September of the present year.

The Tramways Committee has recommended acceptance of the following offers:—

V.I.R. cable—Liverpool Electric Cable Co.; Pirelli, Ltd. Commutators.—British Westinghouse Co.

Ilford.—The following offers of coal have been accepted by the Electricity Committee:—

E. Foster & Co.—100 tons Glynced through and through, at 24s. 9d. per ton; 100 tons Glynced small, at 20s. 10d. per ton; about 150 tons Moatham slack, at 18s. 6d. per ton.

Cleeves & Co.—200 tons Notts large hard, at 26s. 9d. per ton.

E. Foster & Co.—Three trucks per week of West Cannock 2-in. nutty slack, at 20s. 10d. per ton, over a period of 12 months.

The Committee has also accepted the tender of the Albion Clay Co. for cable ducts, at 2s. 4½d. per yard.

London.—L.C.C.—The Education Committee has considered a claim from Messrs. Lund Bros. & Co., the contractors for the electric lighting installation at Ocean Street School, Stepney, in respect of the rise in the prices of materials between the time of the acceptance of their tender and the execution of the work. The contract was accepted in December, 1913, and the first portion completed in 1915; the second portion has only recently been commenced, owing to the building trade strike in 1914. The Committee is of opinion that an allowance of £39 should be made in settlement of the claim; and also that the request of Messrs. Defries and Goldman, contractors for installing electric light at Star Street School (Fulham), Victoria School (Hammersmith), Senior Street School (Paddington), and Woolmore Street School (Poplar), for permission to assign their contracts to the Alpha Manufacturing Co., be complied with.

West Bromwich.—The Electricity Committee recommends the acceptance of the tender of Messrs. J. Dallow & Sons, at £8,850, for the erection of the engine-room walls and foundations and brickwork for steel chimney, in connection with the plant extensions at the electricity works; also the tender of the New Conveyor Co. for certain extensions to the coal conveyor.

Windsor.—Messrs. Chamberlain & Hookham, Ltd., have received the contract for the supply of electricity meters for the coming year.

Whitby.—The contract for laying cable and installing the electric light (approximately 65 lights) at Smeaton Castle, for Col. J. W. Richardson, has been secured by Mr. Isaac Stephenson, of Whitby.

FORTHCOMING EVENTS.

- Greenock Electrical Society.**—Friday, February 4th. At 7.15 p.m. At the Temperance Institute, 19, West Stewart Street. Paper on "Cohlyry Electrical Installations," by Mr. R. Gordon Campbell.
- Saturday, February 12th.**—Visit to blast furnaces at the Govan Iron works of Messrs. Wm. Dixon, Ltd.
- London Association of Foremen Engineers.**—Saturday, February 5th. At 8 p.m. At Cannon Street Hotel, E.C. Lecture on "Superheated Steam," by Mr. T. Sugden.
- Society of Engineers.**—Monday, February 7th. At 5.30 p.m. At Caxton Hall, Westminster, S.W. Presidential address by Mr. P. G. Illiths. Presentation of premiums.
- Institution of Civil Engineers.**—Tuesday, February 8th. At 5.30 p.m. At Great George Street, S.W. Paper on "Notes on the Working of a Rack Railway," by Mr. W. T. Lucy.
- Liverpool Engineering Society.**—Wednesday, February 9th. At the Royal Institution, Colquhitt Street. Paper on "The Education of a Marine Engineer," by Mr. J. E. Jelchery.
- Association of Engineers-in-Charge.**—Wednesday, February 9th. At 7.30 p.m. At St. Bride's Institute, Bride Lane, E.C. Paper on "Multiple-Effect System of Refrigeration," by Mr. W. Stokes.
- Royal Society of Arts.**—Wednesday, February 9th. At 1.30 p.m. At John Street, Adelphi, W.C. "The Organisation of Scientific Research," by Prof. J. A. Fleming, F.R.S.
- Institution of Electrical Engineers.**—Thursday, February 10th. At 8 p.m. At Victoria Embankment, W.C. Paper on "The Testing of Underground Cables with Continuous Current," by Mr. O. L. Record.
- Western Local Section.**—Monday, February 7th. At 5.30 p.m. At the South Wales Institute of Engineers, Park Place, Cardiff. Paper on "The Testing of Underground Cables with Continuous Current," by Mr. O. L. Record.
- Manchester Local Section.**—Tuesday, February 8th. At 7.30 p.m. At the Engineers' Club, 17, Albert Square. Paper on "The Testing of Underground Cables with Continuous Current," by Mr. O. L. Record.
- Scottish Local Section.**—Tuesday, February 8th. At 7 p.m. At Prince's Street Station Hotel, Edinburgh. Paper on "The Principles of Modern Printing Telegraphy," by Mr. H. H. Harrison.
- Yorkshire Local Section.**—Wednesday, February 9th. At 7 p.m. At the Philosophical Hall, Leeds. Paper on "The Testing of Underground Cables with Continuous Current," by Mr. O. L. Record.
- Manchester Association of Engineers.**—Saturday, February 12th. At the Grand Hotel, Aytoun Street. Paper on "Oil Engines," by Mr. G. E. Windeler.
- North of England Institute of Mining and Mechanical Engineers.**—Saturday, February 12th. At 2 p.m. At Neville Hall, Newcastle-on-Tyne. General meeting.

THE B.E.A.M.A. ANNUAL MEETING.

The annual general meeting of the B.E.A.M.A. was held at the Connaught Rooms on Thursday, January 20th. Mr. F. R. Davenport (Willams & Robinson, Ltd.), chairman of the Council, presided, and we learn that there was a good attendance of members.

In submitting the annual report and balance-sheet, the chairman said that notwithstanding the handicaps under which members were suffering due to shortage of labour, difficulties in obtaining materials, Government control, &c., they had compared with some other trades, no reason to be dissatisfied with the situation.

Public attention was at the present time being largely directed to the question of the probable situation after the war, and several associations purporting to look after that matter and working more or less on parallel lines had sprung up. The B.E.A.M.A. had been invited to join some of these associations, but up to the present had not done so, though they had given considerable time to the exchange of views and the holding of conferences, and were still directing their attention to the efforts made towards creating some central and representative body which would embrace the common interests of all British traders. Suggestions had been made by the B.E.A.M.A. to the Colonial Office that money raised within the Empire should be expended on British goods, and whilst the Secretary of State for the Colonies was unable to give any definite assurance, there appeared now to be a far more favourable atmosphere surrounding the whole question of Colonial and Allied trade.

The Association had been in conference with the Advisory Committee of the Commercial Intelligence Department of the Board of Trade, to whom memoranda had been submitted, many of the recommendations put forward being the Chairman understood, embodied in the report made by this Committee. That looked as if things were tending in the right direction. They had been in conference with the Government Research Committee, which was appointed by the Board of Education to inquire into the broad question of scientific and industrial research and for the granting of sums of money in aid of research. Although he had nothing to say at the moment as to probable results, their Committee was a strong one, and there was every sign that good results would flow from the effort. With a view to organising and extending the export work of members, additions had been made to the export staff, and Overseas Committees had been appointed in India, Australia and South Africa. Others, it was hoped, would be shortly appointed. The *Technical Journal*, which had a wide overseas circulation, was used by members as a publicity missionary for export trade and, with the object of discussing ways and means of bringing about co-operative effort, both in the home and export sides of the industry, which were, of course, very intimately interlinked, recently a series of informal evening gatherings had been held. As the report told them, home conditions of contract and standardisation still remained amongst their fundamental activities,

and they had been actively engaged in these directions. He thought they might say, without any undue pride, that their position as an Association, both nationally as well as in relation to their own trade circles, had been strengthened without in any sense alienating, as far as he was aware, customers' minds and their general opinion of the B.E.A.M.A.

In the discussion which followed, Mr. LUNDBERG (A. P. Lundberg & Sons), Mr. LONGBOTTOM (Electromotors, Ltd.), and Mr. BERRY (Berry, Skinner & Co.) referred to the unsatisfactory position in regard to patents. Practically all members were now controlled firms, and their patents were naturally in a state of suspension, although patent fees had to be paid. This meant that the useful life of the patent would be shortened by the duration of the war. It was considered that notwithstanding the unsympathetic attitude of the Board of Trade the matter should be persevered with.

The report was adopted.

Messrs. Callender's Cable and Construction Co., Ltd., were elected members of the Council.

NOTES.

Two Interesting Problems.—The Christmas number of the *Wireless World* contained the following solutions to the cube problem (which we reproduced in our last issue), by a correspondent, Mr. W. B. Ferguson:—

If the cube be imagined to be pulled apart from points *e* and *c*, fig. 1, all confusion at once vanishes, as the cube assumes the shape shown in fig. 3, from which it is obvious at a glance that we have three in parallel (*W-X*) in series with six in parallel (*X-Y*) in series with three in parallel (*Y-Z*); therefore the resistance from *e* to *c* is one-third plus one-sixth plus one-third. Answer: Five-sixths of an ohm.

Alternative Problem (sides made of 1-ohm sheets).—In fig. 1 the current entering at *e* divides equally between top, front, and left side (*a b f g*; *c f g h*; *e a d h*), each of 1-ohm resistance, therefore one-third of an ohm total. The current leaves by three sheets—bottom, back, and right side (*c d h g*; *e d a b*; *e b f g*), each of an ohm resistance, therefore one-third of

FIG. 1.

FIG. 2.

an ohm total. The first set of sheets joins direct with the second lot of sheets along the line *a, b, f, g, h, d, a*; therefore we have one-third of an ohm in series with one-third of an ohm. Total, two-thirds of an ohm.

We have received from Mr. W. N. Y. King, A.C.G.I., solutions on similar lines, leading to the same conclusions.

With regard to the second part of the cube problem, although both solvers arrive at the same result, we are unable to agree that the solution is correct. In point of fact, on consideration of the conditions—a cube constructed of sheet metal, with current led in and out by diagonally opposite corners—we have come to the conclusion that the problem is one of considerable difficulty. The solvers appear to assume that the resistance of one side is one ohm, no matter in what direction the current passes through it, but this

FIG. 3.

is clearly an inadmissible assumption. It must, of course, be taken that the sides are in contact along every edge; and the resistance of each side from edge to edge is 1 ohm—if it is taken diagonally it becomes indeterminate.

As the solution to the second problem (the two steel rods) will be published by our contemporary this week, we shall not be guilty of discourtesy if we include it here:—Gently apply one end of bar *A* to the middle of bar *B*, and separate the bars again. If there is magnetic attraction between them, as indicated by "stickiness," *A* is the magnet; if no attraction is felt, obviously *A* is not magnetised, and therefore, *B* is the magnet. A symmetrically magnetised bar, having two poles only, has no external magnetic field at its median plane. Mr. King solved this problem correctly.

"Jitney" Competition in America.—Full reference has recently been made in our "City Notes" to the serious effect of unlicensed jitney bus competition upon the traffic of the British Columbia Electric Railway Co., Ltd., a competition which may have far-reaching results, including the closing of some of the tramway sections. We now read in the British Consular Report for the district of Portland, Oregon, U.S.A., that this kind of service has also been making its influence severely felt in other places as well, and has got to be reckoned with in the future. The writer of the report says that in the last six months of 1914 the street car service of most of the United States, but especially on the Pacific Coast, was hard hit. "In Portland the company that has control of the street railways and supplies most of the electric current for household and commercial purposes, mostly consists of Eastern States capital, and is not so much affected by loss in passengers on the cars, as that is only part of the revenue, but companies which have no other earning power are very much affected. A few months ago a number of automobiles of different makes, sizes and conditions started to compete for the passenger service on the streets where cars run. It was vulgarly termed the 'Jitney' service, after a name given to the 5 cent. (2½d.) coin used, and grew with leaps and bounds, as many people who used automobiles to get to work, and for occasional business journeys during the day, would put up a sign for passengers on their way to work and in the evening home. Some women who own automobiles, and have no house or family, have gone into the business, which the city authorities are now endeavouring to regulate, as the loss in revenue to the city is quite great, and some of the 'Jitney' drivers are incompetent and wild. The new system is a great comfort to many people, because, as soon as a car, say, carrying five persons, is filled, they take short cuts through the residential district, not being interfered with by the car tracks and heavy wagons on the main streets, and a man reaches his office or home in half the time he would on a street car, and, if convenient to the others in the car, can on wet days be put off at his office or house. One result of the 'Jitney' outbreak has been the faster running of the street cars, which formerly were very trying to a nervous man who was in a hurry. Many people interested in this new business say that the big heavy automobiles with a large carrying capacity will soon die out from the expense of fuel and upkeep, while the cheap car, built for economy and carrying from four to seven passengers, will make a living for their drivers and expenses. The cost of taxicabs here is very great. Many of the 'Jitneys,' neat looking cars, can be hired for a trip to the station for about a quarter what the taxicabs charge, and for less than half by the hour for an afternoon's trip, so it is to be hoped that the regulations on them will not be too severe. One regulation suggested that all licensed 'Jitneys' must have the name of their route painted on them, must keep on a fixed route, must not run on a street where a street car runs, not get off the route laid down, and all be at work from 6 to 10 a.m., and from 4 to 11 p.m., notwithstanding weather or sickness of owner, who is generally driver. Investors in such undertakings as street railroads must look forward to the changes in methods of transportation, and are likely to suffer, as their predecessors the horse-tram, bus and cab companies did."

Institution and Lecture Notes.—**Illuminating Engineering Society, U.S.A.**—This Society holds its mid-winter convention in New York, on February 10th and 11th. The programme of papers includes the following:—Relation of Lighting to Architectural Interiors; Candle-Power Measurements of Series Gas-Filled Incandescent Lamps; Theatre Lighting; Illuminating Engineering Photographs: The Lighting of Important General Offices in New York City; An Interlaboratory Photometric Comparison of Glass Screens and of Tungsten Lamps, involving Colour Differences; The Box Photometer; and a Lecture on the Lighting of the Panama Pacific Industrial Exposition.

Wolverhampton and District Engineering Society.—On Friday last, Mr. C. Jones, chief electrical engineer to the Cannock Chase Collieries, gave an interesting lecture to the Society on the application of electricity to the working of collieries.

Nottingham Society of Engineers.—At a joint meeting of the Society with the Association of Mining Electrical Engineers, Mr. R. A. Sheldon read a paper on the use of electricity in conveying coal from the working face to the pit-head.

Leeds Association of Engineers.—At a meeting on Thursday last week, Mr. G. Wilkinson, electrical engineer to the Corporation of Harrogate, read a paper on the use of electricity as a means of conserving our coal measures; he pointed out that the enormous drain upon the Empire in men, money, and materials, occasioned by the war, had emphasised the need for thrift and economy in all directions. One of this country's chief assets was coal, and economy in its use and consumption was very needful. About one-tenth of all the coal raised in these islands was burned in private fires. A great saving could be effected at once by abandoning the wasteful open fire in favour of other more economical forms of heating, such as hot-water radiators. On banishment of the open fire, the supplemental heating of the living rooms would take the form of electric fires or gas stoves, thus effecting great economy both in fuel and in labour.

Belfast Association of Engineers.—On January 21st an address was delivered by Mr. W. Pleasance, on "Three-Phase Current for Power Purposes." The lecturer dwelt on the advantages of the three-phase system as compared with direct current for power and lighting, and a discussion followed. According to the *Belfast News-Letter*, the Chairman, Mr. J. W.

Kempster, said that, broadly speaking, they ought never to put in a d.c. machine if they could put in a three-phase plant; but they must give due weight to the purpose in view, and not install three-phase merely for the sake of three-phase. Individual driving in an engineering works he said, was undoubtedly the most economical in the end. The introduction of electrical driving was one of the ways in which they would have to make good the wastage of capital caused by the war; properly applied, it enabled them to get the utmost possible out of the man and the machine, and greatly increased the productivity of their factories and workshops.

Decimal Coinage.—In our contemporary *Nature* for January 20th, a writer using the initials "G. H. B.," who is clearly an ardent supporter of the metric system, takes us to task because, in our recent article on "Decimal Coinage and the Metric System," we "associated these undoubted claims for standardisation of units with the advocacy of a change of monetary system which nobody understands, and which does not appear calculated to advance the cause of international uniformity." He goes on to say that the result of our inquiries of business firms was "a very thorough discussion of the advantages of the metric system, and the absence of any substantial evidence regarding the monetary question," and afterwards demonstrates that the decimal system of weights and measures in international use is based on a distinctive and unique nomenclature for tens, hundreds, thousands, and corresponding submultiples of the fundamental unit, whereas most systems of coinage are centesimal, and chaotic at that.

Our critic, who has evidently only glanced at parts of the article in question, omits to mention that we explicitly stated in several places that we regarded the adoption of the metric system in this country as of the first moment, and that the adoption of decimal coinage was an independent question of secondary importance, its chief recommendation being economy of clerical labour. Apparently "G. H. B." bases his sweeping statement to the effect that "nobody understands" the system upon his own lack of comprehension of it, which is a somewhat shaky foundation; but we did not advocate decimal coinage with a view to international uniformity in this respect, an ideal which is obviously unattainable. The writer goes on to dilate upon the disadvantages of such uniformity of coinage, thus unconsciously supporting our proposal that we should not adopt the franc or anything of equivalent value, but should base our system upon the pound sterling and its decimal submultiples, the florin being about twice the value of the mark, and two and a-half times the value of the franc, lira, &c. He further supports our contention that the exchange value of an English sovereign is known all over the world, and states that our manufacturers can at present give their quotations in decimals of a pound—yet he does not seem to understand that the system we propose achieves precisely that very end, without the necessity of reducing shillings and pence to decimals of a pound!

Instead of realising that the present is an ideal time for introducing a change in coinage, when our normal standards of value have gone overboard, and the slight change of 4 per cent. in the value of copper coins only would be unfelt, "G. H. B." thinks "it is quite clear that any such change would lead to a state of chaos in our international trade"—although he has himself stated that the value of the sovereign is known all over the world, and our proposal is to convert our coinage to sovereigns and decimals of a sovereign, which, he says, can easily be done! If "G. H. B.'s" arguments are to have any weight, they should be *l.s.* at war with one another; a writer who puts forward statements on the "it-is-quite-clear" basis, when his own arguments demolish one another, and exhibit a confusion of thought deplorable in one who assumes the office of a critic, can hardly hope to secure the approval of anyone but his adversaries.

Fatalities.—An inquest was held at Leigh, on Thursday last week, on Richard Tinsley, aged 45, an electrician employed at the Bickershaw Collieries of Messrs. Ackers, Whitley & Co., who met with a fatal accident at the pit on the previous day. He had been engaged in repairing some wire in the 7-ft. shaft, about 10 yards below the surface, and, according to the evidence of Henry Collier, assistant electrician, the job had been finished. They told the banksman they had done with the cage. A few minutes later it was lowered, and Collier heard a crash. The cage was stopped and brought to the surface. The body was subsequently recovered from the sump-hole in a mutilated condition. A verdict of "Accidental death" was returned.

The Burnley Coroner held an inquest, on January 24th, concerning the fate of Alfred Dixon, of Manchester, foreman electrician for the L. & Y. Railway Co., who was knocked down by a train near Gannow Junction. Deceased was repairing some of the wires close to Gannow Junction when the fatality happened. He had been employed by the Railway Co. for 21 years on this class of work. The jury returned a verdict of "Accidental death."

Municipal Employés and Compulsory Service.—At the meeting of the Birmingham City Council on Tuesday last, the General Purposes Committee recommended that the privileges granted to the officers and servants of the Corporation who had joined the naval and military services should be extended to those men who were taken by compulsion for service. An amendment was moved by Alderman Davis that the report be referred back for further consideration. He submitted that the Corporation would not be keeping faith with those men who had voluntarily enlisted if equal advantages were given to those who were conscripted. This was the feeling of the majority of the Council, and the amendment was carried.

Appointments Vacant.—Junior engineers-in-charge (12s.), and switchmen (85s.) for the Newport Corporation Electricity Department. See our advertisement pages to-day.

Electrical Rain-Making.—The Committee appointed by the N.S.W. Premier to inquire into Mr. Balsillie's proposals for causing rain by electricity has now reported. The essential features of the proposal were the use of an electrically charged, metal-coated captive balloon, the suspending of a Röntgen-ray tube from it, and the combination of the electrically-charged body and the Röntgen-rays. The Committee reports that after experiments it was not satisfactorily established that Mr. Balsillie had succeeded in making any definite advance towards attaining practical results, but recommends further investigation of the subject, with a view to the carrying out of open-air experiments in New South Wales.—*Sydney Evening News*.

Volunteer Notes.—ENGINEERING INSTITUTIONS' VOLUNTEER ENGINEER CORPS.—Orders for week commencing February 7th, 1916.—By Lieut.-Col. O. B. Clay, V.D., Commandant.

Drills, 6.25 to 7.25; 7.25 to 8.25 p.m.

Sunday, February 6th.—Trench Work Train, 9.35 a.m. Cannon Street.

Monday, February 7th.—Sections 1 and 2, Technical; Sections 3 and 4, Lashings and Trestle Bridging, Signalling Class and Recruits.

Tuesday, February 8th.—School of Arms, 6 to 7 p.m.

Thursday, February 10th.—Shooting for Sections 1 and 2 and Signalling Class.

Friday, February 11th.—Sections 3 and 4, Technical; Sections 1 and 2, Lashings and Trestle Bridging; Signalling Class and Recruits.

Saturday, February 12th.—Uniform Parade, 2.45 p.m.

Sunday, February 13th.—Signalling Section. For particulars see Notice Board.

E. G. FLEMING,

Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON REGIMENT (VOLUNTEERS).—Battalion Orders by Colonel S. G. Grant (Officer Commanding), Thursday, February 3rd, 1916:—

Week-end Parades.—*Saturday.*—The Battalion, less Platoons Nos. 8, 11, North London and Blackheath, will parade at Wembley Park at 3.15 p.m. "Derby" recruits are invited to attend.

Sunday.—(The first Sunday in the month).—Field Operations. The Battalion will parade at 9.30 a.m., at King's Cross Station, G.N.R., and proceed to Hatfield Park. Members are requested to purchase their tickets before the hour appointed for parade, and to provide themselves with White hat-bands. Lunch will not be provided by the Corps, but the Quartermaster will make arrangements to provide light liquid refreshments. The 3rd Battalion Hertis, V.T.C. have kindly arranged to provide Tea, at a very small cost, after the Operations.

The Battalion will return to town at 5.22 p.m.

Musketry.—The Inter-Platoon Competition will be continued at the Acton Range on Saturday next, the 5th inst., in accordance with the orders published on Monday last. The competing platoons Nos. 8, 11, North London and Blackheath, to parade punctually at 1.30 p.m. in uniform with bayonets.

A. G. JOINER, Major and Adjutant, O.B.C.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—The Preston Corporation has appointed Mr. H. ALSTON, of Blackburn, to the position of chief traffic clerk in the tramways department.

Mr. F. MAWDESLEY, assistant engineer at the Plumstead electricity works of the Woolwich Borough Council, has been promoted acting charge engineer at £110 per annum.

Mr. J. DUGDALE, the Oldham Corporation tramways manager, who, as recently reported, met with an accident at Rotherham, has now returned to Oldham.

General.—The Curtis Manufacturing Co., Paddington, inform us that their principal, Mr. F. C. CURTIS, after putting in seven months' signal work with the Royal Naval Division, R.E., in the trenches at Gallipoli, is now at — in charge of the motor cycle maintenance for the Division. The company's business is being carried on as usual in his absence.

The *London Gazette* Territorial Force cancellation notice which, in our last issue, was bungled by the printer when making corrections, should have read as follows:—"Captain (temporary Major) Arthur E. Levin; Second-Lieutenant (temporary Captain) George L. L. Russell; Lieutenant (temporary Captain) Hugh C. C. Tufnell; Second-Lieutenant (temporary Lieutenant) Frederick H. Bowers."

The marriage has taken place at Luton of Mr. WM. THOS. GODDEN, chief electrician at the Royal Naval Hospital at Chatham, and Miss Alice Molland.

The marriage took place on January 22nd, at St. Botolph's Church, Bishopsgate, E.C., of Sapper BERTRAM GODDARD,

electrical engineer, of the London Electrical Engineers, and Miss Gladys Ransom, of Woodford.

From the *London Gazette*.—"Territorial Force: Royal Engineers. *Type Electrical Engineers.* To be Second-Lieutenants on probation:—W. W. Wilson, Private J. B. Murray, from the Artist Rifles O.T.C."

Mr. L. W. PHILLIPS, A.M.I.E.E., late of the technical staff of the Edison & Swan Laboratory, London, Ltd., has been appointed manager of the advertising and publicity department of the Electrical Supplies Co., of Tottenham Court Road, London, W.

On Saturday, March 11th, a wedding will take place, very quietly, at Heme Hill, between HENRY COBURN TURNER, of the British Westinghouse Co., Ltd., Trafford Park, son of Mr. William Turner, of Westbrook, Eccles, and of Bessie Mary, daughter of Mr. William Noble, assistant engineer-in-charge of the G.P.O., of Roselea, Barbage Road, Heme Hill, S.E.

Councillor JAS. O'NEILL has been re-elected chairman and Councillor McGINNESS has been elected vice-chairman of the Dublin Corporation Electricity Committee.

Roll of Honour.—The February number of the *Journal* of the Institution of Electrical Engineers contains a list of awards to members and students for service in the field as follows:—

Lieutenant-Colonel J. C. CHAMBERS, member, and Brigadier-General A. M. STUART, member, have been made Companions of the Bath.

Major F. J. CHAPPLE, assoc. member, Major S. H. COWAN, assoc. member, Captain A. E. DAVIDSON, assoc. member, and Captain H. M. LEAF, member, have each received the D.S.O.

Lieutenant-Commander E. G. ROBINSON, assoc. member, was awarded the V.C. last August for conspicuous bravery in Gallipoli.

The Military Cross has been conferred upon:—Second-Lieutenant O. H. GOULDEN, assoc. member; Lieutenant H. R. L. GROOM, graduate; Lieutenant H. J. GWYTHYR, student; Captain H. P. T. LEFFROY, assoc. member; Lieutenant I. W. MASSIE, assoc. member; Lieutenant A. PODMORE, assoc. member; Second-Lieutenant O. W. SHERWELL, student; Lieutenant A. R. TABOR, student; and Second-Lieutenant G. W. WILLIAMSON, assoc. member.

The Distinguished Service Cross was won by Lieutenant E. G. BOISMIST, assoc. member.

The D.C.M. has been awarded to Private A. M. DODG, assoc. member; Private P. J. WOOD, student; and Corporal C. W. SAUNDERS, graduate.

Sapper J. H. MURRAY, assoc. member, has received the Distinguished Service Medal.

Seventeen gentlemen in the different classes of membership have been mentioned in dispatches.

The *Journal* contains a further list of members on military service, with particulars of promotions, transfers, &c.

Second Corporal H. E. GOVEY, of the 67th Field Company, Royal Engineers, reported killed in action in Gallipoli, was for several years engaged with the British Thomson-Houston Co., Ltd., at Rugby, and when he enlisted was on the staff of the testing department.

Corporal HORACE POWELL, of the 9th Battalion King's Royal Rifles, who was, before the war, on the Rugby staff of the British Thomson-Houston Co., Ltd., is reported missing.

Rifleman T. A. TAYLOR, of the 21st London Regiment, and late of the staff of Messrs. Siemens Bros., of Charlton, S.E., has been mentioned in dispatches for gallant conduct at Loos.

Private A. V. PIPE, of the 1/20th London (Woolwich and Blackheath) Regiment, who was with Messrs. S. W. Gibson and Co., electrical engineers, of High Street, Dartford, is officially notified to have been killed in action on May 26th last. For many months he had been posted as "wounded and missing."

Private HUGH KADY, of the 11th Battalion Manchester Regiment, who has died from dysentery contracted at Gallipoli, was employed prior to the war by the Lancashire Dynamo Co., Ltd., Trafford Park.

Private J. E. PEPPIN, of the 7th Lancashire Fusiliers, who, prior to the war, was employed at the British Westinghouse Works, Trafford Park, has been killed in action.

On Monday, the Deputy Lord Mayor of Manchester presented Private J. O'CONNOR, of the 8th Manchester, formerly employed in the tramways department, with the D.C.M., which he has won for conspicuous gallantry under heavy fire.

Obituary.—MR. H. M. O'KELLY.—"Nature" states that the death is announced, at the age of 69 years, of Mr. H. M. O'KELLY, formerly superintendent of Government telegraphs in India. He joined the Indian Telegraph Department in 1866, was appointed superintendent in 1886, and retired in 1898.

COLONEL ROBERT HAMILTON VETCH.—The *Morning Post*, in announcing the death of Colonel Robert Hamilton Vetch, late of the Royal Engineers, at the age of 75, states that an interesting incident in his life occurred in 1869, when he was sent by the Government in the *Great Eastern* to report on the laying of the French Atlantic cable from Brest to St. Pierre and thence to Duxbury, Mass.

Will.—The late Mr. G. A. SCOTT, a director of the North of Scotland Electric Light and Power Co., Ltd., left £14,533.

NEW COMPANIES REGISTERED.

W. J. Burroughes and Sons, Ltd. (142,842).—This company was registered on January 26th, with a capital of £5,000 in £1 shares, to take over the business of a heating and lighting engineer carried on by W. J. Burroughes, at 143 and 144, Holborn, E.C., as W. J. Burroughes and Sons, to carry on the business of heating, ventilating, and electrical engineers, plumbers, manufacturers of and dealers in appliances, etc. The subscribers (with one share each) are: W. J. Burroughes, 143 and 144, Holborn, E.C., engineer; and S. H. Burroughes, 143 and 144, Holborn, E.C., engineer. Private company. The number of directors is not to be less than two or more than five; the first are W. J. Burroughes (permanent governing director, special qualification, 1,000 shares) and S. H. Burroughes. Qualification of directors, 400 shares. Remuneration of governing director, £300 per annum. Registered office: 143 and 144, Holborn, E.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Torpoint Electric Supply Co., Ltd.—Particulars of £1,500 debentures created January 4th, 1916, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1906, the amount of the present issue being £250. Property charged: The company's property, present and future, including uncalled capital. No trustees.

Costa Rica Electric Light and Traction Co., Ltd. (56,447).—Capital, £130,000 in £1 shares. Return dated January 30th, 1916. All shares taken up; £7 paid; £129,993 considered as paid. Mortgages and charges: £286,650.

CITY NOTES.

London and Suburban Traction Co., Ltd.—The directors have declared a dividend at the rate of 5 per cent. per annum on the cum. pref. shares for the past half-year.

Blackpool and Fleetwood Tramroad Co., Ltd.—A final dividend of 4½ per cent. per annum, making 6½ per cent. for the year, is recommended, placing £615 to depreciation reserve, £5,499 to general reserve, writing down investments £995, carrying forward £4,250.

Traction and Power Securities Co., Ltd.—The directors recommend a dividend of 4s. 6d. per share, free of income-tax, on the ordinary shares for the year.

India.—The United Provinces Electric Supply Co., Ltd., is the name of a new undertaking which has lately been formed in Calcutta with a capital of 1,550,000 rupees.

South London Electric Supply Corporation, Ltd.—The directors have declared, subject to final audit, a dividend on the ordinary shares at the rate of 5 per cent. per annum for the year 1915, with a carry-forward of £2,900. Last year the dividend was at the same rate.

Yorkshire Electric Power Co.—Dividend on the ordinary shares, 1 per cent. for 1915.

National Gas Engine Co., Ltd.—Dividend on the ordinary shares, 7½ per cent. for 1915.

Winnipeg Electric Railway Co.—Dividend, 2 per cent. for the quarter ended December, 1915.

City of Buenos Aires Tramways Co. (1904), Ltd.—Balance dividend of 1s. 3d., making 5 per cent. for the year.

Metropolitan Railway Co.—The directors announce a dividend upon the ordinary stock for the past half-year at the rate of £1 per cent. per annum, making 1 per cent. for the year.

STOCKS AND SHARES.

TUESDAY EVENING.

The latest departure—it will no longer be latest at the end of this week—is the removal of minimum prices from several scores of stocks in the Colonial market which, since the opening of the Stock Exchange, have been protected in this manner by the Treasury regulations. Its effect upon the other parts of the Stock Exchange is marked by dullness in most gilt-edged securities, in consequence of the widening of the area of choice thrown open to the investor.

Home Railway gilt-edged stocks are still hedged round by the minimum prices, as are also a few Government stocks; and strong criticism is launched against the Treasury for not carrying out their plan at one fell swoop. Retention of minimum prices in the cases quoted simply serves to accentuate the confusion and uncertainty that were bound to arise; and if the Treasury had done away with the minima at one operation, it would have been better for investment all round.

The first of the electricity supply companies' dividends are now announced. The Westminster Co. is paying at the rate of 9 per cent., which gives 7 per cent. for the year—a reduction of 2 per cent. as compared with this time in 1915. The St. James' and Pall Mall has brought its year's dividend up to 8 per cent.—a reduction in this case also of 2 per cent. The other West End companies are expected to follow suit, and for some such falling away as this the market has been prepared by intelligent anticipation.

Prices have not moved at all. If dealers are asked how it

happens that the quotations keep so comparatively steady, the answer always is that it was thoroughly well recognised that reductions of this sort could hardly be avoided. At the same time, the effect has been to make the shares a little more difficult to sell than they were previously; and probably, by the time that all the companies have announced their dividends, the changes in prices caused by the declarations will be practically nil. On the other hand, it is hardly likely that people will be eager to buy the shares, having regard to the lowered rate of return and the competition which it meets from Government borrowings.

Home Railway dividends are also beginning to make their appearance, and that of the Metropolitan was one of the first to be posted. The company is paying at the rate of 1 per cent., making 1 per cent. for the year, which is ½ per cent. less than that for the corresponding twelve months. The price of the stock gave way, and Districts dropped in sympathy. Metropolitan Surplus Lands receives 2½ per cent., the same as usual. Underground Electric, however, have kept firm, notwithstanding depression in the prices of the Home Railway market as a whole, and the company's 6 per cent. income bonds maintain a very steady position about 83½.

The London & South-Western started its extended electrified train system on Monday, and, as it happened, could scarcely have chosen a more inauspicious day, having regard to the darkened conditions under which trains had to run in the evening in consequence of the Zeppelin visit to the provinces. The only people who failed to see a rather humorous side to the business were the travellers using the line during the affected hours. One of the most inexplicable developments to the ordinary layman was the stoppage of the lifts at some of the stations on the City & South London, but this was not the only thing which gave rise to some wonderment on that evening.

Brazil Traction has gone back to 5½, although as this is ex dividend, the actual fall is trifling. The company is doing well, and for the eleven months to the end of last November the published earnings show an increase over those of 1914 of two million milreis. Even with the exchange as low as 11½d., it is thought that the company will be able to maintain 4 per cent. dividend, at any rate, which would give a return of 7½ per cent. on money invested at the present price.

The Canadian and American power companies are mostly doing well, good November statements being issued, e.g., by Shawinigan Water & Power, Mississippi River Power, and Pennsylvania Water & Power companies. There is not much business passing in these; but when the Americans have bought their own railway stocks up to comparatively small-yielding levels, the prosperity of the States will undoubtedly bring industrials to the fore and may easily cause active demand for this class of investment.

Americans during the last few days, however, have been on the dull side—partly because of labour troubles, partly because of President Wilson's brave words to Germany. Not that anybody on this side pays much heed to the latter, but the Americans themselves have stopped buying shares for a time, probably because the prices which most of the active securities have attained are already high enough. American Marcoms have gone back with the rest of the list, reacting to 16s., while Canadians are also a dullish spot at 6s. 3d.

Anglo-American Telegraph preferred has risen a point. Eastern Extensions are ½ up, and so are Globe ordinary. The debenture stocks in this section are lower: this is due to the removal of the minimum prices, as mentioned in the first paragraph. With Colonial Government stocks reduced to figures at which they pay 3½–5½ per cent. on the money, industrial securities have had to come down in sympathy. In favour of the latter, it may be pointed out that in most cases they are irredeemable, whereas the others are terminable at fixed dates. This will give the first-mentioned class a decided advantage in the days when money becomes cheap and investment stocks start to rise once more. For the time being, however, it is bound to weigh heavily upon fixed-interest stocks, particularly of the kind to which industrial debentures belong.

The Mexican position is no better, so the prices for Mexican utilities are again easier. With President Wilson's mind concentrated upon the European War, it is thought that he will have no time to carry out any constructive policy of amending Mexican conditions. Therefore all of the stock and shares connected with the country are weak, and in too many cases unealeable.

British Westinghouse preference have gone back 1s. 3d. to 43s. upon more cautious views prevailing as to what the next dividend is likely to be. Henleys rose 5s. to 13½, and Telegraph Constructions are ½ up at 36, this market as a whole being a strong one. Iron and Steel shares throughout are firmly held.

The armament section is in more favour. Rubber shares gave way with the price of the raw product, the latter dropping below 5s. and causing some of the recent optimists to take sudden fright, and to sell their shares. At the same time, the decline in rubber brought about a cessation of the buying, with the result that business fell away to a fourth or fifth of what it was ten days ago. The check will do no harm, if it helps to nip in the bud the gambling spirit that was on the increase day by day; and the proprietors of shares in good-class rubber companies need feel no anxiety on the score of their concerns doing excellently well though rubber may drop to half-a-crown per lb.

Electric Industrial Vehicles in the U.S.—According to some information just to hand, there are at present no fewer than 24 concerns in the United States building electrical motor vehicles of the industrial type. The number of different models constructed is 53, ranging in capacity from 7 cwt. to 9 tons.

Callender's Hospital Fund.—On Monday last, at the Belvedere Works of Callender's Cable and Construction Co., Ltd., the thirteenth annual report of Callender's Hospital and Distress Fund was unanimously approved. Despite the war and all its disturbing influences the work of the Fund was well sustained during 1915. A large number of members had joined the Colours and naturally subscriptions showed a decrease. The highest sum on record has been, on this occasion, voted to the hospitals. The penny weekly subscriptions amounted to £370 against £281 in the previous year. The Committee resolved not to appeal to the donors this year owing to the war demanding so many calls. The awards to hospitals and other institutions were £285. The report gave particulars of the number of hospital letters issued, and the number of special home-nursing letters granted, and stated that a large number of applicants were supplied with surgical appliances, spectacles, convalescent home letters, and financial assistance.

METAL MARKET.

Fluctuations in January.

MUNICIPAL ELECTRICITY SUPPLY AT JOHANNESBURG.

By R. TURNBULL MAWDESLEY.

(Continued from page 101.)

Boiler Plant.—The boiler house, which runs parallel with the engine-room, at present contains 16 boilers in all, 14 being of the standard land type and one of the standard marine type, by Messrs. Babcock and Wilcox, all with integral superheaters; and one "Bettington" atomised-fuel boiler, with superheater and economiser. The steaming capacities of the boilers are approximately as follows:—

3	B. & W. Land type, each of 500 H.P., 7,000 lb. per hour.
7	" " " 750 H.P., 11,000 " "
4	" " " 1,000 H.P., 17,000 " "

The B. & W. marine type boiler has a capacity of 34,000 lb. per hour, and has a sack with the Prat induced-draught system, and an economiser placed above the boiler. All the above boilers have chain grates electrically driven.

The "Bettington" boiler, designed by the late Lieut. Claude Bettington, is not, so far as the writer is aware, very well known in Great Britain, and in view of this a brief description will not be without interest.

This boiler is capable of evaporating 34,000 lb. of water per hour, at 180 lb. pressure, with feed-water at 85° F., and of superheating the steam 150° F.

The broad principle consists in the use of a vertical "gas" (powdered coal) jet inlet, so constructed that an

FIG. 8.—SECTIONAL ELEVATION AND CROSS SECTION OF BETTINGTON BOILER, SHOWING PATH OF GASES.

Turbine Development in the U.S.—Our contemporary *Power*, in its review of the year, refers to the increasing size of American steam turbine units. Several machines of 30,000 kw. capacity are in service, as is also the 35,000-kw. unit of the Philadelphia Electric Co.; a 40,000 k.v.a. machine has been ordered by the Duquesne Light Co., of Pittsburg; the Detroit Edison Co. is contemplating 45,000 kw. units at a new station to be added to the Delray group; and rumour has it that a 50,000-kw. unit is soon to be built. In connection with large turbine units a two-stage condenser has been proposed, in which part of the steam is to be condensed in the first stage at a vacuum of, say, 29 in., the balance of the steam passing through the final stage of the turbine to the second stage of the condenser under a vacuum of 29½ in. An appreciable gain is expected over the standard condenser, and extremely high vacuums are possible without undue increase in area of the final stages of the turbine.

Australian Patents Board.—The Commonwealth Minister for Public Instruction recently caused the appointment of a Patents Investigation Board, to enable persons who had made inventions likely to be of use to the public, to have the merit of such inventions demonstrated or investigated without cost to themselves. If, after investigation, it is shown that an invention possesses novelty and merit, and is likely to be of assistance to industry, the general Board will consider it, and if favourable, will recommend the Government to assist the inventor in developing and perfecting it, and experimenting with it.—*Sydney Morning Herald*.

An Inquiry from Lyons.—H.M. Consul at Lyons reports that a dealer in accessories of all kinds for electric lighting, who has considerable orders which cannot be satisfied owing to shortage of local supplies, desires to get into communication with United Kingdom manufacturers of such accessories. (Reference No. 22.) Apply to the Board of Trade Commercial Intelligence Branch, London

umbrella-shaped flame is produced within a closed ring of vertical water-tubes, which form the main heating surface of the steam-producing plant. Fig. 8 shows a sectional elevation and cross-section of the Bettington boiler.

The coal is powdered by two pulverisers, situated directly in front of the boiler, one being driven by an A.C. motor and the other by a D.C. motor. These pulverisers also act as blowers—and it has been found that one pulveriser is quite sufficient to supply fuel up to the normal output of the boiler. The air supply to the pulveriser is pre-heated by the escaping flue-gases, and by this means

FIG. 9.—BETTINGTON BOILER IN COURSE OF ERECTION.

coal of 15 per cent. moisture is handled satisfactorily. From the pulveriser the coal passes to a separator, the larger and heavier particles returning to the pulveriser and the finer fuel passing direct to the tuyere, which is surrounded by a water jacket, and forms a mud drum.

The tubes surrounding the combustion chamber are lined with refractory material to within a short distance of the bottom header. No fireclay is used in lining this chamber, the fire-bricks being merely stacked in position. The ash of the fuel in its passage through the zone of highest temperature is converted into liquid spray, which quickly fills up the interstices, and the surplus, in time, trickles down to the bottom edge, from which it drips, in small globules, to the ash-pit below. The result is that the furnace keeps itself quite clear of slag at all rates of combustion, and deposits slag in a manageable form—i.e., in globules about $\frac{1}{2}$ in. in diameter, in the ash-pit.

The heating up and continuous ignition of the incoming stream of dust and air, is effected primarily by the enveloping sheath of the products of combustion—a mixture of gases (CO_2 , H_2O , and N principally), at a temperature of about $3,000^\circ\text{F}$.

This "self-igniter" does not change in position more than 10 per cent., no matter how great a velocity is given to the incoming coarse "gas" (coal dust).

Ignition is independent of the incandescent brickwork, which is, in its turn, dependent upon its proximity to the place of combustion for incandescence. The returning gases always ensure incandescent brickwork round the

tuyere, and, after a temporary stop, the fire may be re-started by turning on the fuel supply.

The boiler is fired up when cold by means of a Bunsen coal gas jet, which passes through the tuyere. (This gas supply comes from the neighbouring gasworks.) The pulveriser is run with the damper closed until a rich mixing is available, and then the full mixture is turned on. When this coarse "gas" is ignited, the Bunsen flame is turned off, and the fuel and air supply regulated.

It is possible to put this boiler on the range within 25 minutes of lighting up from dead cold—and this is a distinct advantage in a station of low load factor such as Johannesburg. As all the fuel is consumed in suspension, it follows that as soon as the fuel is shut off, the fire is extinguished like a gas jet, and there are practically no stand-by losses.

By means of a CO_2 recorder, or even by observing the colour of the flame, it is possible to regulate the proper supply of air and fuel to obtain absolutely smokeless combustion.

Anthracite coal, of course, is not suitable for burning in this boiler; when pulverised very finely, it burns fairly well, but not so well as coal having a higher percentage of volatile matter.

The boiler is equipped with a superheater, the tubes of which pass round the outside of the lower portion of the water tubes which form the combustion chamber.

The gases pass from the boiler into the feed section (which consists of two steel headers, stayed with expanded steel tubes, together with the necessary feed connections, and brick housing), and from there through the air heater away to the stack.

Fig. 9 shows the Bettington boiler in course of erection, the vertical water tubes and the superheater tubes being visible. The economiser is shown at the rear, and the motor-driven pulverisers and separators in the foreground. (Since the photograph was taken the existing boiler house has been extended to cover in the Bettington boiler.)

Notwithstanding the extra cost of pulverising, &c., it would seem that this boiler is not less efficient than the best known makes of water-tube boiler. It was supplied by Messrs. Fraser & Chalmers, Ltd., to whom the writer's thanks are due for the diagram in fig. 8, and for the figures of the steaming capacity.

Referring again to the Babcock boiler plant, not all

FIG. 10.—DOORNFONTEIN TRANSFORMER STATION.

these boilers are furnished with economisers, only seven economisers in all being installed, apart from the two mentioned. These are of the well-known "Green" make, and each has motor-driven scrapers as usual.

All the make-up water for the boiler feed is derived from the town mains, and is treated by the addition of four gallons of "Noxall" fluid in 24 hours. There is a

small de-oiling tank for electrically treating the condensate before it returns to the feed tanks. The feed pumps are all rotary pumps, partly turbine-driven and partly motor-driven.

An overhead coal bunker extends above the boilers for the whole length of the boiler house, with bucket elevator and conveyor, drawing coal from a sunk hopper, into which the coal is tipped from railway wagons.

An ash tunnel runs underneath the boiler house, along which small skips take the ashes to an end hopper, from which they are elevated to a silo, raised sufficiently above ground to enable carts to draw under. All ashes are removed from the site by the Sanitary Department of the Municipality. The coal and ash-handling plant and the bunkers were installed by Messrs. Reunert & Lenz, Ltd., of Johannesburg.

There are altogether eight stacks, five with the Prat induced-draught system, with two boilers to each stack. The marine type boiler has a stack to itself, as before

FIG. 11.—LINK CHAMBER, DOORNFONTEIN SUB-STATION.

explained. The Bettington boiler has its own stack with induced draught, and there is a further natural draught stack which accounts for three boilers.

It is, of necessity, a difficult matter to describe a boiler plant, which had originally no design—but which has been added to, from time to time, as the necessity arose. This, as previously pointed out, has been a difficulty with which the Department has had to deal from the beginning—and it is no small achievement to have carried out the work without serious interruption.

With reference to the outer area distribution, fig. 10 shows the subterranean transformer sub-station at Doornfontein. There are actually two chambers here, one containing the transformers and H.T. switchgear (fig. 10), and the other the low-tension distributing board (fig. 11). In fig. 11 the plus and minus signs painted on the bus-bar strips are misleading, the supply being, of course, alternating current, single-phase, at 200 volts.

Similar sub-stations and underground link chambers are in operation at Braamfontein and other important suburban centres, and it may be stated that some 60 townships, apart from the inner area, are at present supplied from the power station. New connections to the mains average about 100 per month.

(To be continued.)

CONTROL EQUIPMENTS FOR MACHINE TOOLS.

It has long been recognised by manufacturers and users that to operate a machine tool at its highest efficiency there should be possible a wide variation in speed in each individual tool. When tools are driven from long lines of shafting, this is not economically possible, but when tools are individually driven by electric motors they may be operated at any speeds independent of any other tool in the works.

To obtain the maximum efficiency, therefore, it is not only necessary to adopt individual motor drive for the machine tool, but the control of the driving motor must be simple, free from complication, and enable the operator to obtain the maximum output with the minimum risk.

The motor control should be entirely automatic, requiring no attention from the operator beyond pressing the control button or throwing over the control arm and enabling him to devote his whole attention to the work in hand. The automatic control should ensure that the motor starts, reverses, or stops in the shortest safe time when required, and that it is protected against excessive overloads at all times.

The following control equipments have been developed to meet the above requirements; they are classified under four headings as follows:—

- (a) Non-reversing control without dynamic braking.
- (b) Reversing control without dynamic braking.
- (c) Non-reversing control with dynamic braking.
- (d) Reversing control with dynamic braking.

The apparatus comprising the complete equipment is determined to an extent by the conditions of service, but all equipments have a common feature in the accelerating unit, which is an automatic device giving full protection to the motor, and ensuring that the machine starts or stops in the shortest safe time.

All these equipments are for constant speed machines, but they can be used for variable speed machines in conjunction with a field rheostat and a relay.

Standard equipments are designed for capacities up to 10 H.P. and for voltages up to 550. Non-reversing control equipments without dynamic braking can also be supplied up to 15 H.P. at 200/250 volts, and up to 25 H.P. at 400/550 volts.

The operation of the equipment is as follows:—When the control switch is closed, current flows through the motor armature, which is then in series with the full starting resistance and the first coil of the series contactor or accelerator, and the motor starts up slowly.

As the speed increases, the current taken from the line decreases, and when it reaches the value for which the

FIG. 1.—CONTROLLER FOR B.T.H. MACHINE TOOL CONTROL.

accelerator is set the first contactor closes and cuts out a section of the starting resistance. This results in a fresh current increment, and the operation is repeated by each contactor until the whole of the starting resistance is cut out and the motor is connected to the line.

The accelerator is designed so that each section of the resistance is cut out in the shortest safe time, while the motor current is kept within safe limits.

Each contactor switch is automatically locked open so long

Electrically-controlled Change-Speed Gear for Motor Vehicles.—We hear that considerable interest is just now being shown in motor manufacturing circles in a new electrically-controlled system of change speed gear for motor vehicles in which electro-magnetic clutches play an important part. The arrangement has been submitted to the most exhaustive tests, with the result that one of the largest motor manufacturing concerns in the country is reported to have decided to adopt it on all its new cars when once again it is in a position to revert to the manufacture of cars for the public, the factory being at present entirely engaged on Government work.

as the current flowing through its coil exceeds the value for which it is set. The motor is thus protected against excess current at each step of the accelerator.

On moving the control switch to the "off" position, the motor is disconnected from the line, and consequently comes to rest.

Where a quick stop is required, this is accomplished by means of a controller arranged for dynamic braking. When the handle of this controller is moved to the "braking" position the connections are changed, so that all the starting resistance is connected in series with the motor armature. The motor is then quickly brought to rest by dynamic braking, the contactor switches in this case acting as a retarding device and cutting out the resistance step by step as the speed of the motor decreases.

The accelerating unit consists of a number of series contactors, or electrically-operated switches, mounted on a slate

FIG. 2.—PUSH-BUTTON SWITCH FOR B.T.H. MACHINE TOOL CONTROL.

base, behind which the starting resistance is mounted, the whole unit being totally enclosed in an iron box suitable for attaching to a wall.

Each contactor when closed short-circuits a section of the starting resistance, so that when all the contactors are closed, the motor is connected direct to the line.

The special feature of these contactors is that they remain open if the current passing through the series-operating coil exceeds a pre-determined value, and close immediately the current decreases to that value.

The first contactor coil is connected in series with the starting resistance, so that on closing the control switch the current passes through this contactor coil. As the motor accelerates the current decreases until it reaches the pre-determined value at which the contactor is set to operate. The first contactor switch immediately closes and short-circuits the first section of the starting resistance, at the same time completing the circuit through the second contactor coil. This short-circuiting of the starting resistance causes an instantaneous current increase, which locks the second con-

FIG. 3.—MAIN SWITCH FUSE FOR B.T.H. MACHINE TOOL CONTROL.

tactor in the open position until the current again decreases to the pre-determined value due to the speeding up of the motor. Each section of the starting resistance is short-circuited in a similar manner.

The whole device is extremely simple, due to the fact that the coil used for closing the contactor is also used to hold it open until the current has decreased to a safe value. The coil, being a series coil, is wound with wire or strip of ample section so that it is not likely to be damaged by the instantaneous current surges.

The controllers supplied for these equipments are three-way switches built in the form of drum type controllers, and are supplied for reversing or non-reversing.

The controllers supplied for non-reversing control equipments, as well as those for reversing control equipments, are fitted with crank handles which can be moved to any of three stops. In the case of the former for forward running

or for braking positions, and in the case of reversing controllers with dynamic braking, these stops correspond to forward running, braking, and reverse running positions. For those without dynamic braking, the stops correspond to forward running, off and reverse running positions.

Controllers are fitted with magnetic blow-out coils, and are suitable for breaking the main current.

The main switch fuse is of the double-pole quick-break type, enclosed in a cast-iron case.

FIG. 4.—ACCELERATING UNIT FOR B.T.H. MACHINE TOOL CONTROL (cover removed).

Equipments without dynamic braking can be supplied with push-button control, in which case the connections are specially arranged, so that the result obtained on pressing any one button is maintained after releasing the button, and continues until a separate button is pressed.

The construction of this control switch is shown in the illustration. The contacts are mounted on a slate base and enclosed by a metal case, through which the push buttons project.

When variable speed control is required, the foregoing equipments must be supplemented by a hand-operated field rheostat and a field relay to prevent the motor being started with a weak field.

The relay supplied for this extra equipment permits the motor to be stopped and then started again without the risk of starting on a weak field and without the operator having to pay attention to the position of the rheostat handle. Thus, when the field rheostat has been set for a certain cutting speed, the motor will automatically run up to that cutting speed when restarted after a stoppage.

The control equipment described above is supplied by the British Thomson-Houston Co., Ltd., of Rugby, and is giving satisfactory service, not only in their own, but in many other works throughout the world.

THE DESIGN OF HIGH-PRESSURE DISTRIBUTION SYSTEMS.

Mr. J. R. BEARD'S paper was discussed at a meeting of the YORKSHIRE LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS, on January 12th, at Leeds.

The CHAIRMAN, Mr. H. H. WRIGHT, said that in many Yorkshire industrial districts the demand for power had grown at such a rate during the past few years that the station engineer had found some difficulty in keeping pace with it, the consequence being that many of the feeders were already overloaded; new feeders and transformer stations had had to be put down, and many questions had arisen similar to those dealt with in the paper. He thought the author erred on the side of safety in giving 24 years as the period of depreciation for underground cables. The committee appointed by the INSTITUTION last year to investigate this question had come to the conclusion that a life of 30 years should be allowed for all classes of underground cables if laid with proper regard to the nature of the soil, and suggested 60 years as the life of conduits. In the lay-out of a distribution system it was not the first cost of switchgear that was so important as the fact that by the choice of suitable discriminating gear a saving of many times the cost of the gear might be made in mains, etc. The author made out a very strong case for core balancing and split-conductor systems of protection, but there were many existing systems to which they could not be applied.

Mr. J. E. STONN said he believed that distribution of power to the consumer's terminals for transformation on the site was undoubtedly the method by which they would have to

transmit their larger loads in the future. He thought the general utility of the high-pressure transmission would be enhanced if the gear could be standardised on a pressure of 11,000 volts. The overhead system was undoubtedly the method by which the early development of an undertaking, which had a large area to cover, could be dealt with. He thought that pressures were bound to increase rather than remain stationary, but feared that the splitting-up of a 20,000-volt main to make it economical between sub-stations at such a high voltage would mean more than the number of switches allowed for intermediate sub-stations.

Mr. W. LANG thought that all practice showed that the survey of the route and the estimate of the probable demands that would be made for electrical power on that route were often very far short of what actually took place during a very short period. This had been instanced very especially during the war period; loads had come on to the mains that were never anticipated by the most sanguine of them. The value of the scrap copper of underground cables would, he thought, be more than that of the overhead lines.

Mr. A. R. CHAYTOR said he thought the best reason for the general neglect of the formula was given by fig. 4, which showed that for quite a considerable portion of the curve the annual cost was practically the same. It was hardly worth while, unless it was a very big undertaking, to work out the formula. He thought the scrap value after 17½ years of overhead lines would be nearer 10 per cent. than 20 per cent. With regard to underground mains and the 22½ years, he would give a 20 per cent. value and think the mains had 20 per cent. of their life left. It was usually forgotten that it was possible to take underground cables across fields for considerable distances; people compared the cost of overhead lines with underground cables to the disadvantage of the latter, from the fact that they were usually laid through the busy portions of towns and had to bear the cost of reinstatement of pavement.

Mr. J. SHEPHERD said he did not think the author gave full value to the overhead system; in England they did not use that system to anything like the extent that they did in other countries. At Zurich they had actually put up overhead lines for a distance of something like 80 miles. The same system was shortly to be introduced in Berlin. All the inner stations in Berlin were being shut down, and the entire power, which would certainly run to 500,000 kw., would be transmitted by the overhead system a matter of something like 90 or 100 miles. If they could do that abroad he thought the time would come when, in England, they would have to adopt the overhead system for higher voltages. The Treasury usually allowed 25 years for the life of a cable, but he did not see, if cables were laid solid where no surface wear came into contact with the lead, why they should not last 100 years. A good deal had been said about the calculation of the economical area, but if the data were incorrect all the calculations would be inaccurate. In getting out this economical area he did not think the author had made any allowance for the capital value of the plant required to compensate for the losses in the cable.

Mr. WILSON HARTNELL said that no engineer in his senses would put down an underground wire if he could put the wire above ground. In most of the British Colonies, wherever public opinion was not against it, all the wires were put above ground. The Yorkshire Power Co. was carrying its wires where it could, but what he thought was needed was some very drastic legislation to empower the company to carry the wires over any land, irrespective of what the owners of the property thought of the matter.

Mr. J. H. SHAW said he desired to say a good word for the "change-over fee" system. In the undertaking with which he was connected it had been in operation for 10 years, and he believed they had only had six faults on some 60 miles of extra-high-tension mains. The author discussed the diversity factor as helping the interconnected system; that might be all right for the North-East Coast, but in towns where the trades were similar and started more or less at the same time, and left off at the same time, there was no diversity factor.

The AUTHOR, in the course of his reply, said the 22½ years for cables was not intended to be taken as an actual figure; it simply worked out at that owing to his taking 2 per cent. He was very glad that his capital charges had been criticised as being on the high side. He still felt, however, that the figure was somewhere about what it should be, and it did not really conflict with the Local Government Board's revised figures so much as appeared. He agreed that the life of cables was probably very much more than 22½ years, and in the Newcastle district in very few cases had any serious depreciation of cables been found; many of them had been in since 1901, and some which were put in then were as sound to-day as ever. Core balancing was not mentioned in the paper, but his people had used quite a lot of so-called core-balancing protection on single-ended feeders and on rotary-converter transformers, where it was very useful in giving an instantaneous trip on faults. He rather doubted whether one could usefully standardise voltages at present; what should be standardised was the frequency. His firm were putting up large mileages of overhead lines at present; there was no doubt, however, that in the North-East Coast district, if one talked to the operation people they would ask for cables every time. There were many ways in which overhead lines could be damaged, quite apart from questions of design; for example, they could not do away with hay blowing off a haystack. The overhead lines were found to be useful in the early

stages of development. Recently his firm had connected up a very big amount of munition load, and, in all cases, it had been so easy to do it that the supply had been available months before the firms had been ready to take it, although, in many cases, they were seven or eight miles from the company's power stations. The split-conductor for use on existing cables by running them in duplicate had been developed, and was now in quite successful operation. He believed his firm found that 2½ switches per sub-station was quite a reasonable figure. In the majority of sub-stations they only required two. He could not agree that the old rule-of-thumb was all right, but it was rather a surprise to him, in going through these calculations, to find that the densities came down to about the old figure of 1,000 amps. per sq. in. They had taken underground cables in many instances across fields, and, as a rule, it was more difficult to arrange for overhead lines. In open agricultural country the cables would have to be laid deeper than they had to be in the roads. He believed in Berlin they were experimenting with something like 60,000-volt underground cables. When he said that there were twice as many faults in overhead lines as in cables, they must not conclude that there was a great number of faults on the former. It simply meant that there were very few faults in the cables, and the number of faults they got on the overhead lines was quite sufficient to annoy consumers and, hence, generally forbade their use. Inductance in feeders had the disadvantage of tending to limit the area of distribution, and it should be avoided. The Americans, who strongly recommended inductance in feeders, were the people who had done nothing to develop switch design for about ten years. They brought out, ten years ago, a switchgear which was better than they had in England, but he did not think that that position of affairs obtained now. Rotary condensers had been used in two cases in Durham, with very satisfactory results. He quite agreed that one could do too much calculation in designing actual extensions. He had allowed for the capital value of the plant to supply the losses. In America water-power transmission had forced them into the use of very high voltages, and his eyes had been very much opened by some figures he had seen in an American paper with regard to the number of breakdowns on overhead lines on a large system. The figures were half-a-dozen times as great as one would expect on an English system. One thing which explained the use of overload lines in America was that there they did not mind a temporary interruption so much as did English people. Electrical people in America had got a free field, and if consumers did not want their supply they need not have it. In England, however, circumstances were entirely opposite. Here electricity competed all the time against other forms of power and lighting. On the North-East Coast it was almost invariably possible to couple up consumers on the interconnected system without any consideration whatever for the effect it would have on the protective arrangements of the rest of the system. On the North-East Coast they had very varied industries, and the industries themselves had very variable loads, and it was not a question of starting up a big block of machinery at a certain time and shutting it down at another time. The cost of the protective devices, he thought, could be readily explained by the fact that they had, up to the present, been used on very large systems, and the corresponding switchgear had been developed to suit these systems, and that was very expensive. If there was a demand for say, the split-conductor system on lighter forms of gear, it should be readily designed to suit requirements.

ELECTRICAL ENGINEERS AND THE MOTOR CAR TRADE.

A QUESTION of some importance to electrical engineers was discussed at the meeting of the Agents' Section, Ltd., and the Motor Trade Association, which has just been held at Leeds. It may be mentioned that the first-named body is the Agents' Branch of the Society of Motor Manufacturers and Traders, while the M.T.A., as it is usually known, is an association of motor traders whose object is that of preventing, as far as possible, other than recognised and legitimate motor traders from securing trade terms, and of preventing price-cutting in manufacturers' standard productions. The main point under discussion was whether electrical engineers were entitled to trade terms on motor goods.

The opening speaker was Mr. G. HUBERT WOODS, of the British Westinghouse Co., Ltd., who stated that, as regards his company, the matter of electricians was a difficult one. The difficulty arose from the fact that they had a large number of electrical customers all over the country who were entitled to trade terms on electrical parts. Therefore, if trade terms were given to a firm on a dynamo which was going to be put on the floor, the question was naturally asked why trade terms should not also be given on a dynamo which was going to be put on a motor car. It was difficult for a manufacturing company to say, "unless you are selling motor cars, we cannot give you trade terms." He thought electrical motors would be very prevalent in the future, and he considered the right thing for both bodies was to legislate

for a condition of things which could be seen coming, before it came. It would not necessarily be assumed that because electrical firms were admitted to membership of the Motor Trade Association, they were entitled to the same terms as motor agents. Manufacturers could give them a discount of some sort or other, but continue to give to the members of the motor trade the same discount as at present. Mr. Woods concluded by stating that if it would help matters along, he would propose that a class for electrical engineers be formed by the Motor Trade Association, and that they be admitted under that category provided their applications were proposed by the local division of the Association.

Mr. A. GOODWIN, of Messrs. C. A. Vandervell & Co., Ltd., said that he did not agree with Mr. Woods' remarks as to it being difficult to define the difference between trade in a dynamo that was to be fixed on a floor and one that was to be affixed to a car. In his opinion, the line of demarcation was one of definite character. When a firm received an application for trade terms from electrical people, there was generally something which cropped up in the correspondence, or on the notepaper of the firm applying for trade terms that would give some clue as to the class of business the firm in question were doing. As regards his company, if the notepaper did not give any indication, their travellers on the spot made certain inquiries. In the case of lamp bulbs, however, it was impossible to refuse to supply them at full trade terms to any electrical firm in the trade, and, therefore, in his opinion, Mr. Woods' suggestion that the manufacturers should give electrical firms one class of terms and the legitimate motor trader another was one that could scarcely be followed in practice, although very nice in theory. The point was to give the manufacturer some basis to work upon, but he did not think the organisation could move in the matter as to where the line of demarcation should be drawn.

Mr. A. NOEL MOBS, of the Pychley Autocar Co., Ltd., of Northampton, expressed the opinion that electrical firms should not be included in the M.T.A. It was, however, going too far to say that nobody but motor firms legitimately in the motor trade should be supplied with accessories in the electrical line which were fixed on motor cars at any discount whatever. If a few lamp bulbs were sold by electrical firms and used on motor cars, surely they could stand that. He thought the Association should go for simplicity, and that it would be sufficient to say that electrical firms should have trade terms on proper electrical goods without bringing them into the Association. He would propose a resolution to that effect.

In closing the discussion, the Chairman, Mr. A. R. ATKREY, of Nottingham, said that it was no use trying to close one's eyes to the fact that the *bona-fide* electrical engineer was not only entitled to trade terms on electrical goods, but was looming on the horizon as one of the most important factors in connection with the motor industry, and if a deaf ear were turned to their application to join the Association, the time might come when the Association might feel sorry, and electrical firms might decline to carry out the interests of the trade. The ideal of the Association was not to prevent anybody earning a legitimate livelihood, but to embrace in the ranks and cover by its influence all those who could help in the general advance of the movement. The question the meeting had to decide was as to whether they would admit electrical engineering firms to a section, or whether they would close the Association against them and leave them outside and uncontrolled.

Eventually the following resolution was adopted:—"That in the opinion of this meeting electrical engineers shall be entitled to trade terms on electrical goods, but shall not be entitled to membership of the Agents' Section, Ltd., or the Motor Trade Association, or to trade terms on motor cars or accessories other than electrical, and that price maintenance agreements must be obtained from them."

Commenting on the meeting, the *Motor Trader*, to whom we are indebted for our summary of the proceedings, concludes:—"On the whole, the resolution, though in the nature of a *via media*, provides an acceptable solution of the problem. Electrical engineers may have no more than an academic interest in the motor trade, but to suggest that the manufacturers of electrical goods should recognise the distinction between motor and non-motor goods in supplying them would be imposing an almost impossible obligation. It is desirable, however, that eligibility for trade terms in one class of motor goods should not carry with it a similar privilege in regard to all motor goods."

ELECTRIC GENERATING STATIONS IN CHINA.

By PROF. C. A. MIDDLETON SMITH, M.Sc., A.M.I.E.E.

(Abstract of paper read before the Hong-Kong Local Centre of the Institution of Electrical Engineers.)

CHINA is a country which, for practical purposes, is entirely devoid of roads. It is quite probable that 90 per cent. of the inhabitants of China have never heard of a steam engine, or of a heat engine of any description. The number of Chinese who have any idea of what is meant by the words "electrical

power station" cannot be one-tenth of one per cent. of the population. Possibly about 10 per cent. of the people have seen the ordinary electric lamp, and about one-tenth of that number have seen a gas lamp.

In the whole of China there are only three places in which modern industrialism is even attempted on any scale such as is common in towns of, say, 50,000 inhabitants in England. These places are Hong-Kong (a British colony), Shanghai (a foreign settlement), and Hankow. In these places the work of the electrical engineer is very much in evidence.

The Hong-Kong dockyards probably employ about 600 Europeans and about 7,000 Chinese workmen.

The three dockyards are well equipped with all modern machine tools, many of which are motor-driven. In the Taikoo Dockyard there is a large central power station containing 1,000 B.H.P. gas engines and continuous-current generators with a total capacity of 2,250 kw. Most gas producers supply the fuel for the engines. In the Naval Dockyard there is a central station with steam and Diesel engines.

In the colony of Hong-Kong there are two public electricity supply companies. That which is on the island and supplies the city of Victoria has a station containing 2,000 kw. of Diesel engines and 600 kw. of steam engines, and a new steam turbine-driven station is being planned. The present price of electrical energy as supplied by this company is 6d. per unit for lighting and 1½d. and 1½d. for power. There is also a separate generating station for supplying power to the trams. This is steam-driven, and probably will disappear in time. The Hong-Kong University has its own central station, installed largely for educational work, with a total capacity of rather over 100 h.p. of gas, oil, and steam engines, a steam turbine, and a Pelton wheel.

In Kowloon, on the mainland portion of the colony of Hong-Kong, the China Light & Power Co. supply light and power. Their plant is rated at 516 kw., but 1,500 kw. is to be installed this year.

Near Hong-Kong there is the Canton Electric Supply Co. Canton is the most populous and progressive city in China. There are well over a million inhabitants. The Canton Supply Co. uses steam and Diesel engines—it was originally a steam-engine station—and its total capacity is 1,540 kw. The Chinese shopkeeper is willing to pay high prices for electric light, and uses it in a most lavish fashion.

The great centre of electrical development in China is Shanghai. The conditions are more favourable in Shanghai than in any other place in the Far East for such enterprise, but at the same time many opportunities have been seized there which might easily have been lost.

The Shanghai generating station compares most favourably with anything of its kind in Europe or America. It is, indeed, a model for the Far East, and British engineers should be very proud of the fact that it has been built up under the direct personal supervision of a Britisher.*

The station is steam-driven with two 5,000-kw. and two 2,000-kw. turbines. Quite recently the chief engineer has suggested extensions which amount to 20,000 kw. It is almost certain that this region will be the first part of China to develop works and factories on a large scale.

An English firm have installed 102 steam engines in China, with a total rating of 28,960 B.H.P. Most of these are used for electricity supply.

Another British firm have installed in North China at Soochow a 375-kw. 3-phase alternator, direct-coupled to a high-speed steam engine, complete with high-tension switchboard, etc.

In Chang Chow there is a 150-kw. 3-phase alternator direct-coupled to a high-speed steam engine complete with water-tube boilers, high-tension switchboard, transformers, etc.

In Tientsin there are two 75-kw. continuous-current generators coupled to high-speed steam engines, supplied for extension lighting of the Japanese settlement. Further contracts recently secured are for the lighting of two other large Chinese cities; the electrical plant consists of one 200-kw. and one 150-kw. 3-phase alternator. A large number of single-phase and 3-phase motors from 5 up to 100 h.p. have also been supplied for use in cotton mills and other factories. An outlet for electrical plant is found in up-country hospitals, missions, and private Chinese residences where small dynamos driven by oil engines are very much in favour. Many small steam engines and dynamos for lighting river steamers have been sent to South China, as well as small oil-driven sets for hotels and private houses.

A merchant firm state that they have supplied various electric lighting installations in South China, including a large number of small private plants from 1 kw. to 10 kw.; also one 12-kw. 100-volt continuous-current set direct-coupled to a vertical semi-Diesel engine at Tung Shan, Canton. A large European firm have supplied important plants in the South.

In the case of the new installations the general practice at present seems to show that the Chinese commence on a scale of rather under 100 kw. Take a small oil-engine installation of 50 kw. The capital cost of the engines, foundations, dynamos, and switchboard would be (roughly) £13,000 (£1,300). A rough building and land would probably bring it up to \$15,000 (£1,500).

We find at the University that crude oil can be used as fuel to cost less than 2½ cents (½d.) per unit; lubricating oil, and

* A full description of this station appeared in the *Elec. Rev.* of November 5th, 12th and 19th, 1915.

waste, etc., say $\frac{1}{4}$ cent (1d.) per unit. Wages for supervision, drivers, etc., \$200 (£20) a month, say \$2,400 (£240) per annum. The output of the station is reckoned at 50,000 units per annum. The total generating costs are about 11 cents. (2½d.) per unit. As overhead mains may be used, the distribution costs are low. Experience has shown that the Chinese will pay 25 cents (6½d.) a unit, and there is clearly a very good margin of profit.

There is practically no legislation in China concerning electric supply, and if progress continues as at present, there will be endless annoyance and confusion for engineers and customers in a few years.

After two years of study of the subject, the author has the impression that at present the demand for electrical apparatus in China is on a comparatively small scale. Shanghai is the one great exception.

There is a great desire among all classes of the Chinese to have electric light, and experience in and around Hong-Kong seems to prove that they are quite willing to pay for it at even extravagant prices.

The plants already installed are having an educational effect. In nearly all cases extensions are contemplated.

The Chinese are particularly anxious to make use of applied science. The simple statement that, of the 167 students in the Hong-Kong University, 92 have selected engineering as a profession, shows quite clearly the direction of the thoughts of the more progressive parents.

Up till the present there has been practically nothing in the nature of an educative campaign on behalf of electrical machinery in China. There are difficulties, financial and administrative, to be overcome before this market is greatly increased, but the greatest difficulty of all is to provide object lessons to the Chinese, and to supply information and unbiased advice. In the furtherance of that work the Engineering Department of the Hong-Kong University will be happy to do its utmost.

The large oil companies are busily extending their market all over China. Possibly the immediate developments inland will be brought about by the use of oil engines or water turbines. The use of coal inland is not probable in the immediate future. Even in South China it is necessary to use Japanese coal, and the price seems to be about \$10 (£1) per ton. The fuel problem is one that will be solved easily, when the Chinese begin properly to develop their own natural resources. The electrical engineer has to compete only with such crude illuminants as the candle and oil lamp.

In the discussion that followed, Mr. E. T. WILLIAMS said that without co-operation Great Britain could not hope to reap the possibilities of electrical work in a vast country like China. If this prospective market was to be really exploited, what was wanted was co-operation embracing the selling of machinery, the undertaking of contracts, and the devising and financing of electrical schemes; in other words, they must employ in China methods adapted to the circumstances of the country. The electrical and engineering firms of Great Britain should combine their resources for China, and then, having studied the possibilities, should distribute throughout the country a properly organised business network, largely composed of educated Chinese engineers under European control. This organisation should conduct in China the business of the united British interests. In time it would become a self-supporting organisation, and would create a great demand for the electrical manufactures of Great Britain.

Mr. D. W. MUXTON said that, assuming that a Chinese came down from the interior to purchase machinery, he was generally discovered by the various compradores, into whose clutches he fell; not one, but several estimates were submitted, and disastrous competition followed, the result of which was that, in order to be in the running, the very minimum of machinery was offered, together with a vaguely worded tender. When the contract was finally awarded, the firm in question generally began to consider what items not absolutely indispensable could be cut out. Unfortunately, contractors of repute there had to compete with firms who sold anything from tinnacks to aeroplanes; and some of these firms, having very little in the way of reputation to live up to, promised anything, and seldom fulfilled their promises.

Mr. W. L. CARTER said that it was not true that industrially the country was unorganised. China was the cradle of trade unionism, and the guilds had held complete control for many centuries. It was due to the great efficiency of these guilds that this people had resisted the introduction of modern methods into their ancient industries. Before any large schemes could come to fruition the whole question of security for both foreign and native capital would have to be satisfactorily settled.

Prof. T. H. MATTHEWMAN held that if electricity was to appeal to the majority of China's millions, it would be from the standpoint of its economy as compared with existing illuminants. This was the vital point in a country such as China, where the scale of living was so low. He bore out what the author said about the importance of the engineering graduate as a factor in the development of the electrical industry in China. The American manufacturer had realised the importance of training such graduates, who came back to China to represent these firms and push American goods. If British manufacturers would offer similar conditions, it would be greatly to their advantage in the future.

Mr. G. E. MARLEY emphasised the great need in Hong-Kong and China generally for the unbiased consulting engineer.

Prof. SMITH, in reply, agreed with Mr. Williams concerning co-operation, and mentioned that the British Electrical and Allied Manufacturers' Association had guaranteed the electrical equipment for the Hong-Kong University—a most excellent example of co-operation.

TRADE STATISTICS OF SPAIN.

THE figures given below show the imports of electrical and similar goods into Spain during the year 1914, according to the official statistics recently issued. It will be observed that in both years German trade predominated in practically every branch. The growing share of the United States is also noteworthy. The figures for 1913 are given for purposes of comparison, and notes of increases and decreases (which are very considerable) have been added:—

Manchuria.—According to *Eastern Engineering*, a company of Chinese and Russian capitalists has been organised under the name of "Energia" to undertake the construction of an electric street railway and power plant at Harbin. A joint stock company is proposed in which the municipality will take an interest if a proper franchise is granted.

BRITISH INDUSTRY AFTER THE WAR.

WHAT is to be the outcome of the exhaustive investigation that has been made by a sub-committee of the Advisory Committee to the Board of Trade on Commercial Intelligence? We wish that we could expect more than we really do by way of immediate result. The findings of the sub-committee, as adopted by the committee have been published—for our information. That is all that Mr. Runciman will or can say at the moment. The sub-committee was a small one (five members), and it only had to consider a few selected industries. These circumstances unfortunately open the way for delay, and that way the President and his Department elect to follow. Why? In the House of Commons a few weeks ago the President said that many of the recommendations were of wider scope than the group of industries investigated, and that "any decision thereon must involve considerations of policy affecting many other industries and interests." Mr. Runciman declined to take "responsibility for any of its conclusions," but he felt, nevertheless that, "pending the institution of wider inquiries," it was desirable "for the public to be made acquainted with the information so far obtained." How much better than a cold douche is this? Yet we cannot entirely blame the President for this attitude, for the committee itself says that "the conclusions at which we have arrived might be modified in some respects were the range of the inquiry to be extended." We find herein little encouragement to seriously accept Mr. Runciman's very confident declaration that when the war is over we shall have available means for effectively dealing with German industrial and trading competition, and preventing the enemy from ever again "lifting her head" commercially, but as the report is in many ways important we feel justified in devoting a good deal of space to the matter. We hope that the Government will hasten the holding of those "wider inquiries."

The sub-committee was appointed six months ago to report what steps should be taken to secure the position, after the war, of firms who have undertaken industries "in consequence of the Exchange meetings leading up to the British Industries Fair." This, in the opinion of the committee, restricted its inquiry to the following:—(1) Paper manufacture. (2) Printing trade. (3) Stationery trade. (4) Jewellers' and silversmiths' trade. (5) Cutlery. (6) Fancy leather. (7) Glassware. (8) China and earthenware. (9) Toys. (10) Electrical apparatus. (11) Brushes. (12) Hardware. And a subsequent one, introduced by the President himself (13) Magneto industry. As regards (12), as the Wholesale Hardware Club could not furnish evidence within the time allowed, that branch is not covered. If it had been we should have had the unlucky number, and the President's cold douche might have been a foregone conclusion instead of, as we regard it, an extremely unpleasant surprise. Many of the above classes of industry are really no concern of ours as an electrical trade

NOTICE.

IN view of the recent increase in the Postal Charges, our Subscription Rates for Great Britain and Canada will until further notice be increased to £1 1s. 8d. and £1 3s. 10d. respectively.

journal, but we must indicate them so that nobody imagines that this is an electrical report pure and simple. We may desire to know what definition the committee would give for "electrical apparatus." In this connection we have to turn to the Cheapside Exchange meeting, where all sorts of "small stuff," of which we have imported large quantities from Germany, etc., was brought together, and to the British Industries Fair, at the Agricultural Hall, where, speaking from memory, we did not see much of an electrical character. But though this report is not one on electrical trade pure and simple, we may derive satisfaction from the circumstance that the committee availed itself somewhat generously of the information and counsel vouchsafed by the British Electrical and Allied Manufacturers' Association, and we find that in several places "electrical machinery" is referred to, which seems hardly to have been intended by the instruction to cover "electrical apparatus." We remember that the secretary of the B.E.A.M.A. not long ago told us, in pretty much the same words as Mr. Runciman used in his bravest speech in the House of Commons, that when the war was finished everything would be found in readiness. The B.E.A.M.A. certainly seems to have tried hard to impress a number of wholesome truths upon the minds of the committee; indeed, we believe it has succeeded, but then there is sometimes a difference between the minds of business men and those of our politicians. Something must now be done to prevent the Association's efforts, and those of the committee, being filed away and forgotten. We may hope for much from the Mansion House, the Sheffield, and other important demonstrations intended to impress the Government with the necessity for strong and forceful action before it is again "too late"; we may look for the plain-speaking of the Colonies and the desires of our Allies to have effect upon the minds of the overburdened Mr. Runciman and his staff; but the important fact remains that, unless we keep at it, everything will be far from ready when the war ends. We cannot let everything wait while political parties resume their fiscal controversies. The President has himself stated that in the trade war there are some things that "cannot wait." This report, restricted though it be in scope, must not be doomed to lie deep in departmental dust, for its purpose will not be met if we are to consider it as merely useful for making "the public" "acquainted with the information" it contains. There is too much of the stereotyped official reply "your-letter-shall-receive-attention" about this utterance. We confess that we had hoped for something better. Whether or not the committee has exceeded the anticipated scope in its recommendations, there is unquestionably much in the report which, to our way of thinking, could be adopted forthwith "without involving considerations of policy affecting many other industries and interests" unless with benefit to those industries. But we must let the report speak for itself, so we are publishing a full abstract, together with its recommendations, in our other pages, and would urge upon the Government the necessity for taking immediate steps to carry into effect those reforms upon which practically everybody is agreed.

Rubber.

THE recent sharp ups and downs in the price of crude rubber have left the market for this commodity in a rather uncertain state, and its future course is therefore purely problematic, while to some extent subject to the progress of the demand especially on the part of big trans-Atlantic manufacturers. There is good reason for believing that the latter made full provision

for their near requirements some time ago when prices were still well under 3s. a lb., and although some considerable American buying was again experienced on the subsequent rapid rise on the way up to over 4s. for plantation rubber under the influence of the seriously threatening aspect of shipping, the demand from that quarter has been of a distinctly more parsimonious character. The fact is worth noting, however, that the recent steady fall in prices down to about 3s. per lb. has by no means paralysed the trade demand, which has indeed been proceeding on a fairly satisfactory scale. When the price was forced up to what was generally considered an artificially high level, within a period of comparative scarcity on the spot, quite a number of consumers kept out of the market, but the subsequent fall has given them an opportunity to cover their needs to a moderate extent. The price of the commodity is certainly quite high enough in the neighbourhood of 3s., but the market, nevertheless, shows wonderful resistance at that level in spite of the fact that the position on the spot has been eased considerably of late by very liberal arrivals which has resulted in a gradual increase of the warehouse stocks. There can no longer be any fear of a shortage, for indications are precisely the other way, while quite heavy quantities are afloat from the Eastern plantation districts. Eastern shipments are now being diverted *via* the Cape route for there is not much chance of further shipments through the Suez Canal for some time to come in view of the precarious state of shipping across the Suez Canal and the Mediterranean. The rubber coming *via* the Cape will probably be a longer time in transit, but there is reason for assuming that the delay thus incurred will not be quite so serious as was apprehended at first. The progress of consumption in allied and neutral countries within the last six months has certainly surpassed the most sanguine expectations, and it is pretty certain that this progress will not be materially impaired so long as the war lasts, provided prices are kept within reasonable bounds. It is well to bear in mind that production has been making substantial headway in the Eastern plantations. The belief is now in fact expressed that the further excess of the output for the current year will be considerably above original expectations. There is still a little uneasiness on that score in the trans-Atlantic trade, and this tends to explain the comparatively keener demand which is still being experienced for delivery within the next few months, for which a small premium is obtainable over the prices current on the spot.

The Eastbourne Switch-pillar Fatality.

ELSEWHERE in this issue, by the courtesy of the Board of Trade, we are enabled to publish a report which has been prepared by Mr. A. P. Trotter, electrical adviser to the Board, with regard to the fatal accident at Eastbourne on Boxing Day. It will be seen that the report makes certain recommendations, to some of which no exception can be taken. Obviously, for various reasons, it is desirable that the switch-pillars should be placed in side streets, and away from the edge of the footpath; this would have the advantage of avoiding obstruction to traffic, and generally, in the case of new work, there would be no difficulty and little expense in following this course. Clauses 6 to 8 also appear reasonable, but Clauses 3, 4, and 5 reflect that spirit which, before the war, could be discerned in so many official decrees, especially in connection with electrical undertakings of every description. We refer to the bureaucratic tendency continually to impose fresh burdens upon them, to add to the multitude of restrictions by which they are bound.

New regulations are constantly being drawn up with the object of saving life, an aim which commands the approval of every citizen; but there is a reasonable limit to all such precautions, and care should be taken that the want of a due sense of proportion does not lead to the perpetration of absurdities.

In this case, the first on record in which life has been lost due to the smashing of a switch-pillar, a result which,

Mr. Trotter says, could not have happened if the aggressor had been either a gig or a traction engine, but only when it was a motor-car, the immediate outcome has been the issue of a series of recommendations apparently based upon our military experience during the war: retreat beyond the reach of the enemy, throw up a first line of defence, 6 in. high x 20 ft. long, fortify the position with stone fenders or cast-iron spurs, fill the pillar with wire entanglements so as to ensure short circuits and dead earths, and so on—why all this panic? Men and women are dying in hundreds around us—in the metropolitan area alone on the average three persons are killed every day by vehicles, and nearly 80 are injured, but no suggestion is made to fit all vehicles with pneumatic buffers or to provide pedestrians with compulsory crinolines.

As in the case of so many legislative acts, the restrictions thus imposed may introduce other and new dangers. For example, if the Eastbourne switch-pillar had been fortified with a massive kerb, concrete pillars, &c., as suggested, it would not have given way—but the car would, and in all probability some of its occupants would have been killed. Or a person stepping off or upon the high kerbstone in the dark might stumble and crack his skull—many a man has lost his life by simpler means. The dangers of street-boxes containing high-pressure apparatus are well known. What is the use of trying to stop up mesh by mesh the sieve through which human life is always pouring by myriad paths? In our opinion, there is no need for any official action arising out of this unique accident.

German Electrical Companies After the War.

At the recent general meeting of the Siemens & Halske Co., held in Berlin, Dr. F. A. Spiecker stated, on behalf of the directors, that it was well to assume that the new financial year would remain under the influence of the conditions of war, although, perhaps, to a diminished extent. It was probably premature to form an opinion as to the period following the conclusion of peace, but, from the company's point of view, they believed that they could look forward to it with some confidence. The amount of their credit at the banks, and that of the Siemens-Schuckert Works, were now greater than were shown in the balance-sheets, and the companies, therefore, had at disposal such considerable funds that they were fully equal to all demands which could be made upon them, especially after the declaration of peace. Concerning the proposed efforts to establish a Government monopoly in the electricity industry, the speaker stated that no idea could be formed of the possible effects before they knew what the Empire or the individual States had in contemplation. The directors' only interest in the matter was for the supply of electric power in the whole of the country to develop. If the State assisted this development so that electric power was obtainable at low prices, the company's special interests as manufacturers would be assisted too. It would be otherwise, however, if the State's designs and measures were to exercise a paralysing effect. The speaker said that orders continued to arrive from neutral countries, although not to the same extent as prior to the war. At the general meeting of the Electricity Co. (late Schuckert) of Nuremberg, general manager von Petri remarked that not much could be said in regard to the company's foreign undertakings because very little information was available. The promotion of undertakings abroad had greatly suffered under the influence of the war, but the manufacturing activity of the Siemens-Schuckert Works had rapidly been accommodated to the situation. It had been found that business in undertakings outside of Germany was accompanied by enormous risks. The company, however, would not allow itself to be disconcerted in its policy in that direction, but would continue it after the war though a different course would be assumed in the selection of the countries and the objects of the undertakings, as a result of the experience gained during the war.

BRITISH TRADE AFTER THE WAR.

THE following is an abstract of the report of a sub-committee of the Advisory Committee to the Board of Trade on Commercial Intelligence with respect to measures for securing the position, after the war, of certain branches of British industry. Those branches are detailed in our leader columns to-day, where we comment upon the report.

The Committee first asked a number of representative firms and trade associations interested in the particular branches referred to, to make observations on the general question and in regard to certain possible lines of Government action which had been suggested to it. Subsequently some of those who submitted memoranda appeared before the Committee. An attempt was made to form an estimate of the value of the imports into this country under normal conditions, of goods of the kinds covered by the inquiry, and of the extent to which they are imported from enemy sources. Exact data were not available in several cases, but a table, from which we make the following extracts, shows approximately for each branch of trade the value of the imports from all sources in 1913, and the value of the imports from enemy countries, with, in the last column, some remarks as to the other sources of supply.

Item.	Value of total imports in 1913.	Value of imports in 1913 from Germany, Austria-Hungary, and the Balkans.	Remarks.	
Glassware: Fine and manufactured glass, flat and (except bottles)	1,885,000	636,000	183,000	The principal source of supply, other than Germany, is Belgium.
Bottles	815,000	422,000	4,000	The principal source of supply, other than Germany, is France. The exports of United Kingdom manufacture under this head were valued at £606,000, of which £430,000 to British Possessions, and £186,000 to foreign countries. The chief source of supply is France. The exports of United Kingdom manufacture were valued at £213,000, of which £62,000 to British Possessions, and £151,000 to foreign countries.
China and earthenware: Porcelain, china ware and paraf.	219,000	53,000	—	The exports of United Kingdom manufacture were valued at £213,000, of which £62,000 to British Possessions, and £151,000 to foreign countries.
Electrical ware, goods, fittings and chemical ware.	54,000	50,000	1,000	
Other earthenware including semi-porcelain and majolica.	716,000	617,000	4,000	The exports of United Kingdom manufacture were valued at £1,917,000, of which £989,000 to British Possessions, and £928,000 to foreign countries.
Goods and electrical apparatus (other than machinery and insulated wires): Telegraph and telephone apparatus.	252,000	39,000	—	The imports are chiefly from Belgium and Sweden. The exports of United Kingdom manufacture under this head were valued at £230,000, of which £135,000 to British Possessions, and £165,000 to foreign countries.
Electric glow lamps.	196,000	156,000	6,000	
Parts of electric lamps.	115,000	97,000	—	
Unenumerated	254,000	112,000	—	The remaining imports are chiefly from the U.S.A. The exports of United Kingdom manufacture under this head were valued at £1,063,000, of which £494,000 to British Possessions, and £569,000 to foreign countries. There is a large importation from the U.S.A.
Electrical machinery.	1,316,000	721,000	—	The exports of United Kingdom manufacture under this head were valued at £2,239,000, of which £1,463,000 to British Possessions, and £1,216,000 to foreign countries.
Magnetos (including A.C.)	500,000	475,000	—	

The value of the imports into the United Kingdom, of goods of the kinds included within the scope of the inquiry may be taken as approximately £16,000,000, and of this total nearly £7,700,000 represented goods of German origin, and £500,000 goods of Austro-Hungarian origin. But it has to be remembered that there is also a large German and Austro-Hungarian export of these classes of goods into other parts of the British Dominions. In the absence of strictly comparable statistics, no absolutely definite figures can be given, but it is estimated that the total value of such goods imported into the five self-governing Dominions and India in 1913 cannot have been less than £3,000,000. Austro-Hungarian competition is noteworthy only in the case of jewellery and glassware. As regards German competition in the branches of trade under review, it is

to be observed that it is limited, as a rule, to certain special lines of goods and does not extend to the whole range of articles included in the class; and that in a number of cases the exports of United Kingdom manufactures included under the same general heading are larger than, or nearly as large as, the foreign imports. This is so as regards china and earthenware; telegraph and telephone apparatus; unenumerated electrical goods and apparatus; and electrical machinery.

The Committee proceeds to the consideration of the detailed representations as to the ways in which Government assistance might be given to the various branches of industry which have been under examination. We quote:—

Industrial Scientific Research.

"The value of scientific research in industry, and the desirability of Government assistance in the promotion thereof, was generally recognised both in the memoranda furnished to us and by the witnesses who appeared before us, though it was admitted that British manufacturers and workmen have not always shown themselves in the past sufficiently appreciative of the value of scientific investigation into industrial problems, or of technical training. In a number of cases reference was made to the valuable assistance given by technical institutions to German industry, and, though no very definite evidence on the point was adduced, we see no reason to doubt the validity of the opinions expressed. As regards the particular British industries with which we are now concerned, very valuable work is being done in respect of glass by the University of Sheffield and the Institute of Chemistry (by the latter body especially as regards chemical glassware and optical glass); in respect of hard porcelain, and china and earthenware generally, by the School of Pottery at Stoke-on-Trent, which is an interesting example of combined trade enterprise. . . . All these institutions are said to be handicapped by inadequate financial resources. . . . The electrical industry, of course, provides a very wide field for scientific industrial research."

"At an early stage of the inquiry our attention was directed to the fact that an extensive scheme of State aid for industrial research had recently been established by a Committee of the Privy Council, and is, we understand, to be carried out by that department in close communication with the Board of Trade. We are informed that a strong advisory council has been appointed, and that a number of applications (including requests for assistance from the Sheffield University, the Institute of Chemistry, the Stoke Pottery School, and the British Electrical and Allied Manufacturers' Association) are already before that body, and that the first grants are being made. We were accordingly able to refer to the new Council and the funds at its disposal those witnesses who expressed the desire for State assistance in this direction, and to point out to them that the Council in its consideration of any applications for help to any particular trade would no doubt be largely influenced by the extent to which the trade had already shown or would show a disposition to help itself. The new scheme is necessarily experimental, but it is capable of much enlargement, and we have no doubt that if British manufacturers are ready to co-operate with the Government in this matter and to avail themselves of the facilities put at their disposal, the operation of the scheme will be of very great value to British industry."

The recommendations of the Committee on this section of the inquiry are as follows:—

Scientific Industrial Research and Training.—(a) Larger sums should be placed at the disposal of the new Committee of the Privy Council, and also of the Board of Education, for the promotion of scientific and industrial research and training.

(b) The Universities should be encouraged to maintain and extend research work devoted to the needs of the main industry or industries located in their respective districts; and the manufacturers engaged in those industries should be encouraged to co-operate with the Universities in such work, either through their existing trade associations or through associations specially formed for the purpose. Such associations should bring to the knowledge of the Universities the difficulties and needs of the industries, and give financial and other assistance in addition to that afforded by the State. In the case of non-localised industries, trade associations should be advised to seek, in respect of centres for research, the guidance of the Advisory Council of the Committee of the Privy Council for Scientific and Industrial Research.

(c) An authoritative record of consultant scientists, chemists, and engineers, and of persons engaged in industrial research, should be established and maintained by some suitable Government department for the use of manufacturers only.

The Committee next deals with amendments of the existing law as to copyright, patents, trade marks, and merchandise marks. "Under this general heading a large number of representations were made. As regards patents, it was suggested by the representative of the fancy leather goods industry, and endorsed in some measure by the witness on behalf of the china and earthenware trade, that an inadequate search is made by the Patent Office before applications for patents are accepted, and patent rights are granted in respect of articles that have already been upon the market and are in fairly common use. It was urged that a more exhaustive inquiry should be made, responsible trade associations being taken into consultation as to the usage of an article for which an

applicant is claiming a patent. In this connection reference was made to the German and United States practice, and to the supposed fact that in Germany the sealing of the patent protects the inventor against actions for infringement; but we are informed by the Patent Office that whilst both Germany and the United States profess to make comprehensive search, it has proved to be rarely possible to make such a search effective, and that in both countries the patents granted are subject to revision by the Courts. On this last point it was urged that the onus of taking action in the Courts is thrown upon the owner of an article already in use, but for which a patent has been wrongly granted, and that this is an unfair onus to place upon him." Other suggestions were made in favour of international reciprocity in patent matters.

The representatives of the electrical industry made more comprehensive proposals, namely:—

(1) That three classes of patent protection be created:—

(a) A short term or petty patent for improvements or modifications in design, without provisional protection, and at a low cost.

(b) A long term patent for new inventions, the period of provisional protection being 12 months, and the full period to be at least 15 years, with an option to extend it to 21 years by payment of increased fees.

(c) A patent for discovery of new principles, the patentee to be permitted to claim reasonable royalties from patentees of apparatus making use of such principles.

(2) That an attempt be made to bring about the unification of the patent laws of the British Empire."

The Committee consider that the proposals under (1) call for more detailed consideration than they have been able to give them, but as regards (2) the question of the desirability of assimilating the patent laws in the United Kingdom and the Self-Governing Dominions formed the subject of discussions at the Imperial Conferences of 1902, 1907, and 1911, and of communications between the various Governments concerned during the intervening periods. At the Imperial Conference of 1911 it was unanimously agreed "that it is in the best interests of the Empire that there should be more uniformity throughout its centres and dependencies in the law of copyright, patents, trade marks, companies." The proposal made by the witnesses would appear therefore to have been long anticipated by H.M. Government, and an approach towards uniformity has been made in the recent legislation of the Australian Commonwealth and New Zealand. In this connection some exception was taken to a provision of the existing Canadian law, whereby if, after the expiration of 12 months from the granting of a patent, or any extension of such period, not exceeding one year, which may be authorised by the Commissioner of Patents on satisfactory cause being shown within three months of the expiry of the period, the patentee or any of his representatives or assigns, imports or causes to be imported into Canada the inventions for which the patent has been granted, the patent becomes void as to the interests of the importer. It was urged that this provision works to the disadvantage of the British manufacturer, as the importation of any article made under a patent in operation in Canada thus invalidates the patent, even though manufacture thereunder may be actually carried on in the Dominion, but no clear evidence as to hardship was adduced in support of this contention. Canada is the only one of the Dominions which has thought it necessary to embody such a provision in its law, and its action is probably due to the geographical propinquity of the United States. In contrast to this particular complaint of the B.E.A.M.A., one correspondent engaged in the glass industry urged that all British patents should be worked in the United Kingdom, and no articles manufactured abroad for which British patents are granted should be allowed to be imported (with possible exceptions). The same writer was of opinion (which in this instance was shared by others) that the provisions of the patent laws as to compulsory working should be more stringently enforced.

The Committee's recommendations are as follows:—

Patents.—(a) The efforts which have been made to secure uniformity of Patent Law throughout the Empire should be continued. (b) The provisions of the law as to the compulsory working of patents in the United Kingdom should be more rigorously enforced, and inspectors should be appointed to secure that such working is complete and not (as has frequently been the case) only partial. (c) The fullest possible information as to enemy patents should be given to British firms during the war, and every practicable assistance for their use.

The evidence presented showed clearly that there is widespread dissatisfaction with the working of the United Kingdom railway system, and a general belief that the State railway system of Germany is operated greatly to the advantage of the export trade. Thus as regards china and earthenware, we were informed that "the very reasonable cost of transport, and the facilities given by the German Government operate against the (British) pottery manufacturers in competition for the trade of the United States and Canada, and of our Colonies generally." Whilst we have no evidence that rates for inland carriage of goods in Germany are generally lower than those prevailing in this country, when due allowance is made for the differences between the services covered

Transport Facilities.

by the two sets of rates, there can, we think, be no doubt that the German export trade has been largely assisted and stimulated by the special low rates granted on the German railways in respect of goods for export—rates which, in the case of certain combined railway and shipping rates, are believed to have been quite exceptionally low. We are also disposed to think that there is some foundation for the belief that the German railway authorities have, as a rule, shown themselves more ready to give special facilities to individual traders, and to have more regard for their individual circumstances, than has been the policy of the British railway companies. It is evident, also, that there is a widespread belief amongst manufacturers and traders generally that foreign goods are carried inland from British ports at lower rates than those charged for the carriage of British goods over similar distances, and that whatever theoretic arguments may be advanced in justification of such action by the British railways, it does, in fact, operate as an appreciable handicap to British manufacturers in meeting foreign competition. This was urged, for example, by the British Electrical and Allied Manufacturers' Association. It was urged by the representatives of the paper-making industry that railway companies should be required to divide up any through rates charged by them on imported goods, so that the actual rates charged in respect of land carriage could be publicly known. It was stated that a suspicion existed that foreign imported goods are sometimes rated in a different classification to British goods of the same kind.

The Committee direct special attention to two suggestions put forward by the B.E.A.M.A. B.E.A.M.A., namely:—

(1) That the Board of Trade should, as soon as possible, call together a conference of representatives of shipowners, railway companies, and the manufacturing industries, to discuss the whole question with a view to co-operation in removing the existing handicaps under which British industries labour when in competition with foreign producers; and

(2) That an impartial tribunal of the Government be set up to exercise the functions of a tribunal for adjusting grievances existing between railway and transport companies and traders, more particularly where it can be shown that the foreigner is benefiting at the expense of British industry.

"With regard to the second suggestion, in the opinion of the witnesses the Railway and Canals Commission is not a suitable body for the exercise of these functions, as there is no adequate representation of commercial interests and experience, and its procedure is both too slow and too costly. We drew the attention of the witnesses to the fact that the elaborate investigation conducted by the Royal Commission on Railways is only in suspense owing to the war, and we urged upon them the desirability of making full representations to that body, and to furnish in support of their case the fullest possible details, instead of relying, as has not infrequently been the case, on quite general statements. Reference was made by some of the witnesses to the advantages which German trade derives from the facilities for cheap carriage, especially of bulky goods, afforded by its elaborate river and canal system, and regret was expressed at the comparative inutility to which the British canals have been reduced by railway ownership, and at the failure of H.M. Government to take any action on the report of the Royal Commission on Canals. Attention was drawn by some of the witnesses to the handicap imposed on British manufacturers before the war by the fact that in some cases British shipping companies carried continental goods from a continental port to extra-European destinations at freights lower than, or as low as, those charged on the same goods from a British port, even though the continental goods were actually carried *via* such British port.

The Committee's recommendations are:—

Transport Facilities.—(a) An impartial tribunal should be set up to secure that no preference is accorded to traders in other countries by British shipping companies or shipowners, or by home railways; that is, that rates charged by British shipping companies, shipowners and railways to British traders shall in no case be higher under similar conditions than those charged to traders operating from another country, the principle adopted being that equality of payment entitles traders to equality of services. (b) A definite policy for the improvement and extension of the canal system of the United Kingdom should be formulated, with a view to its being carried out so soon as the national finances shall permit. (c) Shipping companies should be prohibited from charging higher rates of freight from British ports than from any North European ports.

Industrial Finance.—"There was a general consensus of opinion among the witnesses that the German manufacturers receive much greater and readier assistance from banks and financial houses than do their British competitors. In a number of cases it was suggested that German industry, and especially the export trade, is actually subsidised by the German Government, but apart from the special railway rates for export, to which reference has already been made, we have no evidence of this, and we are disposed to think that the belief has no other basis than the banking facilities already mentioned. Of the importance of these there can be no doubt. Thus it was pointed out to us by the representatives of the B.E.A.M.A. that there have been carried out by German firms,

in British Dominions and Colonies, many engineering works of considerable magnitude which could have been equally well undertaken by British firms if the latter could have received similar financial assistance. It was also stated that the attitude of British financiers towards home industries is in direct contrast with that of German financiers, who invariably stipulate that the plant and machinery for the undertakings they assist shall be of German manufacture. We recognise fully that the conditions of German industry and its rapid growth in a country not possessed of large accumulated financial resources have caused German manufacturers to be much more dependent on the provision of facilities of the kind now in question than are their British competitors; that the principles of German banking differ widely from those which govern the policy of the British banks, and involve serious risk; and that the imposition of conditions as to foreign loans might exercise an adverse influence upon the position which London had held, until the outbreak of the war, as the chief loan market of the world, with the resultant considerable advantage to British trade as a whole. At the same time, some witnesses appeared to think that there is a large body of British manufacturers to whom a well-ordered system of industrial banks would be of very appreciable assistance. In this connection our attention was drawn to one disadvantage of the recent development of the joint-stock banking system. It was suggested to us that the old local proprietary banks were more inclined to give credit to local small manufacturers, with whose position they were intimately acquainted, than are the great combinations into which the local banks have generally been absorbed. The local manager is unable to take the risk which the local banker often took, and is indisposed to advise his principals to make any advances which even appear to carry with them any element of risk. We are of opinion that there is a good deal of truth in this view of the situation, and that the development of joint-stock banking has in some measure restricted the financial facilities of the smaller industrial enterprises."

The Committee recommends:—

Financial Assistance.—(a) The Joint Stock Banks should be invited by H.M. Government, so soon as opportunity offers, to consider the possibility of affording a greater measure of assistance to British industrial enterprise. (b) All Government departments, local authorities, and statutory bodies entrusted with the control of moneys raised by taxes or rates, should be under legal obligation to purchase, so far as possible, only goods produced within the British Empire. To meet exceptional cases, the Board of Trade might be empowered to grant licences to public bodies for the purchase of foreign goods where special circumstances, including, for example, the existence of a combine or "trust," can be proved. (c) British financial houses concerned in the issue of foreign loans in the United Kingdom should be urged to endeavour to secure that preferential treatment be accorded to British contractors and manufacturers in respect of the public works to be carried out by means of such loans.

(To be concluded.)

MUNICIPAL ELECTRICITY SUPPLY AT JOHANNESBURG.

By R. TURNBULL MAWDESLEY.

(Concluded from page 155.)

In the inner areas the cables have been laid underground as far as possible, but in the suburban areas the wires are carried overhead, and this is a certain source of trouble during the very severe lightning storms which occur in the summer months.

The street lighting, on those streets along which the cars run, is carried out by incandescent lamps suspended from the trolley-span wires, and by incandescent lamps on pavement standards elsewhere.

Average summer and winter load curves are shown in fig. 12. (It should be noted that, as Johannesburg is south of the Line, the winter months are from April to September.)

The curves shown do not differ in any material way, in shape, from those of the moderately-sized lighting station at home—and it is strikingly obvious, on inspecting the shape of the Johannesburg load curve, that the installation of a storage battery of large capacity would be the means of cutting off the peak, and filling up the valley after 10 p.m., and thus considerably increasing the station efficiency.

The great difference between the summer and winter curves is due to two causes—one being the cold weather (when many electric heaters are in service), and the other the shop and office lighting, all shops promptly closing at 6 p.m.

The direct-current load on the converters is also given, and it will be noticed that in the summer time the converter load drops considerably before the peak load. The reason for this is that the two turbines (6,000 kW.) on load, are loaded up by the A.C. feeder load before the converters can be fully loaded on the D.C. side.

In the winter time the converters can be fully loaded at the peak, as there are then three turbines (9,000 kW.) on load. A slight alteration has recently taken place in the average shape of the curve, and especially the converter load curve, owing to the rotary sub-station at Jeppestown taking part (about 18 per cent.) of the traction load. When the second rotary sub-station at the "Zero" is in operation, about 80 per cent. of the traction load will be handled by the sub-stations; and the D.C. generators (and converters) in the main station will be relieved of this amount of load.

During November, 1914, 1,248,457 units were generated for lighting and power, and 597,277 units for traction. These statistics cover a summer month, and the figures would be higher for a winter month. The total number of connections made at the end of November was 15,625 kW.

Referring briefly to the tramways, there are 124 cars in daily service, the cars being partly of the single-truck double-deck type, with the upper deck roofed in, and with adjustable blind screens at the sides, and partly double bogie cars of the same type.

There are also in service at the time of writing two Tilling-Stevens petrol-electric single-deck "pay-as-you-enter" buses, which are used as feeders to the tramways.

FIG. 12.—AVERAGE DAILY LOAD CURVES.

The minimum fare is 1½d. Incidentally, it may be observed that until quite recently the "ticky" (three-penny silver piece) was the coin of smallest value in general circulation, and even daily newspapers were sold at this price; but this artificial price was reduced recently to 1d., which in its turn has brought about a more general circulation of "coppers."

There is an agitation for the substitution of 1d. fares, but the general manager, in a report upon the subject, recommends the Committee to retain the existing fares for the time being; however, there can be little doubt that 1d. fares will be substituted in the near future.

"Change" on the cars is given by means of tokens valued at 1½d., and books of tickets are on sale at 33 per cent. reduction.

Regarding the permanent-way construction, there is nothing of note to be recorded. In the main thoroughfares the trolley wires are supported by span wires, and elsewhere by side-arm poles.

One petrol-engine tower-wagon and two track tower-wagons are in service for breakdowns and maintenance, and the whole of the cars are housed in sheds adjacent to the power station. The necessary repair shops, &c., are all centrally situated.

The tramway traffic returns do not vary to any extent, except upon holidays or *fête* days. For the week ending

August 8th, 1914, the figures were (as compared with the same period of 1913):—

	1914.	1913.
Car-miles run	66,369	65,873
Receipts	£6,305 14s.	£6,586 8s.
Average receipts per car-mile	22 8d.	23 9d.

The average number of passengers carried monthly is 2,600,000, and the average car-milage is per month about 275,000. The present average receipts per car-mile are 2s. 2d., with 9.5 passengers carried per car-mile.

The concrete and stone building which housed the gas-engine plant has been converted partly into a car-repair shop and partly into a car-shed. This building also contains a small motor-generator for the purpose of charging the cells of an electric vehicle used in distribution work.

There is a fleet of three motor-cars for the use of the Departmental officials, and a number of motor-cycles for the mains foreman, which are all garaged and kept in order by the Department.

Finally, no account of the Johannesburg power plant would be complete without some reference to the assistant engineers who have shared in the work. Mr. E. T. Price is the chief electrical engineering assistant, under whom all electrical engineering work is carried out. Mr. J. B. Milford is the traffic manager of the tramways, and Mr. O. Petersen the resident station engineer.

NOTES FROM CANADA.

[FROM OUR SPECIAL CORRESPONDENT.]

THIS country, like the rest of the Empire, is devoting its energies largely to war, and a large part of the trade, even in manufactures other than war materials, is more or less indirectly an outcome of the requirements created by the demand for munitions, uniforms, &c. Naturally, a good deal of capital is being expended on the establishment of new, and the extension of existing, works and factories for war work, but side by side with this there is a considerable amount of planning for the future, based on the confident expectation that the Allies will be victorious.

On the outbreak of war Canada had many unemployed, and people wondered how she would come through; but now, owing to enlistments and to the enormous increase in the country's trade—this increase is altogether in exports, as imports have dropped very greatly—there is but little unemployment and the Dominion prospers financially as never before. If only this prosperity were unaccompanied by the sadness and sorrows which come to so many of those who have relatives at the Front, there would be cause for rejoicing indeed.

Apart from these things, conditions are much as usual; there are, of course, no Zeppelin raids and no darkening of streets and window lights, and it is not for the presence of innumerable soldiers at every turn, the average man not engaged on war work would hardly notice much difference from ordinary peace times.

In the field of electrical engineering, several fairly big schemes are being projected.

At Edmonton, in Alberta, an agreement between the city and the Edmonton Power Co. has recently been approved.

The company is to supply electricity for 30 years, at prices ranging from 1.3 cents per kW.-hour to 0.85 cent, according to the demand. The power of the Saskatchewan River will be utilised, but an artificial lake will have to be created, and a total ultimate expenditure of about £1,200,000 is contemplated. Edmonton at present has a steam plant, and the company undertakes to run this until the hydroelectric scheme is in operation, which will be some three or four years hence.

The Montreal Tramways Co. is increasing its present steam plant from 10,000 H.P. to 50,000 H.P., and another plant in this city is to be built having a capacity of 60,000 H.P. A 15,000-H.P. steam turbine unit will be the first to go in.

One of the great features recently has been the voting of the people of various interested municipalities in Ontario on the question of hydro-radials. A little explanation appears necessary here: the Hydro-Electric Power Commission of Ontario has for some time been working on plans for a system of electric railways to form a network linking up the important towns, and providing facilities for rapid and cheap passenger and freight service serving both towns and rural districts.

A start on this kind of work was definitely made when the formal opening of the London and Port Stanley Railway took place last July.

The Commission undertook the work of electrifying this line, which was formerly steam-operated, and is about 30 miles in length. It has been working successfully since the summer, and is now said to be making a profit of about £200 per month.

At the January elections, which took place on the 1st of this month, the people of the towns and country districts concerned were asked to vote on the question whether they wished the Hydro-Electric Power Commission actively to take up the "hydro-

radial" work or not. This resolved itself into a question of public versus private ownership, and a big fight was made by the advocates of the latter, but the Commission carried the day with, in nearly every instance, very large majorities. The vote was given on the understanding that only preliminary work will be undertaken during the war, as the spending of such a large sum of money as even the present plans would involve would be a wrong policy just now, covering, as they do, an area nearly as large as England, in South-east, and especially in South-Western, Ontario.

Another matter closely connected with the foregoing is the absolute necessity under which the Commission is even now placed of going ahead with some scheme for securing more power. Five or six years ago a contract was made with the Ontario Power Co., at Niagara Falls, for the supply of power, in blocks as required, up to a maximum of 100,000 H.P. At the time Sir Adam Beck was told that it would be 20 years before he would require even 10,000 H.P., or something to that effect, but a few weeks ago the Commission's maximum load exceeded 110,000 H.P., and it is steadily growing as new municipalities are taking power, and those already connected to the system are increasing their demands. This tremendous growth has enabled the Commission to reduce the rates charged to the municipalities each year, and this month reduced rates for no fewer than 66 towns and rural districts have been published; in some of them the consumers will get energy for domestic service at as low a rate as 0.9 cent per kw.-hour.

In order to meet the demand for power, the Commission has had to make arrangements with another company at Niagara Falls, but the price being paid is naturally much higher than for the 100,000 H.P. originally contracted for.

Plans have already been drawn up by the Commission's engineers, however, for a scheme whereby 600,000 H.P. can be developed at Niagara Falls on the Canadian side, and these will be considered by the Provincial Government next month, when it is highly probable that approval will be forthcoming, as now that the people have expressed their desire to have publicly-owned electric railways, the development of this power is a greater necessity than ever.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Driving Paper-Making Machinery.

A catalogue recently issued by MESSRS. MATHER & PLATT, LTD., of Park Works, Manchester, which deals, not with paper-making machinery itself—for the firm does not produce this class of apparatus—but with auxiliary machinery that is of importance in paper mills, contains illustrations of electric motors that have been supplied to paper mills throughout the country; included

FIG. 1.—ELECTRIC DRIVE OF SUPER-CALENDER.

amongst these is the interesting application shown in fig. 1, which illustrates a 100-H.P. "P" type motor driving a 10-bowl super-calender in a H. W. paper mill. In order to obtain, in the most economical manner, the minute variations of speed over a very wide range that are necessary in operating a super-calender, a motor-driven booster is provided. This arrangement permits of obtaining any speed between 30 ft. and 500 ft. per minute by the movement of a small hand-wheel, without loss through the

employment of resistances. Among the largest paper-mill installations for which the firm have been responsible is that at the works of the Culter Mills Paper Co., Peterculter, Aberdeen, where upwards of 30 motors, with an aggregate capacity of 500 H.P., have been installed; the Darwen Paper Mill Co. uses a D.C. Mather & Platt generator of 200 kw., and Messrs. Chas. Marsden & Co., Ltd., Barnsley, employ a rope-driven 350-kw. generator and a smaller set with an output of 85 kw., the motor equipment including one of 100 H.P. and about 30 others, with a combined horse-power of something like 550. At the East Lancashire Paper Mill, Riddcliffe, also, 30 similar motors are running, totalling over 500 H.P., and taking current from three generators with an output of about 550 kw.

Large Jackson Cookers.

We briefly referred in our issue of December 25th to the large Jackson electric ovens being constructed for the Park Prewett Asylum, which is being adapted for hospital purposes. Two large ovens and three smaller ones are being supplied, the former built up with a cast-iron framework, sheet-metal sides and double doors, and the latter consisting of a cast-iron oven with a sheet metal grill above it. Both types of equipment are lined internally with porcelain enamelled steel and suitably lagged.

The large ovens measure internally 2 ft. 9 in. wide \times 2 ft. 6 in. deep and 4 ft. 6 in. high, and will take 300 lb. of meat. They are heated by nests of red-hot type heating bars disposed on either side, and consisting of 44 of the standard Jackson bars, described in our issue of December 25th, arranged to give the required heat distribution. These heating elements are protected by perforated metal plates inside the oven. Four heat regulations are provided, controlled by four single-pole Diamond H switches, and the maximum loading is 15 kw.

The smaller type of oven supplied measures 26 in. \times 24 in. \times 23 in. internally, and has a loading of 5.5 kw., with three heat regulation, the oven heating being on similar lines to the larger oven; the grill above has a 6-kw. loading. In both types of oven the wiring to the heaters is external, with non-combustible covering, and is run in sheet-metal casing to the back and thence through flexible metallic tubing to the switchboard.

We are indebted to the JACKSON ELECTRIC STOVE CO., LTD., of Blandford Street, W., for allowing us to inspect this interesting equipment.

PROTECTION FROM X-RAYS.

At the meeting of the Röntgen Society on February 1st a discussion took place on the subject of protective devices for X-ray operators. DR. SIDNEY RUSS, the opener, pointed out that although X-ray dangers were becoming less formidable, owing to the more general knowledge of the peril, yet at the same time the neglect of precautions was all the more serious on account of the increasing power of X-ray outfits. The X-ray outfit of the most modern type was capable of fifty times greater power than the ordinary outfit of ten years ago. He thought that X-ray workers would prefer not to invoke legislation on this subject if sufficient protection could be obtained by other means, for of all the methods available for ensuring it, legislation would be the least popular and the least convenient. He and other speakers suggested that certificates of safety should be given with X-ray apparatus.

In the course of the discussion, MR. H. E. DONNITHORNE showed that even protective devices themselves might be a source of danger, instancing a couch which was furnished with a protective metal surface at a certain angle which the X-ray beam was just able to graze. The incident radiation was thereupon increased, and this he attributed to the generation of secondary rays from the metal itself.

DR. F. BAILEY, of Brighton, said that his own practice was to shelter himself behind a large screen, the upper third of which consisted of lead glass and also to enclose his tube in a large lead-glass bulb. In this way the operator could hardly receive any direct X-rays at all, but he still remained subject to the ionised atmosphere of the X-ray room and its possible dangers.

DR. W. HARWOOD NUTT said that some X-ray workers were returning from the seat of war with very bad ulcers on the arms and hands, and he did not believe that any man could protect himself adequately, however much he was clothed with aprons and gloves, &c., unless the tube also was enclosed. The effects of a atmospheric ionisation might be overcome by efficient ventilation, using two electric fans, one drawing the air into the room, and the other drawing it out.

DR. HESCHEL HARRIS thought that the great fault was in the glass supplied for protective purposes. It was often not lead glass nor X-ray proof at all, and the makers should be asked in all cases to notify their customers as to the quality of the glass they supplied.

Copper in Germany.—The quotations for copper wire in Germany have shown a steady rise. For 100 m. of insulated wire of 1 mm.² section 45 francs is paid, and, in some cases, even as much as 60 francs is asked. The quotations for zinc wire, on the other hand, seem to be quite normal, and this metal is generally employed.—*L'Industrie Electrique.*

THE EASTBOURNE FATALITY.

The following report has been prepared for the Board of Trade by its electrical adviser, Mr. A. P. TROTTER, with reference to the fatal accident which occurred at Eastbourne in December last:—

On December 26th, 1915, a large motor car, proceeding at a moderate speed along the near side of a broad thoroughfare in Eastbourne, named Seaside, unaccountably swerved to the left and smashed an electric switch pillar into fragments. It was brought up by collision with a tree a few feet further on. The occupants of the car, two nurses and two children, were unhurt, but two men who afterwards tried to move the car were killed by electric shock. There are no obscure or doubtful points about the accident. The circumstances are quite clear.

The pillar was about 4 ft. x 2 ft. 2 in. x 1 ft. 9 in. It was constructed of cast iron; the minimum thickness was about half an inch. It stood at the edge of the footpath, which was not provided with any curb. The pillar contained three switch-fuses of the cartridge type for the purpose of connecting cables branching in three directions from this point. The cables are lead-covered, paper-insulated, concentric, for a supply of single-phase alternating current at 2,200 volts. At about 6 in. above the ground level there was a horizontal bus-bar to which the external conductors were connected by links. The lower part of the switch-fuses was about 3 ft. above the ground level, and they were connected with the inner conductors of the cables by "tails" of 7/16s about 18 in. in length. When the pillar was destroyed no connections pulled out, but the "tails" were cut through, and the end of one showed signs of fusion.

The pillar was supplied through a feeder, and owing to a momentary earth at the instant of the collision, the oil-switch on this feeder at the works tripped. The switchboard attendant replaced it, and it held in, showing that there was no short-circuit or heavy earth. The supply was further complicated by being fed from a sub-station, and by the stepping-up through transformers of the low-pressure supply, but that need not be considered.

Two men tried to push the car back on to the road. Several persons who touched it received shocks. The driver alighted and opened the bonnet, and received a slight shock which he attributed to the electrical accumulator on the car. The severe shocks received by the two men may have been due to the firm grasp which they gave, or perhaps the car did not make contact with the upstanding wire until it had been moved. It was not clear from the evidence given at the Coroner's inquest whether the car was moved or not. That is of no importance.

The driver attempted to pull one of the men off by grasping his waist with both hands. In doing this he received a shock of sufficient strength to knock him down. An attempt was made by the bystanders to pull the men off with a wire rope. They received severe shocks and burns. If a hemp rope had been used, the day being dry, they might have rescued the men without difficulty, or they could have pulled them away by loose parts of their clothing. If after getting them clear the well-known method of artificial respiration had been practised, the lives of these two men might have been saved.

If the pillar had been smashed by a runaway vehicle constructed mainly of wood, such an accident would hardly have occurred, and if by a traction engine with iron wheels, it would have been impossible, for a better contact with earth would be made by the wheels than by the feet of the bystanders. The insulation of the car on its rubber tires was an important cause of the fatal result.

The Board of Trade Regulations recognise sub-stations and street boxes. The former are receptacles for transformers large enough to admit the entrance of a person after the transformers, &c., are in position. It is recommended that they should be above ground whenever possible.

The regulations relating to street boxes imply that they will be constructed below the level of the road or pavement, and will be provided with covers forming part of the surface of the street. In addition to regulations relating to sub-stations and to street boxes, Regulation 18 provides that "every portion of any high-pressure electric line placed above the surface of the ground shall be completely enclosed either in a tube of highly-insulating material embedded in brickwork, masonry, or cement concrete, or in strong metal casing efficiently connected with earth."

Pillar boxes of a kind similar to the one which was destroyed at Eastbourne have been broken by collisions with vehicles, and until recently a pillar of the dimensions and construction of this one might have been considered to comply with the regulation. But in view of the increased speed and weight of street vehicles, and their imperfect control and skidding, further attention must be given to the use of such electric pillars in the streets. This is not the first case in which the cast-iron case of a pillar has been destroyed without causing a dead earth or short-circuit among the live conductors contained in it.

Various troubles with underground street boxes resulted in the introduction of pillars, but local authorities have, with but few exceptions, permitted their use only on their own electrical undertakings. For low-pressure work, pillars present many advantages over street boxes, and are to be recommended. In the case of high-pressure distribution the acci-

dent to be feared was the possibility of the pillar becoming alive due to the bad action of a fuse or to some other defect. It was anticipated that both in the case of large transformer kiosks and of such pillars as are used at Eastbourne and elsewhere, any serious damage by a car would cause an earth or a short-circuit which would trip the supply switch.

In most of the larger modern systems of electrical distribution supply is given at extra-high pressure to sub-stations from which medium or low-pressure mains distribute the supply to consumers. In such cases there are no high-pressure mains, and no switch pillars are used.

In older systems, such as that at Eastbourne, high-pressure feeders, originally radiating from the generating station, have become a highly complicated network. This generally arises from the necessity for tapping fees to feeders for the supply to new districts. It would be desirable in these cases that sub-stations should be increased in size or in number, and that the use of street-box transformers should be restricted, and that the lay-out of the feeders should be so simplified that tee-joints are avoided and that switch pillars or boxes need be used only in exceptional cases.

Before proceeding to consider what modifications should be made in electric switch pillars, the employment of high-pressure switches in underground street boxes may be mentioned. Many engineers have strong objections to this alternative, chiefly on account of danger to workmen who have to use them, and on account of failure of such apparatus to work properly. But investigation shows that this is another way of stating the fact that many objectionable kinds of street-box switches have been tried, the unsatisfactory results have been very apparent and sometimes serious, while a few well-designed underground high-pressure switches have worked well for years and neither require nor attract attention. Besides these, which are non-automatic and do not contain fuses, totally enclosed oil-switches with overload trip are used in mines, and could easily be adapted for street boxes.

RECOMMENDATIONS AS TO ELECTRIC PILLAR BOXES FOR USE WITH HIGH-PRESSURE SUPPLY.

1. The suggestion made by the Coroner's jury that pillar boxes should be placed further away from the side of the road is good. It is better to place them in side streets than in main thoroughfares. If possible, they should be built into the walls of houses or gardens. Local authorities should use their influence to obtain accommodation for such boxes on reasonable terms.

2. Where pillars can be moved back from the curb by slewing the cables without entailing undue expense in cutting and re-jointing, this is desirable.

3. A curb not less than 6 in. high extending not less than 10 ft. on each side of the pillar is desirable.

4. Where pillars are set near a curb, feeders or "spurs" of rounded blocks of stone or of strong iron castings could usefully be set at the corners of pillars facing the road. A door opening on to the street must be shaped to clear them.

5. Cast-iron pillars should be reinforced by a cage of wrought-iron rods incorporated in, or attached to, the cast-iron, which will tend to hold the fragments together in case of destruction, or an inner lining of sheet or of expanded metal or wire mesh should be attached to the pillar and to the doors, and the pillar should be connected to a substantial earth-plate as well as to the lead of the cables.

6. Loose "tails" of rubber-covered wires are highly objectionable, and should be avoided by enclosing them in a metal tube carefully earthed, and filled in solid with compound.

7. It is not desirable that transformers should be placed in pillars above ground, unless loose wires and cables and exposed live parts can be altogether avoided. Where street boxes are used as transformer chambers they should be placed below ground, and properly designed switch pillars may be set over them, or, preferably, they may be built into a wall.

8. The foregoing recommendations may be applied also to low and medium-pressure pillars.

THE DESIGN OF HIGH-PRESSURE DISTRIBUTION SYSTEMS.

In the course of the discussion on Mr. Beard's paper by the WESTERN LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS, Mr. W. A. CHAMEN said that he took the author's statement that as time went on they would do more and more of their distribution at high pressure to mean that they would do far less of what he called low-tension distribution from any one sub-station. They would cut up their areas, and divide them over a much larger number of E.H.T. transformer sub-stations. It would be of interest to know what would be the effect if some of the waste-heat stations, from accident or any cause, suddenly ceased giving their supply.

With regard to overhead lines in South Wales, in each case when they put up an overhead line working at 11,000 volts the birds had at first been a great trouble. They stood on the cross-arms or pole tops and managed to reach the wires, causing a short-circuit, and sometimes shutting down the supply as well as killing themselves. This happened for a little time,

but soon the birds began to learn—at least the next generation of birds did—that it was dangerous, and this trouble ceased.

Mr. J. W. BURR said he supposed the author's idea was to have many high-pressure sub-stations and to supply only in the immediate locality of these sub-stations with low pressure. This would obviously require not only a great number of sub-stations but also a dense distribution area in their neighbourhood. The majority of central station engineers had not to deal with an area in which this was possible. Regarding the suitability of supply, obviously this must suit the consumers' requirements. A short time ago he was requested to give a supply to a large works, and suggested that they should take low-tension 3-phase alternating current. It was, however, pointed out that they had already a continuous-current installation at 235 volts, and it was therefore necessary to install a rotary converter at their particular voltage or lose the business. He agreed that money spent on preventing or minimising an interruption to the supply was money well spent, since reliability of supply must be one of their first considerations. In some cases the use of automatic apparatus was overdone; he would rather rely to some extent upon the attendant and employ qualified men. After all, even automatic contrivances sometimes went wrong. He suggested that a frequency of 50 was high for power distribution. The inductance voltage was directly proportional to the frequency, and as this factor limited the power which could be transmitted over any line it surely should be reduced as much as possible. He had been under the impression that switchgear was designed to-day that would operate successfully under almost any condition of working. He was of the opinion that it did not normally pay to operate cables at the maximum current density allowed by heating limits.

Mr. C. F. PROCTOR inquired what was the maximum output of the Newcastle stations, and the proportion between the power generated by the waste-heat stations and that of the main stations. He also asked whether in extra-high-tension switchboards trouble had been experienced from static charges of the parts; in a 17,000-volt switchboard he saw tested some years ago he noticed that sparks passed between any two metal parts (such as two screws) close together, although they were not supposed to be in electrical contact with any live parts.

Mr. F. TREMAN was surprised to hear that the breakdowns of overhead lines were only twice as frequent as those on underground cables. A 2 to 1 ratio did not seem, at first sight, to be sufficient difference between overhead and underground systems to justify the greater cost of subterranean cables.

Mr. C. T. ALLAN agreed that the interconnected system was the most economical, but the problem was how to introduce the protective apparatus upon an existing system having cables already laid. With the protective systems mentioned by the author, reliance for the operation of the clearing circuit breakers had to be placed upon current transformers, and he found that trouble with current transformers was occasionally experienced during lightning storms, so that they could not be considered infallible. He could recommend the use of high steel poles, because wilful breakage of insulators was avoided; it was practically impossible to break an insulator on such a pole except by using a rifle. His experience had been that the proportion of breakdowns on overhead lines was no greater than with underground cables, and certainly for quickness and ease of repair, overhead lines were to be preferred.

In reply, Mr. BEARD said that in several large towns extensive networks were being divided into sections fed from different sub-stations; on the North-East Coast, no extensions were being made to D.C. networks or to rotary sub-stations. The large number of generating stations was due to the existence of sources of waste heat, but for which the area would have been supplied from not more than three power stations. If a waste-heat station failed, the local supply was derived from the main system, and the loss in generating capacity could be made up by the spare plant at the coal-fired stations. In the event of waste-heat stations being shut down by a strike, there would usually be a corresponding drop in the load on the system. The same trouble had been experienced with birds in the North as in South Wales, and recent lines were being carried on suspension insulators. Sometimes a flock of birds might settle on a particular wire, and increase the sag so much that the wire or a bird on it comes into contact with the wire of another phase. Wayleaves were required for high-pressure overhead lines, because these could not be erected along a public road; underground cables, on the other hand, could be laid in public roads without any wayleave. The choice of frequency depended mainly upon the plant and consumers' apparatus, and had little to do with the distribution system. On the N.E. Coast system two years ago the output exceeded one million units a day, but owing to the high load factor the maximum demand had not yet reached 100,000 kw. The units generated by the waste-heat stations were about one quarter of the total. Surge effects did not cause much trouble on a large system, and the less apparatus they had for protecting against surges, the less trouble they experienced. For the overhead lines, they relied entirely on taking them into sub-stations through a short length of underground cable, which device had proved strikingly successful. All metal parts of switchgear that were not alive were earthed. The split-conductor system was the best to deal with breakages on overhead lines, which were otherwise very difficult

faults, owing to the resistance of a broken wire to earth being sometimes from 50 to 100 ohms. Where cables had already been laid, the balanced-current system could only be applied by laying pilot cables; but when converting an old radial system into an interconnected one, it was better to group the old feeders in pairs and treat the double cable as a single split-conductor feeder.

WAR ITEMS.

German Engineering Industry.—Herr Fröhlich, the secretary of the Association of German Engineering Works, recently addressed a gathering of engineers in Würtemberg on "Industry and the War." There was, he said, no scarcity of the two most important raw materials, coal and iron, and the present production of pig-iron and steel exceeded the requirements of the Empire. Although the commandeering of metals by the Government had at first caused great difficulties in the engineering industry, these had been overcome, thanks to the adaptability of the works. Economy in the use of high-speed steel was necessary. The home trade had been but little affected by the war, and hardly any contracts had been cancelled; although in some cases execution had been postponed until after the war. Very few new contracts had been placed, but the absence of such was made good by the increased Army orders. As a result of the pressure put upon the industry by the military requirements the German works had acquired an experience in the rapid construction of automatic machines and in turning out machines on a wholesale scale which must have a beneficial effect upon the whole industry. The months of war were months of learning which would lay the foundation of future technical progress. The export trade had suffered greatly, for it must be remembered that in normal times about one-third of the total output of the German engineering works was exported. After the war neutral countries would probably act to a great extent as intermediaries in introducing German goods in what were now enemy countries.—"Ironmonger."

Bolton Corporation and its Contracts.—At the monthly meeting of the Bolton T.C., on February 2nd, information was sought as to whether the firm of Messrs. Falk, Stadelmann & Co., Ltd., to whom moneys had been paid by the Electricity Committee for fittings, and by the Gas Committee for mantles, was a British firm. Councillor J. H. Crook said the capital of the company named was £392,790, all the directors were British subjects, as also were the shareholders, with one exception. The firm traded with various Government departments, and no fewer than one hundred of its employees were serving with the Forces.—Councillor Haythornthwaite (who originally raised the subject) said that the last speaker was misinformed, or else he himself was misinformed. According to a document issued by the Companies Registration Office in November, this company was registered in October, 1913. The total capital was £392,790, of which £78,447 was held by two German subjects in Germany, £2,200 by a German subject in this country, £190,721 by three naturalised subjects of German origin, whilst the remaining £95,470 was held by the wife and daughters of a German member of the firm, a naturalised German. It was up to the Corporation committees to see that they did not have German goods foisted upon them.—The Mayor (Alderman Seddon) said there was a difference between two members, and he thought the Council might leave the matter with the two, along with himself, to see which of the statements was correct.—It was decided that the subject should be inquired into in this way.

Coal Supplies.—The Board of Trade announces that owing to the increasing demands of industries connected with the war, the difficulties with regard to fuel supplies to which the Board called attention on December 1st last have become more pressing in certain districts. It was decided, therefore, to appoint, on the nomination of the various coal-owners' associations, district coal and coke supplies committees, with the object of ensuring that colliery firms and other important consumers obtain the supplies they need with as little delay and friction as possible. Committees have been formed, or are in course of formation, in many districts. It will be the business of these committees to see that the resources of their districts are utilised to the best advantage, and that the requirements of important industries are fully met. Any recommendations that they may be able to make with a view to greater economy in the use of coal will be carefully considered.

"Re-fitting" Wounded Soldiers.—In connection with the work of "re-fitting" wounded soldiers for industrial employment—a subject to which great attention is being paid in Germany—an exhibition of artificial limbs has just been opened in Charlottenburg. Not only are the exhibits numerous, but they show that marvellous progress has been made in providing men who, in the war, have suffered the loss of arms or legs, with artificial limbs that will not only enable them to perform ordinary duties but to follow their old employment.

A New German Price Advance for Machinery.—The leading firms in Germany belonging to the price convention for heavy electrical engineering manufactures, have just made a further increase of 10 per cent. in the list prices owing to the present situation of the market for raw materials, thus making a total advance of 40 per cent. The higher charges apply to machines and motors, including electrically-driven ventilators, pumps, boring machines, etc., starting appliances, regulating resistances, controllers, oil, lever and automatic switches, and railway materials, whilst the list prices for machines and motors of over 100 h.p., as well as for transformers, continue suspended. Further increases are reserved in the case of articles for purely peace services. Among the firms who have signed the circular announcing the alteration are the A.E.G., Siemens-Schuckert, Bergmann, and Brown-Boveri.

Women as Engineers.—Speaking on "Women's Work during and after the War," at a meeting of the Royal Society of Arts, Lady Parsons said that a new field for women's enterprise seemed likely to develop in the important industrial profession of engineering. "It would be a great advantage if provision could be made for some educated girls to go through the shops and gradually take control of unskilled women-workers. If a favourable opportunity were to arise for establishing a factory for women it would be a great step towards organising all our resources. She suggested that women might specialise on making some of the innumerable articles that we bought from Germany before the war, such as motor-cars, cycles and parts, electrical machinery, sewing machines, cheap clocks and watches. It was clearly a case for the Government to give a lead."—*Times*.

After the War.—The Lambeth and Battersea B.C. have passed the following resolution, copies of which have been sent to the Government, the members of Parliament for the borough, and Metropolitan B.C.S.:—"That the time has arrived for legislation to be framed to protect our people against the return of trading aliens after the war; that such legislation should take the form of licensing all professional and trading concerns."

Glasgow Corporation and Enemy Contracts.—The Special Committee on Standing Orders recommends the Glasgow Corporation to resolve:—"That during the period of the war no contract be entered into with any person of German or Austrian nationality; or with any firm or company whose subscribed capital (whether by way of shares or otherwise) is held or controlled to the extent of one-third or upwards by persons of German or Austrian nationality."

Australia and Enemy Shareholders.—Reuter's Melbourne representative states that the regulations approved by the Federal Executive for the wiping out of enemy and naturalised shareholders in public companies, and making the transfer of their shares to the Public Trustee until a year after the war obligatory, also apply to persons on the London registers of Australian companies.

Excess Profits.—All applications or appeals respecting the excess profits duty should be sent to the Registrar, Board of Referees (Finance (No. 2) Act), Refuge Assurance Building, 133, Strand, W.C.

Controlled Works.—There are now 2,720 establishments controlled by the Minister of Munitions.

ought to be given, and, if so, under what conditions. The Judge thought that the consent ought to be given upon the terms that Mr. Hutchings should receive a rental of £5 a year. The Postmaster-General was dissatisfied with that decision, and the matter came before that Court in consequence. It was clear that in dealing with the application they must regard Mr. Hutchings not in his capacity as owner of the adjoining land, but as the owner of the soil of any roads dedicated to the public. If Mr. Hutchings should suffer any damage as the owner of the land, the Act provided in clear terms for his compensation. It was a very unusual thing for a County Court Judge to say that a rental should be paid to the owner of a street. It appeared to the Court that it was inconsistent that he should be given a rental for that which did not affect his proprietary interest. There was no ground for saying that the Postmaster-General should pay a rental to the owner of the soil of the public road. If Mr. Hutchings could show that in his capacity of owner of the soil of the roads he would be put to any expense or damage it would be right to safeguard him. The Postmaster-General, however, would make good any damage, so that Mr. Hutchings would suffer no pecuniary damage whatever by the erection of the poles. Every possible provision would be made by the Postmaster-General to safeguard Mr. Hutchings against having his roads made unsightly. The Court, therefore, had come to the conclusion that the condition imposed by the learned County Court judge ought never to have been imposed, and that the Postmaster-General ought to be relieved from it and consent given to the application.

SUB STATION ATTENDANTS.

A CASE of interest to central station managers and employés was brought before the Local Munitions Tribunal for the Metropolitan District at Caxton House on the 3rd inst., at the instance of W. J. Ebben, who complained that the consent of the Poplar Electricity Department to his leaving its employ was unreasonably withheld. The complainant stated that he wished to leave because he was at present engaged on work which did not utilise his engineering skill and his training as a skilled mechanic to the full: he was only required to work 48 hours a week, and an improver was doing the same work for 30s. a week.

MR. J. H. BOWDEN, electrical engineer to the Borough Council, pointed out that the improver would eventually have the same status as the complainant, but was not yet sufficiently qualified to be placed in full charge of the work; 48 hours was the usual week in that class of work, for which no special skill was required.

After hearing the evidence of Mr. Bowden, the Court unanimously decided that the certificate of release asked for could not be granted. By this decision, the electricity supply undertaking appears to be placed on the same basis as a controlled establishment.

THREAT TO CUT OFF SUPPLY AT WEST BROMWICH.

ON February 4th, in the Chancery Division, Mr. Justice Eve heard a further motion in an action against the Corporation of West Bromwich, in which the plaintiff asks for an injunction to restrain the defendant Corporation from cutting off electrical energy with which he alleges they contracted to supply him.—Counsel said the motion would have to stand over for a short time, and the Corporation had agreed to abide by the undertaking they had given until the dispute was decided.—His Lordship assented.

LEGAL.

POSTMASTER-GENERAL v. HUTCHINGS.

MR. JUSTICE LUSH, the Hon. Gathorne Hardy, and Sir Jaa. Woodhouse, sitting as the Railway and Canal Commission on Monday, February 7th, had before them a case in which Mr. A. B. Hutchings, the respondent, as the owner of an estate at Seaford, in Sussex, which was laid out for building purposes and intersected with roads not yet built upon, sought to uphold a decision of the local County Court judge that the Postmaster-General should pay him £5 a year for the privilege of placing telephone poles on certain portions of the roads, a decision to which the Postmaster-General objected.

MR. H. L. MURPHY appeared for the Postmaster-General, and the respondent appeared in person.

MR. MURPHY said that the matter came before the Court by way of a reference under Sec. 4 of the Telegraphs Act of 1878.

MR. JUSTICE LUSH, in giving judgment, said the question had been raised as to whether the roads were private or public within the meaning of the Act, and, in the opinion of the Court, it was quite clear that they were public roads, and had been used by the public for some 15 or 16 years. Being public roads not taken over by the local authorities, Mr. Hutchings was still the owner of the soil, and was, therefore, a person who, within the meaning of the Telegraphs Act of 1878, was entitled to withhold his consent to the placing of poles on the roads. The Postmaster-General desiring to place telephone poles on the road, and to place the wires under the streets, application was made to Mr. Hutchings for his consent, which he did not give, and differences had arisen between the parties. Under Sec. 4 of the Telegraphs Act of 1878 these differences were referred to the County Court Judge for him to say whether the consent

TELEGRAPHISTS' CRAMP.

AT the Marylebone County Court, a widow claimed £300 compensation for the death of her daughter, due, it was said, to telegraphists' cramp, set up while employed as a telegraph operator in the Government service. It was contended that the cramp set up sclerosis which affected a central portion of the brain and spread through the nervous system with fatal results. After hearing medical evidence, the judge held that the connection between the sclerosis and cramp was a surmise. He made his award in favour of the respondent, the Postmaster-General.

COAL MINES ACT PROSECUTION.

IN the Hamilton Sheriff Court last week, Sheriff Shennan heard lengthy evidence in two charges of alleged contravention of the Coal Mines Act brought against R. Hutchinson and A. Shaw, firemen. The prosecutions were the sequel to a fatal accident which occurred in the Bardsley Colliery, Blantyre, last August, and the complaint bore that a fall of stones, &c., having taken place, and an unarmoured electric cable having been brought down and covered by the debris, the accused negligently and wilfully asked and allowed several workmen to clear away the fall while the cable was still alive, whereby the lives of the men were endangered, and one of them, McDougall, miner, made contact with the cable and was killed. Witnesses for the Crown deposed that the firemen warned the men to be careful in clearing the fall as the current had not been switched off. On numerous occasions, debris had been cleared from a cable while the current remained on.

MR. WILLIAM SMITH, head electrician to the Summerlee Iron Co., said that the coal-cutter was working at a pressure of 500 volts.

As a matter of practice the current was not switched off when a fall took place. It would impede the work of the pit, if, after a fall, the current was switched off, as electricity was used for ventilation and pumping purposes.

SHERIFF SHENNAN said that as one or two rather important points of law were involved in the prosecutions, he would take time to prepare a written judgment.

HERBERT MORRIS, LTD., v SAXELBY.

THE House of Lords delivered its judgment in this appeal on Monday. The matter has been fully reported in our pages on several occasions. Their Lordships dismissed the firm's appeal.

BUSINESS NOTES.

Consular Notes.—**JAPAN.**—The British Consul, in reporting on the trade of Nagasaki, gives the figures for the machinery import trade during 1914. He shows that though the import from the United Kingdom was less under most headings than in 1913, it was still far ahead of the imports from all other countries combined. The largest part of the import was for the local shipbuilding yard. The totals for the United Kingdom were £101,469 in 1914, and £167,378 in 1913; Germany's total was £21,660 in 1914 and £25,833 in 1913; and the United States share was £7,868 in 1914 and £10,114 in 1913. The following are the figures for some of the different classes:—

	United Kingdom.	Germany.	United States.
Steam boilers	£9,419	—	£148
“ turbines	2,968	1,558	—
Electrical machinery ...	2,946	4,931	1,694
Pumps	3,110	1,493	159
Capstan and other winding machinery	5,784	799	455
Metal or wood-working machinery	21,064	—	1,094

Compared with 1913, the items showing a decrease from the United Kingdom were pumps, cranes, electrical machinery and gas, petroleum and hot air engines. Germany had an increase in electrical machinery, but a decrease in steam boilers and turbines, pumps, metal and wood-working machinery, gas, petroleum and hot air engines. From the United States the decrease was chiefly in electrical machinery.

The Mitsui Bishi Dockyard and Engine Works employed 10,445 workmen at the end of 1914. The Consul says that in mild steel works and plates the United Kingdom makes no effort to compete, but as it is now impossible to obtain these from Belgium or Germany, there may be an increased demand for a better class of steel. The steel foundry at Wakamatsu now produces large quantities of iron plates for dockyard and other use. Work on the construction of an electric tramway system for Nagasaki was to be begun last year. “A portion of about two miles will be first undertaken, and so far as can be learned, the promoters are buying the rails second-hand and the cars are to be made in Japan.”

CHINA.—British Consul General Goffe, in his report on the trade of Mengtzu, says:—“The great drawback to British trade in this province hitherto has been the lack of any British house to represent British manufacturers and push the sale of their goods; but there is a good prospect of this deficiency being remedied in the near future. The present moment is exceptionally favourable for such an enterprise, as the two German firms of Carlowitz and Co. and Speidel & Co., who have hitherto supplied local buyers with machinery, piece-goods, dyes, paper, &c., can now obtain no further supplies, and the Chinese would welcome the establishment of a British house here. There are inquiries for irrigation pumps, electric light machinery, flour and rice mills, the installation of waterworks in Yunnanfu, locomotives and trucks for the Pishih-chai Railway and other items, but they can only be dealt with by a man on the spot who is prepared to make a contract for the goods delivered c.i.f. at Haiphong, to assist possibly to some extent in their erection and to arrange the question of exchange. The representative of the machinery department of a Hong-Kong house is now in the province looking into these matters, and there is a good prospect of at least some of the inquiries resulting in the placing of orders with British manufacturers.”

INDIA.—The American Consul at Karachi, in reporting a request by a firm in that town to be placed in communication with American manufacturers of small engines capable of being driven by electricity, to develop about 5 H.P., and to be as simple as possible in construction, states that this firm, if satisfied, is prepared to push such engines up-country. In India the lower and middle classes do not, as a rule, leave their homes or the districts in which they were born; but the members of enormous “families” live close together in “groups” which combine to buy a machine to grind meal. Sometimes this small mill is run by an oil engine, but recently electricity has made great strides in India and the natives are learning to use it. The local electrical works recently advertised to supply not only electricity for lighting, but also power for mechanical purposes. The firm mentioned above sees a future for small engines run by power furnished by the electrical works.

Several of these engines are, as a matter of fact, in use for the purpose mentioned, and as these machines are not kept in stock, the supply must come from abroad. A complaint is made that on a previous occasion American manufacturers, when advised of the prospective market in Karachi for electrical goods some time ago, “went to sleep” and now an English firm is wiring the town and supplying all the bulbs and other fixtures.

CUBA.—Modern automatic telephone systems, with complete underground cables, are now, states a report by the American Consul at Santiago de Cuba, in operation in that and many other Cuban cities. The old magneto system, formerly in use and very unsatisfactory, has been changed throughout the island. Long-distance service is furnished to nearly all the cities and large sugar mills. The Cuban Telephone Co., an American concern which obtained its concession in 1909, owns and operates practically all the local and long-distance lines in Cuba. New central offices have been constructed in Santiago and the new switchboard now being installed is for 2,000 lines.

ITALY.—There has been, according to an American Consular report on trade in Italy, considerable increase in activity with regard to electrical goods in some districts of that country. At Bari, in recent years an important business has been done in all kinds of electrical appliances, especially motors for industrial and agricultural purposes, electric light and power plants, &c. The greater part thereof was supplied by German firms, who were specially organised for this class of work, having their own branches in Italy. They were thus in a position to furnish complete plants, and if repairs were required their engineers and workmen were near at hand, all of which gave them an unquestionable advantage over their competitors. However, the present war will undoubtedly be the cause of a considerable set-back to German trade in Italy and an interesting field for enterprise will be thus opened to other competitors. In the region of Pisa—a most flourishing industrial section, largely connected with the manufacture of alimentary products, there are more than 200 mills for the grinding of cereals, most of which use water power. The use of small electric motors of 1½ to 3 H.P., is, however, becoming more extensive, and a few of the larger plants have installed motors of 20 to 45 H.P.; but there are more than 300 olive-oil factories where the power used for pressing the olives is still largely hydraulic or animal.

TUNIS.—A recent American Commerce report draws attention to the increasing possibilities of this African market. Tunis is a rapidly growing country of great agricultural and mining resources with a population of about 2,000,000. An increasing market is being developed for all kinds of manufactured goods, and progressive methods are everywhere manifest. Increasing production has brought increasing prosperity, with its demand for a great variety of goods other than farming and mining machinery. The efficient government under the French protectorate has also raised the standard of living of the natives and stimulated their purchases of modern goods. Amongst other things, electrical goods offer a field for future development. There has been a considerable volume of German and Austrian trade, prior to the war, and the latter government has had a commercial museum in Tunis.

SOUTH AMERICA.—Evidence continues to accumulate that the American traders, despite the exceptionally favourable opportunity presented as a result of the temporary withdrawal of many European firms from South American markets as a result of the war, are not carrying all before them in their attempts to capture these valuable markets. The American Consul at Pernambuco, who has been conducting a series of interviews with business men of that city with reference to American trade, corroborates the statements of his colleague at Buenos Ayres, to which reference was made in our issue of January 7th last. Complaint is made of the carelessness of many firms whose indiscretions cause all the trade to pass through the hands of a few firms in New York and thus make it almost impossible for manufacturers and exporters, launching into foreign trade for the first time, to enter these markets, although they are well equipped with managers who know how to deal with the South American importer. These latter firms are not given a fair chance, as the merchants in Pernambuco are, as a result, afraid to deal with unknown firms.

A well-known merchant of that city remarked: “I have seen a great many letters from American firms that wanted to do business in this city, but I never considered them.” When asked why, by the Consul, he replied: “Because your good firms have enough business to attend to at home. Only those that cannot sell their products at home want to find foreign markets.” Several instances which have contributed to this unfavourable impression are quoted. The question of credit is also again referred to as a stumbling block to the increase of American trade. Traders still continue to demand cash against documents in Pernambuco, or even in the United States, before the delivery of goods. “If we have to pay cash,” local merchants say in discussing this question, “we will buy only what we have to, and hope to do business with Europe again after the close of the war. We have a good reason for this. We must do business on credit. Here in Pernambuco most of our business is with the interior and we have to sell to our customers on credit. Another reason is the excessive Customs charges, which would surprise some of the American manufacturers. Then comes the value of the stock itself, so that to pay cash really means working with three capitals—one for the customers, one for the Custom house, and one for the American exporter.” The Consul urges that longer credit should be given and also that more care should be taken in dealing with orders. He even suggests that manufacturers should pass a resolution, promising more careful attention, which could be circulated amongst local traders.

Book Notices.—*Flood Control in California.*—We have received a copy of the report made by the Board of Engineers of Flood Control to the Supervisors of Los Angeles County, relative to an investigation made by this Board, which was appointed in April, 1914, and included the well-known engineers, Messrs. Frank H. Olmsted and J. W. Reagan. The book contains about 500 pages with complete and detailed maps and drawings. This Commission spent 18 months and about one hundred thousand dollars in making surveys and gathering data relative to both the prevention and control of the great floods which every decade visit Los Angeles County. The cost of the works recommended is estimated at more than 16 million dollars. Copies of this report may be secured by professional men, and the authorities of localities having similar flood problems, by addressing the Board of Supervisors of Los Angeles County, Los Angeles, California, or J. W. Reagan, Chief Engineer of Flood Control, Hall of Records, Los Angeles, California.

"Examinations in Science and Technology, 1915." London: Eyre & Spottiswoode. Price 9d.

Staff Supper.—The Supply Department of the BRITISH WESTINGHOUSE ELECTRIC AND MANUFACTURING CO., LTD., held their annual hot-pot supper and smoking concert on January 21st, at the Exchange Hotel, Manchester, when 32 members of the staff and friends sat down to supper. At the smoking concert which followed, Mr. J. Gibson, manager of the department, presided, and he was supported by Mr. G. Ellam (assistant manager). Over 50 were present, including visitors and the department's representatives from Leeds and Sheffield. Mr. Gibson, in giving the toast "The British Westinghouse Co.," referred to the loyal feeling which existed between the company and the staff, and said that during the nine and a-half years he had been with the company, they had treated their staff well, and in return the staff loyally carried out their duties. The department had had a record year, the turnover having increased by nearly 70 per cent. There were many faces missing that night—some, unfortunately, would never be with them again, but he hoped that others who had answered the country's call would be spared to be with them again. Mr. Ellam proposed "Our Visitors," and Mr. L. E. Wilson and Mr. E. E. Prestwich responded. Mr. Bent toasted "The Artists," and Mr. Moon responded.

Private Arrangement.—THE CEDEN ELECTRIC TRACTION CO., LTD., 112, Great Portland Street, London, W.—A conference of the principal creditors was held on January 31st, at the Institute of Chartered Accountants. A statement of affairs prepared by Messrs. J. W. Barratt & Co. showed unsecured liabilities of £7,271, while the assets were estimated to realise £8,302. There had to be deducted £255 for preferential claims and £4,090 due on debentures, and the net assets were reduced to £957. Mr. J. W. Barratt was appointed receiver and manager on January 14th last upon the application of the debenture holders, who were the Austrian Daimler Motor Co., Ltd. The company had carried on numerous contracts, on some of which money had been lost. At the present time they held a Government contract, which it was believed was profitable, and was being continued by the receiver. It was pointed out that in addition to the assets shown on the statement of affairs, there was a large amount due in connection with a sub-contract, and in certain quarters it was thought that a large sum would be realised. There was also the profit which it was expected would be made on the Government contract. There was a large creditor for over £39,000 for money lent, but that amount also was not included in the statement. It appeared that the money was lent by the Disconto Gesellschaft, but there was some doubt as to whether the claim would rank. It was not certain whether the firm named were the actual principals, and it might be that the money came from the Skoda Works, Austria. The company's business was being controlled by a Government supervisor. A petition had been filed for the winding-up of the company. After some discussion it was decided to appoint a Committee of the principal creditors to consider, in conjunction with the company's solicitor, and the receiver, a scheme by which second debentures could be given to a trustee for the benefit of the unsecured creditors. The Committee appointed consisted of the representative of Messrs. Johnson & Phillips, Mr. Hawkins, and Mr. P. Houston (Messrs. Corfield & Crippwell).

Prices Advance.—THE ST. HELENS CABLE AND RUBBER CO., LTD., announce increased prices for rubber-insulated wires and cables consequent upon the continued advance in cost of raw materials.

For Sale.—The Dundee Electricity Supply Department has for disposal one 30-kw. generating set, direct-coupled to 200-250-volt "Parker" D.C. dynamo, complete. See our advertisement pages to-day.

Bankruptcy Proceedings.—C. H. LEIBBRAND, 20, Vesta Road, Brookley, author.—The first meeting of creditors was held on Monday at the London Bankruptcy Court. The receiving order was made on January 26th, on the petition of the Capital and Counties Bank, Ltd., who tendered a proof of debt for £317 in respect of an overdrawn balance at their Felixstowe branch. Mr. F. T. Garton, Official Receiver, reported that the debtor had stated that he was a German by birth, but was de-nationalised in November, 1884, and domiciled in France in 1887-8. He was an author, but had also been engaged in the promotion of companies, though he had never promoted one in his own name. Since 1913 he had been working on a big electrical development scheme at Felixstowe for supplying electricity to East Suffolk. He was the promoter, and had expended at least £3,000 on the scheme, which had been suspended in consequence of the war. He was taken to the Alexandra Palace Detention Camp on November 17th, 1915, without warning, through his not being registered as an alien enemy, although admittedly an ally by right of domicile in France. A previous failure was recorded against the debtor in September, 1902, under which proceedings a dividend of 43d. in the £ was paid, and from which he had been discharged. He attributed his present position entirely to the war, which stopped all his schemes and business. Debtor sent a letter asking for an adjournment with a view to submitting a proposal. The Chairman said that the debtor had not lodged a statement of his affairs. In his preliminary examination he stated that he was only legally liable to the extent of about £600, and he had in the shape of assets, book debts, amounting to £9,000. In the absence of a quorum the meeting was adjourned for a fortnight.

AUGUSTINE GARBUTT, tobaccoist and electrical engineer, Bradford.—At the public examination at Leeds, on February 1st, it was stated that the liabilities were £146 and the assets nil. Debtor attributed his failure to keen competition and losses on contracts. The examination was adjourned until February 15th.

Liquidations.—SCIENTIFIC MANUFACTURES, LTD.—Meeting of creditors, February 14th, at 3, Warwick Court, Gray's Inn, W.C.

ACCUMULATOR INDUSTRIES, LTD.—Creditors should send particulars of debts, &c., to Mr. G. E. Corfield, Balfour House, E.C., or Mr. A. W. Sully, the liquidators, by March 8th.

ADNIL ELECTRIC CO., LTD.—First meeting of creditors and contributors, February 29th, at Carey Street, W.C.

CICOY MAGNETO CO., LTD.—A meeting is called for March 13th, to hear an account of the winding up.

HELESHAW PATENT CLUTCH CO., LTD.—A meeting is called for March 8th, at Hartford Works, Oldham, to hear an account of the winding up.

Inquiries from Italy.—The British Chamber of Commerce for Italy at Genoa sends the following inquiries from firms who formerly did business with Germany and Austria and want to establish British connections:—

No. 956.—Firm at Bari inquire for addresses of British manufacturers of electric material. B.F.R.

No. 969.—Merchant at Turin wishes to get into touch with first-class manufacturer of high-speed steel. T.M.C.

No. 987.—Commission merchant at Genoa is open to represent British firms for mechanical machinery, machine-tools, hydraulic machinery, metals and ores, paints and varnishes, oils. G.M.A.

Trade Announcements.—MESSRS. PARMER, HOPE AND SUGDEN, LTD., have appointed Mr. David Alexander, 43, Mains Street, Waterloo Street, Glasgow, their sole selling agent for Scotland. At that address samples will be shown of all their latest Fluvent switch and fuse gear.

THE INDO-EUROPEAN TELEGRAPH CO., LTD., (Globe Radio Apparatus Department) announce that it has been found more convenient to designate by that title the business of the Wilson Apparatus Co. recently taken over from Mr. H. R. Rivers-Moore. All communications should be addressed accordingly.

Diesel Engine Insurance.—We have received from MESSRS. MIRRELES, BICKERTON & DAY, LTD., of Hazel Grove, near Stockport, a prospectus of a new scheme of insurance of Diesel engines of their make (under arrangement with the London, Guarantee and Accident Co.), which provides for periodical inspection and examination by the firm's own experts. Those interested in the matter should communicate with the firm, asking for a copy.

Patent Restoration.—Application has been made by Nathaniel Baldwin for the restoration of Patent No. 10,774, of 1910, for "Improvements in sound reproducing devices of the telephone receiver type."

An order has been made restoring Patent No. 21,425, of 1911 (R. B. Wasson), for "Improvements in and relating to the manufacture of metal-packing rings."

Meeting of Creditors.—EMPIRE PORTLAND CEMENT CO., LTD.—The committee of creditors, appointed at the general private meeting of creditors, reported last week that a tentative offer had been made to purchase the company, and it was hoped that the sale would produce about 5s. in the £ for the creditors.

Lamp Poster.—THE "Z" ELECTRIC LAMP MANUFACTURING CO., LTD., of Southfields, have brought out a new poster advertising the lasting qualities of their drawn lamps, and a window streamer emphasising that they are made in England.

LIGHTING AND POWER NOTES.

Aberdeen.—NEW PLANT.—The Electricity Committee has approved of an extension of plant at sub-stations, and has authorised the engineer to procure a 500-KW. motor-converter, at a cost of £1,800.

Argentina.—The electrical power house of Messrs. Barone & Hamsa, at Concepcion del Tio (Cordoba) for the supply of public lighting was inaugurated on 1st inst. The service is shortly to be extended to private houses and business premises.—*Review of the River Plate.*

Barnet.—STREET LIGHTING.—The North Metropolitan E.P.S. Co. has allowed the District Council a sum of £66 off the account for public lighting during the past quarter.

Barrow.—PROPOSED LOAN.—The T.C. has decided to apply for sanction to borrow £10,300 for electricity extensions, including transforming plant, cables, switches, &c., required for power purposes, and for supplying light to workmen's dwellings.

Birkenhead.—PROPOSED LOAN.—The provision of H.T. plant and feeders in connection with the supply to the north end of the borough is recommended, at a cost of £6,400.

Birmingham.—PROPOSED REVISION OF CHARGES.—The Electricity Committee is proposing to increase the charges for electricity; it is expected that the Committee will be in a position to make recommendations to the City Council in March.

COAL CONTRACTS.—The City Gas and Electric Supply Committees have decided to pool their coal contracts in future, instead of purchasing independently.

Boness.—The T.C. has instructed Mr. J. M. Munro, of Glasgow, to report on the condition and prospects of the electric supply undertaking, and the need for an immediate extension.

Bredbury and Romiley.—The Stockport T.C. is negotiating with the U.D.C. for consent to current being supplied to Messrs. Pollock & Maenab's works.

Derby.—The T.C. has decided to extend the overhead mains so as to supply current to the works of the Parker Foundry Co.

Dover.—PUBLIC LIGHTING.—Owing to the restricted public lighting, there has been a loss on the capital spent on cables and time switches, and the Electricity Committee has allowed the T.C. credit for this, and to pay £150 a year for the clock switches after March 31st.

Downham Market.—E.L. SCHEME.—Mr. C. H. Best has written to the U.D.C. regarding the offer of the Gas Co. to obtain powers to supply electricity, pointing out that an undesirable monopoly would be created, and that far greater satisfaction would be given by an independent supply company which he proposed to form. The Council has decided to discuss the matter with Mr. Best.

Dublin.—A comprehensive report has been submitted to the Special Investigation Committee of the Corporation by Mr. P. W. d'Alton, M.Inst.C.E., who was appointed by the Committee to inquire into the history and conduct of the electricity supply undertaking of the Corporation. By some means parts of the report were prematurely published in the local Press, and complaints were made at a meeting of the Council that the extracts were so chosen as to give an erroneous impression regarding the trend of the report. We shall deal with the report in our next issue.

Eastbourne.—The Electricity Committee has disclaimed legal liability in regard to the recent fatal collision with a switch pillar; the switchbox was placed in its position in accordance with the B. of T. regulations.

Eccles.—PLANT EXTENSIONS.—The electrical engineer is to report on the cost of providing a plant for three-phase supply, with a view to application being made for borrowing powers to carry out the scheme.

Large users of electricity for lighting purposes are now to be charged a flat rate of 3d. per unit for a consumption exceeding 10,000 units per annum through one service, subject to 10 per cent. increase.

Gillingham (Kent).—The T.C. has decided to increase the charge for current supplied to the Corporation flats from 6d. to 8d. per week. Owing to the difficulty of obtaining supplies of reliable apparatus no more electric cookers are to be issued until a hire-purchase scheme is introduced after the war, and the existing outfits are to be maintained as at present.

Glasgow.—NEW PLANT.—In connection with the placing of contracts for two 8,000-H.P. turbo-alternators, it has been officially pointed out that the Electricity Committee had only maintained the supply by overloading the existing plant. Three large factories, still to be connected, would absorb nearly the whole of the output of one of the turbines, and the other turbine would be required to meet the normal increase at the rate of 2,000 new consumers per annum. The two new sets would effect a saving in fuel equivalent to about £5,000 per annum each, a most desirable form of economy at the present time.

Horsham.—YEAR'S WORKING.—The report of Mr. Morgan, the Council's electrical engineer, shows that despite adverse circumstances, there was a net profit on the electrical undertaking of £420 for the year to March, 1915, as compared with £459 for the previous year. Returns are included of the first complete year's working of the refuse destructor, showing that some 1,422 tons were burnt and 106,690 units generated during 2,458 running hours. The destructor is credited with 320 tons of coal saved and revenue from by-products, totalling £384; financial charges, labour, &c., amounted to £260, leaving a credit balance of £124.

Leek.—The U.D.C. has decided to engage Dr. Watkinson, of Liverpool University, to inspect the electricity works and report. There has been a breakdown of the Diesel engine, the crankshaft of which is cracked, and cannot readily be replaced.

Leigh.—PLANT EXTENSION.—Authority has been given to the electrical engineer to obtain tenders amounting to £18,800 for the supply and erection of additional plant.

Limerick.—The Mayor recently officially started up a new 240-H.P. generating set at the electricity works.

London.—The London Electric Supply Corporation, Ltd., has announced a further 10 per cent. increase in its charges for energy as from March.

HACKNEY.—The E.L. Committee recommends that the charges for electricity be increased by 1½ per cent., as compared with the scale of July, 1914; a 2½ per cent. discount will be allowed for payment within 14 days.

L.C.C.—Sanction is to be given to the borrowing of £13,000 by St. Pancras B.C., and £3,290 by Woolwich B.C. for electricity purposes.

The L.G.B. has been notified of approval of the linking-up schemes of the Woolwich B.C. and South Metropolitan Electric Light and Power Co.; of Marylebone B.C., the Central Electric Supply Co. and the Metropolitan Electric Supply Co.; and of the Hackney and Poplar B.C.'s.

The Metropolitan Asylums Board proposes to enter into a new agreement with the Charing Cross E.S. Co. for supply to the head offices; electric light is also to be installed at the Mead ambulance station.

Owing to the bursting of the compressor of a Diesel engine at the generating station of the Smithfield Market Electric Supply Co. on Monday, one man was so badly injured that he died soon afterwards; the station was only slightly damaged.

Manchester.—MOTOR HIRING, &C.—It is proposed to spend £40,000 on hired motors and additional plant at sub-stations; the revenue obtainable is estimated at £6,400 per annum. It is also proposed to increase hire charges for electric motors by about 20 per cent., representing £1,896 per annum. The increase will date from June 24th next. The Gas Committee has arranged for a supply of electricity to the Bradford Road works, for a period of seven years.

Newmill.—E.L. SCHEME.—The U.D.C. has decided to make inquiries from Holmfirth U.D.C. as to a supply of electricity.

Pembroke (Dublin).—L.G.B. INQUIRY.—An inquiry was held on February 2nd, by Mr. P. C. Cowan, into the Council's application for sanction to borrow £15,000 for electrical extensions.

Perth.—Mr. Lambert, the borough electrical engineer, has reported on the electrical appliances at the gasworks, at which there was a serious breakdown recently, and his suggestions are to be carried out as found convenient.

Queenborough.—PRICE INCREASE.—The Sheerness and District Electric Power Co. has increased the price of current to consumers by 15 per cent. as from January 1st.

Reigate.—PRICE INCREASE.—The T.C. has decided to raise the price of current for heating from 1d. to 1½d. per unit as from April 1st next.

Ripon.—E.L. SCHEME.—A small Committee has been appointed to inquire into the question of the delegation of the electric supply powers to a suitable company.

Rugeley.—PROV. ORDER.—The Gas Co. has informed the U.D.C. that it is in some doubt as to whether the B. of T. will grant it a prov. order for electric lighting.

Salford.—INCREASED CHARGES.—The T.C. has decided to advance the increase in price of electricity for lighting and power from 7½ per cent. previously decided upon to 10 per cent. for lighting and 15 per cent. for power. The new rates are to date from April next.

Sheffield.—MAINS EXTENSIONS.—Mains are to be extended in various parts of the city, at an estimated cost of £4,170, of which £2,150 will be spent in laying mains to the new sub-station in Sidney Street.

Skelton and Brotton.—The U.D.C. has decided to transfer £1,200 from the district account to the electric supply fund to meet the cost of work done outside the contract price for electricity supply.

Southampton.—PLANT EXTENSION.—In view of possible difficulties in steam raising, due to the inferior quality of coal in use, the Electricity Committee has directed its engineer to submit a new scheme for conveying plant, but has deferred the question of new boiler plant, which had been raised, until next September.

Swaffham.—E.L. SCHEME.—The proposal of Mr. C. H. Best, for an E.L. scheme for the town, to be carried out after the war, has been considered by the U.D.C., which is to interview Mr. Best.

Swansea.—ELECTRICITY SHOWROOMS, &c.—The Corporation's new electrical showrooms were officially opened on Friday, last week, by Ald. Sinclair. It is interesting to note that the Mayor was driven to the showrooms in an electric saloon-body car—the first electric car in Wales—placed at his disposal by Messrs. Johnson & Burgess, Ltd. The Electric Lighting and Tramways Committee reports that Lord Jersey has consented to allow an overhead line through his property to the English Crown Spelter Works, on payment of a way-leave of £1 per annum.

Thirsk (Yorks.).—PUBLIC LIGHTING.—The Parish Council has decided to ask the electric lighting contractors for an abatement in respect of the public lighting account, the first instalment (£177) of which is due, on the ground of the restrictions.

Whitstable.—E.L. SCHEME.—The U.D.C. has agreed to the offer of the E.L. Co. to accept 35s. per lamp per annum during the period of the war for public lighting. The money will be retained by the Council for past and future advances in connection with the working of the undertaking.

Wimbledon.—Messrs. Handcock & Dykes have been informed, in reply to their letter disputing their client's (the Fixed Price Light Co.'s) liability for payment for transformer losses, that the question must be settled by arbitration.

The assessment of the South-Western Co.'s new generating station, car sheds, and sidings off Durnford Road, has been reduced to £4,200 gross and £2,800 net value, these figures to remain in force until March 31st, 1917.

Winchester.—The Electricity Committee reports that it may be necessary in the near future to increase the price of current to all consumers.

TRAMWAY and RAILWAY NOTES.

Accrington.—It has been decided to issue through tramway tickets, at existing charges, between Accrington and Blackburn.

Argentina.—The work of electrifying the Argentina Central Railway to the River Tigre has been resumed by the laying of the third rail and power cables.

Barrow.—In view of the curtailed service on Walney Island, the Corporation has agreed to allow the B.E.T. Co. a rebate of £400 per annum, and has also granted the company new licences for running motor-buses on certain conditions.

Dudley.—INQUEST.—The adjourned inquest on the man Evans, killed in the recent tramway accident, was held on Thursday last week. It was admitted that the conductor did not ring the hand bell at starting as required, in order to get a return signal from the driver, and that the latter when he left the car failed to remove the controller handle, as provided in the rules. The jury's verdict imputed gross carelessness to the conductor and censured the driver, and the Coroner committed the conductor for trial at the assizes on a charge of manslaughter.

Gateshead.—TRAMWAY ACCIDENT.—On Saturday evening last a car which was ascending Bensham Bank, and had been brought to a standstill, ran backwards despite attempts to apply the brakes; it subsequently left the rails, overturning at a corner and falling on four pedestrians, who were killed, while many of the passengers were also injured.

At an inquest, held on the 8th inst., on the four persons killed, the jury returned a verdict of "Accidental death," adding that the driver of the car—who left the vehicle in order to assist another driver—committed an error of judgment.

Glasgow.—FEMALE LABOUR.—Success has attended the introduction of women conductors on the Corporation tramway system; already 1,050 women are in charge of cars, while on Sunday 26 women drivers were put on to various routes for the first time. The general manager, Mr. James Dalrymple, is awaiting the approval by the T.C. of women motor drivers before launching a bigger scheme. This course is rendered necessary by so many of the employes having attested under the Derby scheme.

Japan.—According to official statistics, there were at the end of 1913, 914 km. of tramways worked electrically, comprising 1,528 km. of track; there were at that period 413 km. of lines under construction. In 1913 these lines carried 570,000,000 passengers, and the 55 companies which worked them paid dividends amounting to 7.91 per cent. The largest network is the

municipal system at Tokio, totalling 242 km.; the second in order is the electric railway company of Kechan, with 108 km. of lines. —*L'Industrie Electrique.*

Leith.—It is recommended, in view of the increased working expenses, to abolish halfpenny fares, workmen's fares in the middle of the day, and the concessions to sailors and soldiers.

Leyton.—REDUCED ASSESSMENTS.—The West Ham Union has agreed to reduce the rateable value of the tramway undertaking from £5,700 to £5,200, and of the electricity undertaking from £5,700 to £4,200, the reduced assessments to remain during the existence of the adverse conditions occasioned by the war.

London.—During the three months ended December last, the Highways Committee of the L.C.C. has settled 1,134 claims in respect of accidents arising in connection with the tramways, the costs amounting to £10,004. In 14 out of 35 other cases verdicts were given against the Council, and £634 and costs had to be paid.

The Local Government Records and Museum Committee of the L.C.C. recommends that it be authorised to settle outstanding questions between the Council and the Assessment Committees of the various B.C.'s regarding the L.C.C. tramway assessments.

Nelson.—COVERED CARS.—A Sub-Committee of the Corporation has been authorised to meet representatives of the Colne Corporation, to discuss the advisability of providing covers for all cars.

Newcastle-on-Tyne.—REVENUE ESTIMATES, &c.—The tramway estimates for 1916-17 show a gross income of £319,000, as against an expected revenue this year of £324,400; the expenditure is put down at £196,300, as against an expected expenditure this year of £196,175. The gross surplus is estimated at £123,100, and the net surplus at £35,060, but from this is to be deducted £9,600 the cost of allowances to men on active service. This leaves a net profit of £25,460, compared with £33,640 expected this year. During the coming year the estimated expenditure from the reserve and renewals fund is £19,277.

Rotherham.—An offer has been received from the Oldham Corporation to sell a dozen single-deck bogie cars, seating 40 passengers, at £450 each; the Tramways Committee proposes to purchase one, and to ask the Oldham Corporation to keep the offer of the remaining cars open for a period.

Sheffield.—It is proposed to refer the matters in dispute with Rotherham, regarding the running of additional cars to Tinsley, to Mr. Dalrymple as sole arbitrator.

Southampton.—TOP-COVERED CARS.—The tramway manager has reported on the necessity of providing top-covered cars to avoid overcrowding, and suggests that the Bell Punch Co. be allowed a further 6 per cent. increase on its existing ticket contract. For the year to January 7th last traffic receipts showed an increase of £7,250 and weekly mileage an increase of 1,000 miles.

South-Western Railway Electrification.—It is expected that the Hounslow loop-line electric service will be opened on February 27th.

Stretford.—The D.C. has received a letter from the general manager of the Manchester tramways, detailing certain changes, the effect of which will be to give an improved early morning service in Trafford Park, which will be of great service to employees there.

Wigan.—Referring to the effect of the electricity breakdown upon the tramway undertaking, Ald. Fletcher stated at the T.C., on February 2nd, that the estimated net loss on receipts was £1,277, and the net loss, after deducting power expenses and wages saved, was £956.

TELEGRAPH and TELEPHONE NOTES.

Australasia.—The Pacific Cable Board announces that the deferred and week-end cable services between the United Kingdom and Australasia have been resumed, as from the 4th inst.

Italy.—The Consiglio Superiore dei Telefoni has approved of the reorganisation of the urban telephone network of Rome; extensions of the networks at several other towns, and private negotiation for the supply of 1,500 wall instruments, 1,430 kg. of bronze wire, &c.

Paraguay.—The General Electric Co. has applied for a concession to establish a telephone network at Asuncion, the capital city.

Spain.—According to a notice published in Madrid, a company has submitted a scheme to the Government for the establishment of a public service of wireless telephony in Spain, the Balearic and Canary Islands, and the Spanish possessions in the North of Africa. It is also intended to apply the system of radiotelephony to trains in motion and to the railway system in general.

CONTRACTS OPEN and CLOSED.**OPEN.**

Australia.—April 15th. P.M.G. Common-battery multiple switchboard, or automatic or semi-automatic switchboard, and associated apparatus. See "Official Notices" December 31st.

BRISBANE.—April 26th. Deputy P.M.G. Five sections of trunk line switchboard for Toowoomba Exchange. (Schedule No. 342.)

MELBOURNE.—April 12th. Electrically operated runway hoist for the Jolimont car shops. Particulars at the contractors' room, Spencer Street.

SYDNEY.—April 10th. Municipal Council. Supply, laying and maintenance for six months of six 11,000-volt submarine cables, each 400 yards long, across Darling Harbour.*

May 1st. Two 300-kw turbo-alternators, condensers, switchboard, &c., for the pumping station at Ryde, for the Metropolitan Board of Water Supply and Sewerage at Sydney.*

May 3rd. N.S.W. Railways and Tramways Department. One 2,500-kw. turbo-alternator, for Zara Street, Newcastle, power house. Specifications (20s.) from the Engineer's office, 61, Hunter Street, Sydney.*

Bedwas (Mon.).—March 2nd. Electrical goods for the Bedwas Navigation Colliery Co., Ltd. Mr. G. Morgan, Secretary.

Belfast.—February 16th. Corporation. Tramway stores, including cable, lamp and electrical accessories. See "Official Notices" February 4th.

Birkenhead.—March 6th. Corporation. Cable and two rotary converters with switchgear. See "Official Notices" to-day.

Bolton.—March 2nd. Electricity Committee. Twelve months' supply of materials and stores, including some electrical items. See "Official Notices" to-day.

Bradford.—February 14th. B. of G. Maintenance of the electric wiring installation, bells, telephones, &c., at the Union Hospital, Horton Lane. Mr. F. Holland, Architect, 22, Manor Row.

Dewsbury.—Electricity Department. Two second-hand 250-kw. generator panels, oil separator, piping, cables, &c. See "Official Notices" to-day.

Halifax.—February 14th. Corporation. Twelve months' supply of electric lighting fittings and accessories, cables, telephone wire, meters, &c. See "Official Notices" January 21st.

Leigh (Laues.).—February 18th. Electricity Committee. 2,000-kw. turbo-alternator, 6 600 volts; surface condenser, set of pumps, 1,000-kw. rotary or motor-converter, with switchgear. See "Official Notices" January 28th.

London.—ISLINGTON.—February 17th. B. of G. Alteration to wiring, provision of switchboards, motor starters, motors, &c. See "Official Notices" January 28th.

HAMMERSMITH.—February 16th. Corporation. Stores for the Electricity Department. See "Official Notices" February 4th.

BATTERSEA.—February 21st. B.C. Stores for the Electricity Department. See "Official Notices" February 4th.

L.C.C.—The Highways Committee is to invite tenders for tramway fittings, equipment, &c., for 1916-17.

FINSBURY.—February 14th. B.C. Six or 12 months' supply of electric lamps. Borough Surveyor, Town Hall.

METROPOLITAN WATER BOARD.—March 7th. Electric lamps, wire, and accessories. Chief Engineer, Savoy Court, Strand, W.C.

ST. MARYLEBONE. February 23rd. B.C. Cables, insulating material, &c.

Macclesfield.—March 15th. Guardians of the Cheshire County Asylum. Electrical goods. Mr. W. G. F. Tingay, Clerk of Asylum.

Manchester.—February 15th. Corporation. Stores for the Tramways Department. See "Official Notices" January 28th.

New Zealand.—DUNEDIN.—May 17th. City Council. (1) Tramcar bodies; (2) electrical equipment. Plans, &c., from the Town Clerk, Dunedin.*

Portsmouth.—February 15th. Corporation. Six months' supply of tramway stores, including insulating materials, lamps, motor windings. See "Official Notices" February 4th.

Salford.—February 21st. Tramways Committee. General stores. General Manager, 32, Blackfriars Street.

Southampton.—February 19th. Corporation. Stores for the Tramways Department.

Stockton-on-Tees.—February 15th. Electricity Committee. Stores.

Todmorden.—February 12th. Electricity Committee. One Lancashire boiler, superheaters, mechanical stokers, pipework, centrifugal pump. See "Official Notices" February 4th.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Accrington.—Electricity Committee. Altham Colliery Co., for a weekly supply of 70 tons of coal, at 18s. 3d. per ton, delivered, and from March until the winter months, for 30 tons per week extra, for storing, at 16s. 11d. per ton; the Corporation to cart the latter.

Batley.—The E.L. and Tramways Committee. B.I. and Helsby Cables, Ltd. Cable.

Bristol.—The Corporation Docks Committee has accepted the following tenders:—
W. T. Henley & P. W. Co., and Callender's Cable Co.—Cable, Simplex Conduits, Conduit and fittings.
Dormann & Smith, Ltd.—Incandescent lamps, fittings, &c.

Dover.—T.C. McIntosh Cable Co., cable, £3,395, for extensions.

Glasgow.—The Clyde Navigation Trustees have accepted the offer by Messrs. Crompton & Co., Ltd., for electrical spares for 32-ton cranes at Queen's Dock and Rothesay Dock.

London.—HACKNEY.—The Electricity Committee recommends that, owing to the increase in the price of materials, the contract with the B.I. & Helsby Cables, Ltd., for armoured cables, be varied according to a submitted schedule.

BATTERSEA.—The Electricity Committee recommends that the contract with Callender's Cable Co., for cables, be renewed for one year from April 1st next, on specified terms and conditions.

L.C.C.—The Highways Committee has accepted the tenders of the Morgan Crucible Co. for carbon brushes, at £14 10s. per 1,000, items 1 and 2 Class T (tramway equipment, &c., 1915-16), and Le Carbone, for carbon brushes, item 3, at £13 10s. per 1,000.

The contract with Hadfields, Ltd., for special trackwork in connection with the tramways, is to be extended for one year from July, 1916, and thereafter until determined, by 12 months' notice, the prices to be revised every three months.

The Committee purchased 28,241 tons of coals for Greenwich generating station, for £36,755, during the last quarter of 1915.

Manchester.—Electricity Committee.

Bertram Thomas.—One low-tension switchboard.

Johnson & Phillips, Ltd.—Low-tension cable.

British Westinghouse Co.—Four 1,650/1,320 kw. rotary converters for sub-stations.

Bruce Peebles.—Two 1,050-kw. motor converters and two 300-kw. positive traction boosters for sub-stations.

Mirless Wals n Co., Ltd.—Alterations, &c., to condensing plants.

Atton & Co.—Pipework.

J. Hopkinson & Co., Ltd.—Valves.

B.I. & Helsby Cables, Ltd.—Cable.

Preston.—The Corporation has placed a contract for meters for the year with Messrs. Chamberlain & Hookham, Ltd.

Shanghai.—The General Electric Co. of China, Ltd. Shanghai, have for the sixth time secured the yearly contract for the supply of Oram traction type lamps to the Shanghai tramways.

Sheffield.—Tenders accepted by the Electric Supply Committee:—

C. A. Parsons & Co.—Turbo-alternator (duplicate of the one now on order), £37,625.

Stirling Boiler Co.—Three boilers and accessories, £34,400.

E. Taylor, Ltd.—Extending condensing water service, &c., at Necpsend, £8,660.

A. Reyrolle & Co.—Six-panel ironclad H.T. two-phase switchboard, £646.

J. E. Nadin.—Levelling coal storage site and laying steam crane track, £3,802.

NOTICE TO OUR READERS.

THE Government has intimated its intention to reduce the supply of paper available for newspaper and other publications. The reduction will be such as to render economy in consumption imperatively necessary. The situation will have to be met in various ways, and in order to assist us in complying with the demands of the Government and to prevent disappointment due to inability to obtain copies, we shall be glad if readers of the ELECTRICAL REVIEW will give a definite standing order to their usual newsagent or bookstall. This applies to all readers who do not receive their REVIEW direct from these offices.

FORTHCOMING EVENTS.

Physical Society of London.—Friday, February 11th. At 4 p.m. At the Imperial College of Science, South Kensington, S.W. Papers: "On a General Method for Comparing the Mutual Inductances between Two Coils with the Self-inductance of One of Them," by Prof. C. H. Lees, F.R.S., and "An Enclosed Cadmium-Vapour Arc Lamp," by Mr. H. J. S. Sand.

Manchester Association of Engineers.—Saturday, February 12th. At the Grand Hotel, Astoria Street. Paper on "Oil Engines," by Mr. G. E. Windeler.

North of England Institute of Mining and Mechanical Engineers.—Saturday, February 12th. At 2 p.m. At Neville Hall, Newcastle-on-Tyne. General meeting.

Electro-Harmonic.—Monday, February 14th. At 6.15 p.m. At Holborn Restaurant. Ladies' Night. See our "Notes" to-day.

Society of Chemical Industry (Newcastle Section). Wednesday, February 16th. At the Wood Memorial Hall, Newcastle-on-Tyne. At 8 p.m. Lecture on "The Problems of Coal with reference to the Complete and Proper Utilisation of Our Fuel Supplies," by Prof. H. E. Armstrong F.R.S.

Chemical Society.—Thursday, February 17th. At 8.30 p.m. At Burlington House, Piccadilly. Ordinary Scientific Meeting.

Belfast Association of Engineers. Thursday, February 17th. Paper on "Torque Plant," by Mr. P. J. Plevin.

Institution of Electrical Engineers.—Thursday, February 17th. At 8 p.m. At Victoria Embankment. Seventh Kelvin Lecture, on "Terrestrial Magnetism," by Dr. C. Chree, F.R.S.

Students' Section.—Wednesday, February 16th. At 7.45 p.m. At Victoria Embankment. Paper on "The X-Ray Tube and Modern Practice," by Mr. W. J. Jones.

Institution of Mechanical Engineers.—Friday, February 18th. At 6 p.m. At St. George Street, Westminster, S.W. Annual General Meeting.

Greenock Electrical Society.—Friday, February 18th. At 7.45 p.m. At the Temperance Institute, 14, West Stewart Street. Paper on "Electro-Plating," by Mr. S. V. Tharp.

Royal Institution of Great Britain.—Friday, February 18th. At 5.30 p.m. At Albemarle Street, Piccadilly, W. Lecture on "Polarised Light and its Applications to Engineering," by Prof. E. G. Coker.

NOTES.

Foreign Trade.—THE JANUARY FIGURES.—The following are the electrical and machinery figures given in the official returns for January:—

IMPORTS.			
Electrical goods and apparatus, excluding machinery and insulated wire	Month of January.	Inc. or dec.	
...	£118,902	+ £62,037	
Machinery	700,718	+ 82,311	
EXPORTS.			
Electrical goods and apparatus, excluding machinery and insulated wire	279,933	+ 10,040	
Machinery	1,480,131	- 183,351	

Tests on High-head Water-Wheels.—In the *Electrical World* of January 8th were given the results of tests on water turbines installed in the Tallulah Falls Station of the Georgia Railway and Power Co., in 1913. These sets were intended for a normal rating of 16,000 H.P. at 580 ft. effective head, when driving 10,000-kw. generators at 514 R.P.M., but as it was found that the generators could carry 12,000 kw. continuously at 80 per cent. power factor, the output of the turbines was raised to 18,000 H.P. Five sets are in place, with room for a sixth; they

POWER AND EFFICIENCY CURVE OF 12,000-KW. WATER TURBO-GENERATOR.

are of the vertical-shaft Francis type, with bronze runners and forged steel gates, and weigh 300,000 lb each. The working head is 606 ft., the highest head at which turbines are working in the United States. Three sets were tested individually, at 80 per cent. of their maximum output, the efficiencies recorded being 88.3, 89.3 and 89.5 per cent. The highest efficiencies were respectively 89.3, 90.4 and 89.5 per cent., at three-quarter gate opening and about 16,900 H.P. The electrical output was absorbed by water rheostats at 63,500 volts. The accompanying curve shows the output and efficiency of No. 3 set, which gave the best results.

Proposed Standard Numerals.—In the *Journal* of the INSTITUTION OF ELECTRICAL ENGINEERS for February 1st a note by Mr. A. P. Trotter describing a set of proposed standard numerals for the scale of measuring instruments was published. After examining the numerals used on a large number of measuring instruments, including electricity meters, surveyors' staffs, and the Admiralty standard scales, the author designed the set in 1908 with the sole view of legibility (fig. 1); elegance of shape was not disregarded altogether, but wherever necessary it was sacrificed to legibility. Except, perhaps, in the case of the 1, there should be no serifs, and the figures should be of the block character—that is to say, there should be no marked difference in the thickness of

FIG. 1.—NUMERALS DESIGNED BY A. P. TROTTER, MINIMUM THICKNESS.

FIG. 2.—TROTTER NUMERALS, VARIOUS THICKNESSES.

the line in any part of the figure. The relations between the 3, the 6, and the 8, and between the 6, or the 9, and 0 were considered with the object of preventing confusion. A height of 10 units and a width of 7 is recommended. The thickness of the line should not be less than one-twentieth of the height of the figure—that is, half a unit—not thicker than 1½ units. In fig. 1 the minimum width of half a unit has been adopted; fig. 2 shows thicknesses of 1, 1½, and 1½ units. To avoid confusion with 5, as well as with 8, Mr. Trotter strongly recommends the flat-topped 3. According to the usual practice, the 9 is simply the 6 reversed.

Industrial Banks.—Speaking at the annual meeting of Lloyds Bank, Mr. J. W. Beaumont Pease, deputy chairman, according to the *Times*, dealt with the criticism recently directed against English banking practice as compared with German. He laid down the proposition that, unless the interests of a bank were subordinated to the interests of the depositors, it was being run on unsound lines. Strictly no portion of a banker's deposits should be locked up in securities not easily realisable. In practice the exigencies of business involved a certain amount being so invested, but the aim of the banks was always to be prepared for the demands that their depositors might make upon them. It was not quite the same thing as regarded share capital, for that was an investment of a shareholder who had no right to demand his money back. A banker could not be blamed if he dealt with the capital in a more permanent form, German banks had comparatively a much greater proportion of capital than English banks, and they were, therefore, enabled to make much longer loans and less liquid investments. If that were an advantage to trade it might be worth while to consider what could be done by English finance in this direction, not through a bank dealing with depositors' money, but through a financial institution with a large capital which could undertake investments of the kind. He, however, could not help thinking that danger and harm rather than good might accrue to the trade of the country as a whole if banks became identified with particular companies or enterprises. It would tend in the direction of big trusts and monopolies. Time would shortly show whether the German banks had been secured on such sound foundations as our own.

Fatality.—NEWCASTLE-ON-TYNE.—An inquiry was held on the 3rd inst. into the death of S. J. Thomas, an electrician, which occurred at the Elswick works of Armstrong, Whitworth & Co. Deceased's brother, a foreman electric tester, stated that on 1st inst. he and his brother went into the casting department to test a fan motor. Close to the switch was a way by which coke was conveyed to the furnaces, and when the vehicles containing the coke were passing, the clearance was less than two feet. Deceased went straight to the switchboard, and witness heard a shout, and saw his brother leaning face forward against the switch. Artificial respiration was tried unavailingly. On examining the switchboard witness found that a joint in the wire leading to the meter had been bared. Deceased was an experienced man, and it was most unlikely that he would start to bare the joint while it was alive. He thought his brother would have opened the switch before touching the wire, and then taken the tape off the joint, but that in avoiding the coke conveyor he had accidentally pushed the switch in, while he still had hold of the wire, and thus had received the fatal shock. A verdict of "Accidental death" was returned.

Federation of Engineering Labour.—A scheme for closer unity among the organisations forming the Engineering and Shipbuilding Trades Federation has now been approved by the majority of these societies. The scheme does not include amalgamation, but its object is to federate the unions so closely that they will act as one body in all matters of wages and conditions. Amongst the societies whose members have already accepted the scheme by an overwhelming majority are the Amalgamated Society of Engineers, the United Patternmakers' Society, the Electrical Trades Union, and the Gasworkers and General Labourers' Society.—*Standard*.

Radiograph Ambulance Cars.—At a recent meeting in aid of the Radiograph Ambulance Cars Fund, Sir James Mackenzie Davidson said the value of X-ray motor ambulances at the fighting fronts was beyond all question, and the promoters of this fund were conferring a great practical benefit upon the wounded in the war.

Italian Hydro-Electric Works.—A decided awakening has been brought about in Italy directly and indirectly through the war, both privately and in Government circles. The campaign instituted by Signor Conti in favour of the development of the hydro-electric works has now been followed by the inauguration of propaganda by the Italian Electro-technical Association, with a view to the advancement of the production of native machinery and apparatus, and by the issue of two Government decrees which were published, and came into operation on January 18th. Both decrees aim at the securing of some relief from the extremely unfortunate coal crisis which prevails in the country owing to the comparative scarcity of the tonnage arriving from abroad, and the very high prices to which steam coal and house coal have risen when actually delivered in the country, in consequence of the enormous advance in the rates of freight. In the first decree, it is ordained from the present until further notice that the public lighting must be reduced by one-half in all towns where the supply is effected either with gas (exclusive of acetylene) or with oil or with electrical energy produced by the use of steam or gas or oil engines, or where these systems are used in combination. When the public lighting is carried out partly as mentioned, and partly by means of energy furnished by hydro-electric works, the reduction must be effected by decreasing or by entirely suppressing the service afforded by the former systems. In the case of public lighting, which is wholly supplied from hydro-electric works, the prefect of the province can enforce a reduction to one-half in order that the energy thereby rendered available may be utilised also beyond the towns or province, so as to decrease or suppress the employment of the before-mentioned systems or be utilised for heating, motive power or other industrial purposes beyond the towns or the province. The decree also empowers the town councils to curtail the number of public electric lamps and hours of lighting per day, and during the hours when the public lighting is completely suspended, it will be possible for the councils in agreement with the prefect also to stop electric lighting by private consumers.

The second decree seeks to obtain a more rapid increase in the production of electrical energy by the existing hydro-electric works. It is considered to be urgent to promote the national economy in this direction, which is seriously threatened by the augmentation in the prices of coal. As a consequence, and on the proposal of the Ministry of Finance, and in agreement with the Minister of Public Works and Agriculture and Industry, it has been arranged that concessions can be granted by the Ministry of Finance, without the formality of inquiry, for securing an increase in the water taken from the public watercourses by means of modifications in the present methods of taking off the supplies, excepting when the rights of third parties are concerned. Naturally the decree is merely a temporary expedient, but further developments appear to be in early prospect, with the object of securing substitutes for coal, as has been suggested to the Government. One of these which is now engaging the attention of the Government relates to the introduction of a measure which would be less complicated in the formalities to be complied with by those seeking the grant of concessions for the utilisation of water powers for the production of electrical energy, and there is little doubt that the industrial awakening now in progress will lead to an improvement in this respect and strengthen the hands of those members of Parliament who have been enlightened on the matter by the programme initiated by Signor Conti a few weeks ago.

National Illumination Committee of Great Britain.

—The report of the chairman (Mr. W. Duddell), presented at the special annual meeting of the Committee, on January 27th, states that during the year 1915 a great part of the international work which was contemplated has been wholly suspended. Mr. Trotter's proposal that the height of the amyl-acetate flame which afforded the light of one standard candle should be determined, was adopted, and reports were received from Dr. Houstoun and Profs. Mather, Marchant and Morris. A paper by Dr. Ott, of Zurich, on the "Effect of Variations in Atmospheric Conditions on the Light of the Hefner Lamp," was received, and was published in the technical Press.

Institution and Lecture Notes.—**Institution of Electrical Engineers.**—As soon as the approval of the Board of Trade is obtained, the Council proposes to call a special general meeting of the corporate members to consider and, if approved, to adopt the following addition to the articles of association:—

Addition to Article 41.—“(a) In the event of a state of war arising between Great Britain and any other country or State, any member of any class who at any time during such war shall be a subject of such enemy country or State shall forthwith cease to be a member of the Institution, and in the case of the European War of 1914 all such members shall cease to be members of the Institution on and after (The date to be inserted will depend on the date of confirming the resolution.)

The Council has also received a petition signed by 17 corporate members with regard to the expulsion of enemy aliens, asking that in accordance with Article 80, the Council shall call a special general meeting for the purpose of dealing with the matter. It is understood that the signatories are of opinion that the alteration proposed by the Council will effect the object of the petition.

At a meeting of the WESTERN LOCAL SECTION on Monday, at the South Wales Institute, Cardiff, a paper was read by Mr. O. L. Record on "The Testing of Underground Cables with Continuous Currents." The essence of the paper was the description of the Delon Special Testing Apparatus for testing with direct current, the

principal advantages of which are that high pressure tests can be carried out without damage to the cable, and that the necessity for transporting cumbersome apparatus in case of alternating current is obviated, the Delon D.C. apparatus being capable of transportation in a suitable handcart. Mr. W. A. Chamen, Mr. Tremain, Mr. C. F. Proctor, and Mr. C. T. Allen asked questions on various points of detail, and expressed high appreciation of the paper. Subsequently the members sat down to an informal dinner at the Park Hotel.

At a meeting of the SCOTTISH LOCAL SECTION in Edinburgh, on Tuesday evening, Mr. H. H. Harrison's paper on "The Principles of Modern Printing Telegraphy" was read and discussed.

At the meeting of the YORKSHIRE LOCAL SECTION on Wednesday last, the paper was read by Mr. O. L. Record, on "The Testing of Underground Cables with Continuous Current," and a discussion followed.

Society of Engineers (Inc.).—At the meeting of the Society on February 7th, the President's Gold Medal was presented to Mr. Arthur H. Barker, B.A., B.Sc., for his paper on "Future Developments in Heating and Ventilation," and the Bessemer Premium, value £5 5s., to Alphonse Steiger, for his paper on "The Modern Development of Water Power." Mr. Percy Griffith, M.Inst.C.E., President for the year 1916, then delivered his Presidential address in which, after some preliminary remarks, he discussed the status of the engineering profession. He considered that it was necessary to educate the public as to the functions, qualifications, rules of conduct and basis for remuneration of the various classes of engineers, and advocated the establishment of a new organisation, having as its main objective the consideration and settlement of problems common to the whole profession.

Junior Institution of Engineers.—In the immediate future the Society's programme includes lectures on "Chemistry and Engineering," by Prof. H. E. Armstrong; "The Use of Alternating Currents in Factories," by Mr. G. H. Ayres; and on "Electricity in Factories," by Mr. R. Rankin. On February 26th, at the King's Hall, Holborn Restaurant, the Institution has arranged to hold a Bohemian Concert in aid of the British Red Cross Society in general, and the City of London Red Cross Hospital in particular. Sir Boverton Redwood, Past-President, will preside, and will be supported by the Right Hon. the Lord Mayor of London.

Royal Society of Arts.—On Wednesday, Prof. J. A. Fleming read a paper on "The Organisation of Scientific Research in this Country," dealing with the subject under the heads of "Methods, Means, and Men."

Royal Institution.—In the course of his lecture last week on the industrial application of gaseous fuels derived from coal, Prof. W. A. Bone urged that in order to achieve the economies in respect of power production which were possible, existing inefficient plant must be scrapped and the distribution of electrical energy reorganised on the large scale as it had been on Tyneside.

Croydon Wireless Society.—On Saturday last Dr. Anseley Eccles gave a lecture on the detection and localisation of foreign bodies by means of X-rays.

Two Interesting Problems.—We have received solutions of the metal-sided cube problem from Messrs. E. Redman and H. W. Underhill, the former making the diagonal resistance $\frac{1}{2}$ ohm and the latter 0.68 ohm. We are not satisfied, however, that either is correct, owing to the ambiguity of the question, which does not state clearly between what limits the side of the cube has a resistance of 1 ohm. The only rational way in which to deal with it, in our opinion, is to regard the side as having 1 ohm resistance between opposite edges when the current is led in and out uniformly along the whole width of the plate. If the current enters at a point the question of its distribution immediately arises; the resistance of the plate will then depend upon the position of each point. So long as the stream lines are straight and parallel, the resistance of a sheet of metal is a definite quantity, but when the stream lines are curved the problem becomes difficult. The *Wireless World*, in giving the solution to the magnet problem, adds a note: "Next month Dr. Fleming on the cube resistance problem," which points to the same conclusion; we shall await Dr. Fleming's views with interest.

Electro-Harmonic Society.—The next Concert (Ladies' Night) will be held at the Holborn Restaurant (King's Hall) on Monday evening, February 14th, commencing at 6.15 p.m. Morning dress. Sir William Slingo will preside. The artistes will be as follows:—Miss Olive Sturges, soprano; Miss Norah Blaney, songs at the piano; Mr. Tom Kinniburgh, baritone; Miss Ivy Angove, violin; Mr. W. V. Robinson, Canadian entertainer; Mr. Nelson Jackson, selections from his repertoire. Mr. Bernard Flanders, A.R.A.M., solo pianoforte and accompanist.

Electricity Supply Engineers and an Enemy Black List.—It is stated that the Association of Municipal Electrical Engineers is asking the Government to instruct the Board of Trade to issue an authoritative list of alien enemy manufacturing firms now operating in Great Britain, in order that the members may, as far as possible, avoid the purchase of enemy manufactures.

The Australian Trade Commissioner.—Mr. G. T. Milne, H.M. Trade Commissioner for Australia, will arrive in this country on an official visit about the middle of March. Those desirous of interviewing him should apply early to the Director, Commercial Intelligence Branch, Board of Trade, London, E.C.

Speed and Mileage Ratings of Electrical Vehicles.

At a meeting of the American Society of Automobile Engineers recently held in New York, the following recommendations of the Electric Vehicle Division with regard to standard ratings in connection with the mileage and speed of electrical motor vehicles were adopted:—"Electric vehicle speed ratings shall be based on continuous operation with one-half load over hard, smooth and level roads or pavements at the actual average battery charge." "Electric vehicle mileage ratings shall be based on a continuous run at the S.A.E. rated speed with one-half load over hard, smooth and level roads or pavements."

Volunteer Notes.—ENGINEERING INSTITUTIONS' VOLUNTEER ENGINEER CORPS.—Orders for week commencing February 14th, 1916.—By Lieut.-Col. C. B. Clay, V.D., Commandant.

Drills, 6.25 to 7.25; 7.25 to 8.25 p.m.

Monday, February 14th.—Sections 1 and 2, Technical; Sections 3 and 4, Lashings and Trestle Bridging, Signalling Class and Recruits.

Tuesday, February 15th.—School of Arms, 6 to 7 p.m.

Thursday, February 17th.—Shooting for Sections 3 and 4.

Friday, February 18th.—Sections 3 and 4, Technical; Sections 1 and 2, Lashings and Trestle Bridging; Signalling Class and Recruits.

Saturday, February 19th.—Adjutant's Instruction Class at 2.30 p.m.

E. G. FLEMING,
Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON REGIMENT (VOLUNTEERS).—Battalion Orders by Colonel S. G. Grant (Officer Commanding), Thursday, February 10th, 1916:—

Week-end Parades.—**Saturday.**—The Battalion, less Platoons Nos. 10, 15 North London and 11, will parade at Wembley Park at 3.15 p.m. for drill under Company Officers. "Derby" recruits are invited to attend.

Sunday.—The Battalion will parade, as strong as possible, at 9.40 a.m., outside the entrance to Euston Station (L. & N.W.R.), Euston Road, for Divine Service. Dress—Uniform, with side-arms only. Overcoats will not be carried.

After the Church Service the Parade will be inspected by the Lord Mayor.

Musketry.—The Inter-Platoon Competition will be continued on Saturday, the 12th inst. when the semi-final round will be completed. The competing platoons Nos. 10 and 15, North London and 11, to attend at the Acton Range at 1.30 p.m.

A. G. JOINER, Major and Adjutant, O.B.C.

Artists' Rifles, O.T.C.—One remarkable effect of the Earl of Derby's Recruiting Scheme has been that a large number of professional men from the technical trades, including architects, engineers and surveyors, having realised that they must no longer delay offering their services to the country, have applied to the Artists' Rifles, O.T.C., for direct enlistment. Moreover, of those who have attested under the scheme, many have felt impatience for their Groups to be called up, and, solving the problem for themselves, have applied for, and obtained, transfer from Army Reserve B, in which Derby recruits are placed, to some Regular or Territorial unit. This course is particularly favoured by men whose education and social position render them eligible for commissions. The transfer of men who have been placed in Army Reserve B may be effected as soon as possible after they have been approved and found medically fit, or postponed until a later date, provided that at such later date the requirements of the Service require the transfer. The Corps has a special class for training members who desire to obtain commissions in the Royal Engineers and Pioneer Battalions, and for testing candidates for such commissions.

Appointments Vacant.—Power house staff for the Southern Command, Salisbury; shift engineer for Reigate. See our advertisement pages to-day.

Submarine Power Cables.—Two 11,000-volt submarine power cables have recently been laid across the Golden Gate at San Francisco, for the extension in that city of the Pacific Gas and Electric Co.'s distributing system. The cables, which are about 12,000 ft. long, were laid under unusual difficulties, incident to swift current and deep water, as well as to dangers in the heavy fogs, from the shipping that plies in and out continuously through the entrance to the harbour. However, the work was completed on schedule time, and the cables successfully passed the 22,000-volt test to which they were subjected immediately after the work was done.—*Electrical World.*

Inquiries.—A correspondent who is erecting an overhead traveller on cast-iron columns 11 ft. high x 5 in. diameter, 3 in. thick, proposes to fill the columns with fine concrete, and inquires whether it would be advisable to reinforce the concrete inside with 3 in. iron rods; also, whether there would be any trouble through expansion of the concrete.

A correspondent asks for the address of the maker of "Castle No. 5" accumulators.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—The Skelton and Brotton U.C. has appointed Mr. G. Dixon, engineer of the Council's electricity supply undertaking at a salary of £177 per annum. Mr. Dixon to be allowed to continue his appointment as engineer for the Cleveland and Durham Electric Power Co. in East Cleveland.

The Melbourne City Council has increased the salary of Mr. H. R. HARPER, city electrical engineer, from £1,000 to £1,250 per annum.

General.—Mr. W. ECKLORD, electrical engineer for the Wingate, Wheatley Hill, and Thornley Collieries Co., Durham, has been presented by the officials with a marble time-piece, on the occasion of his leaving to take up similar duties under the South Moor Coal Co.

COUNCILLOR J. J. O'NEILL has been re-elected chairman of the Dublin Electricity Committee, and Councillor C. McGRINNESS has been elected vice-chairman.

The marriage of Mr. H. P. PARSHALL to Miss Ellen Dunlop Payne, of Boston, U.S.A., was solemnized at Penn. Bucks., on January 31st.

The *London Gazette* announces that Mr. J. S. PRINGLE has been appointed an electrical engineer in H.M. Naval Establishment.

Mr. S. A. JEVONS, chief clerk at the Stockton-on-Tees Corporation electricity works, has passed the Intermediate Examination of the Chartered Institute of Secretaries at Manchester University.

Roll of Honour.—Captain (temporary Major) A. E. E. PAWCELS, of the 7th Battalion Manchester Regiment, who has won the Military Cross, was an electrical engineer, and, with his father, was interested in estate development in East Africa.

Private HARRY HAUGHTON, of the 9th Battalion King's Own Royal Lancasters, formerly in the employ of Messrs. Mather and Platt, is reported a prisoner of war in Bulgaria.

Sapper WALTER FOX, of the Royal Engineers, who has just been gazetted a Second-Lieutenant, was, up to two years ago, employed at the Stalybridge Joint Board's generating station, and subsequently went to an appointment at Singapore.

Private J. McCABE, of the King's Own Scottish Borderers, prior to the war employed at the British Westinghouse Works, Trafford Park, has been killed in action.

Private W. HOPE, of the 20th Hussars, reported wounded, was, prior to the war, on the electrical staff at the collieries of Messrs. Fletcher, Burrows & Co., Atherton.

Colonel BRIGHTON, chairman of the Jackson Electric Stove Co., Ltd., was mentioned in dispatches with reference to fighting in the Gallipoli Peninsula. He has since received the Most Distinguished Order of St. Michael and St. George.

Private O. N. SOPER, of the 5th Buffs (East Kent Regiment), who has been wounded in action in Mesopotamia, was on the electricity staff at the S.E. Railway works at Ashford (Kent) before the war. Private A. L. BAKER, of the 5th Buffs (East Kent Regiment), killed in action in Mesopotamia, was engaged in the electricity department at the same works.

Private WM. T. PLAYFORD, of the 8th Buffs (East Kent Regiment), who was, until the war, on the staff of the Isle of Thanet Electric Tramways Co., has been wounded in action in France.

Sergeant HERBERT NEELE, of the 7th Norfolk Regiment, late of the staff of the Bradford City tramways department, has been killed in action in France.

Lance-Sergeant J. F. GELL, of the 3rd Company, 18th Battalion King's Liverpool Regiment, who has been killed by shell fire in France, was, before the war, on the staff of the electricity department of Wallasey Corporation.

The D.C.M. has been awarded to Regimental Sergeant-Major BAX TIER, of the South Lancs. Regiment, who was, prior to the war, engaged at Manchester with the British Westinghouse Electric & Manufacturing Co., Ltd.

Corporal T. FRANKS, of the 2nd East Lancs. Field Ambulance, Royal Army Medical Corps, who was engaged at the Bury (Lancs.) Corporation electricity works, has been awarded the D.C.M. for gallantry at the Front.

Obituary. Mr. HERBERT KINGSTON, The death occurred on February 5th, in his 59th year, of Mr. Herbert Kingford, of Lima, Peru, engineer to the Central and South American Telegraph Co.

Will.—The late Mr. H. A. TAYLOR (Clarke, Forde & Taylor) left £42,520.

REVIEWS.

Specification and Design of Dynamo-Electric Machinery. By M. WALKER. London: Longmans, Green & Co. Price 32s. net.

The author of this book says that a serious apology is needed for adding another book on the design of dynamos to our already overcrowded shelves, but as there appeared to be no book of electrical precedents analogous to the famous "Conveyancing Precedents," compiled by Pridaue, it occurred to the author that such a book would be of some use to those engineers who from time to time have to draw up specifications for the purchase of electrical machinery. We are glad that such an idea did so occur to him. The book not only deals with specifications for electrical machinery, but also outlines a method by which the specifications may be complied with by manufacturers.

The book is divided into two parts. In Part I rules for use in the design of dynamo-electric machinery are discussed, while in Part II the specification and the design to meet the specification are treated of.

Chapter I is introductory, and points out certain well-known facts in a refreshing manner.

The magnetic circuit is dealt with in Chapter 2. The effect of the number of poles on the general design is well discussed, and we are glad to see that attention is drawn to the fact that revolutions per minute have a superior limit as far as reducing material goes. For example, the material for a 4-pole 25-cycle machine running at 750 revolutions per minute is rather less than for a 2-pole machine running at twice the speed. Of course, special reasons may demand the higher speed in spite of this fact. Certain neat methods for determining field forms for salient and distributed windings are given.

In Chapter 3 the electromotive force coefficient is considered in detail, and a short précis of important papers is given.

The vital subject of materials of the magnetic circuit is then discussed. The author very rightly employs throughout the book, in the main, the metric system of units. As he says, this will be the system which will probably be most generally employed in the future. The reviewer and, in fact, all the practical designers he is acquainted with, use this system, and then, where necessary, convert their millimetres into inches for the benefit of the British workman. Most designers at some time or other have known two continuous-current motors, that have been wound to the same specification, to run on test at appreciably different speeds. This kind of thing is well accounted for on page 37, where the reasons for considerably different magnetic properties of cast iron from two different pourings from the same ladle are dealt with. A number of prices are given for different kinds of material. These are quite of the right order at normal times. Iron losses are also discussed in a clear and practical manner.

Chapter 5 deals with the different parts of the magnetic circuit, such as shapes of slots and teeth, flux distribution behind teeth, and so on.

The electric circuit is next considered. A very large number of winding diagrams are given, all being for alternating-current generators and motors. The windings are all printed in one colour, the different phases being indicated by full and dotted lines. A considerable number of useful tables, not before easily accessible, are also given. The forces on armature conductors, due to short circuits, etc., are briefly considered, the reader being referred for full details to the author's classic paper on the subject, read before the I.E.E. several years ago. A useful abstract of Field's paper on eddy currents in armature conductors is also given in this chapter. A misprint occurs on page 143, in which the diameter of a No. 13 S.W.G. wire is given as .92 in.

The actual design of armature coils and the formers required for their manufacture is then dealt with in Chapter 7. A large number of photographic reproductions and line diagrams are given, together with specimen specification forms for different types of mouldings, etc. Altogether this is a valuable feature, much information not easily obtainable elsewhere being presented in a convenient form.

Insulation—in one sense the most important part of a dynamo-electric machine—is then discussed. The author has given liberally of his extensive investigations in the subject as well as of those of others. The mechanical properties and strength of many types of insulation are given, and also sound advice regarding pressure tests, insulation resistance, and so forth.

Chapter 9 treats of the difficult subject of ventilation. Turbine-driven machinery, as is natural, is discussed more fully than other types by means of diagrams giving outlines of the schemes adopted by various makers.

Chapter 10 is devoted to the predetermination of temperature rise. Much of the information published in the author's paper, "Heat Paths in Electrical Machinery," before the I.E.E., is reproduced, together with additional matter. The determination of this temperature rise will always be the most difficult part of electrical machine design, but the author deals with the matter in a searching and scientific manner. At the same time, the reviewer knows from personal experience that some of the rules given here do not fit all machines by any means, the rules, however, always giving results well on the safe side.

Part II of the volume commences in Chapter 11. The specification and design of alternating-current generators is first

taken. It may be safely said that practically the whole of the theory of alternating currents that is useful in actual design is given, and also a fairly complete list of references on the subject. We are glad to see that it is pointed out that the ordinary dI formula for commencing the design of a new a.c. generator cannot be intelligently used unless account be taken of not only the regulating properties of the generator, but also the effect which the frequency and speed have upon the number of poles and the cooling conditions of the field coils. Though the book is certainly not of an elementary character, we think a list of dI values might have been included as a preliminary guide. Engine, water wheel, and turbine-driven alternators are all considered in turn, the treatment on the whole being quite satisfactory.

Induction motors are next dealt with in a similar fashion. This time the circle diagram is well to the fore, and also a table of output coefficients is given.

Chapter 13 deals with continuous-current generators. The various types of continuous-current windings are not described since, as the author says, they are fully dealt with in many text books, but the principles governing good commutation receive special attention. No dI table is given, but several different sizes of machines are worked through.

One of the author's specialties is next considered, i.e., rotary converters. Probably Prof. Miles Walker has done more towards developing this type of electrical apparatus than anyone else in the country. Much of the ordinary theory of heating of armature conductors, etc., is not given, quite rightly in a book of this kind, but a considerable quantity of useful information is put forth in an illuminating manner. The application of the various rules is exemplified by outlines of the design of two rotaries. This is a most readable chapter.

The concluding chapter gives a short account of the specification and design of phase advancers. The different types of windings, etc., peculiar to this type of apparatus, are well described.

Taken on the whole, the book is a mine of wealth for the experienced designer. Beginners will not progress very far if they commence with this book—in fact, the author assumes "that the reader is familiar with the laws of electricity and magnetism as applied to the design of dynamo-electric machines, and that he is conversant with the theory and operation of these machines, as given in the many excellent text books on these subjects."

The general method of design is that developed by Mr. B. G. Lamme, of the American Westinghouse Co.

In the specification part of the volume the author—very rightly in the reviewer's opinion—takes the view that it is the function of the consulting engineer or buyer to state precisely what he wants to buy, and to leave to the manufacturer the methods of attaining the results called for.

The book is well printed, and will be for years a classic on the subject of which it treats.

Wireless Time Signals. London: E. & F. N. Spon, Ltd. Price 3s. 6d. net.

The official handbook "Réception des Signaux Radiotélégraphiques par la Tour Eiffel," issued by the Paris Bureau of Longitudes, is of such practical value to navigators, geodesians, explorers, and horologists as to justify completely the preparation of this authorised translation, to which the translators have added useful appendices, tables, and a short vocabulary, materially increasing the value of the book. To the expert this treatise will be found invaluable as a work of reference; to the amateur it provides a lucid exposition of the principles of wireless telegraphy, supplemented by practical notes on the construction of installations suitable for his use in receiving time and weather signals, etc. The arrangement and illustration of the book are admirable, and a very praiseworthy feature is that the book deals thoroughly with its subject matter, and does not wander outside the latter; this is by no means always the case in these days of ramified and detailed technology.

The instructions given for the erection and adjustment of receiving apparatus should enable any one to get good results and to take an intelligent interest in the manipulation of his apparatus. The importance of the Eiffel Tower signals is discussed briefly in Chapter II, and the nature of the signals and the means by which they are produced is then described. The remainder of the chapter is devoted to explanation of methods by which the signals are utilised by the recipient and allowance made for various retardations, etc., to obtain a time reading accurate within 0.1 second or so—which is near enough for navigation, watchmakers', and most other practical requirements. For scientific purposes, and for the benefit of explorers and geodesians, it is desirable to make yet more accurate determinations of time, and the general means by which this is done are indicated in Chapter III. There is no purpose in seeking higher accuracy of comparison than 1/100 or 1/140 second, and this degree of accuracy is already attainable. The methods of making and calculating comparisons by aid of the scientific time signals are described very minutely, and by following the text carefully and referring to the folding plate and typical record sheets included, the reader should learn all that can be learnt from paper in this connection.

Appendix "A" enumerates the time signals and meteorological radio-telegrams transmitted daily from the Eiffel Tower

at the time this treatise was prepared. Appendix "B" deals with augmented weather reports subsequently arranged, and presents a miscellany of useful information, including a timetable, which shows that in almost every hour of the day and night there is (in normal times) some report or official signal of interest and value, which can be picked up even by the amateur. Tables of international time signals, call letters, code and vocabulary, a useful collection of meteorological tables, and a good index conclude a volume which is indeed "indispensable to the great and ever-widening circle of all those interested in wireless." It is, moreover, a work which can be studied profitably pending the time when we can make practical application of the information which it contains.

Experimental Physics. By H. A. WILSON, F.R.S. Cambridge University Press. Price 10s. net.

This is a text-book of mechanics, heat, sound, and light issued in the now famous "Cambridge Physical Series," and although it emanates from Texas, U.S.A., the name of H. A. Wilson, "formerly Fellow of Trinity College, Cambridge," guarantees its English wholesomeness.

The author admits that the writing of such a book, primarily intended for a first-year college course, offers little scope for originality. He appears, however, to have discerned considerable scope for originality in his decisions what to include and what to leave out, justifying his selections by remarking, "the kind of text-book which contains a little about everything does more harm than good."

Dr. Wilson has obviously aimed at excluding everything not of fundamental importance. In each chapter a subject is discussed theoretically and then a few experiments are described fully and the various applications mentioned. Such subjects as Gravitation, Expansion of Solids, Change of State, Convection and Conduction, Resonance and Photometry, appear to lend themselves admirably to the author's "irreducible minimum" method; for it is very true that if a student thoroughly grasps the principles of, say, Searle's Conductivity Experiment, there is no need to teach him any more; he is then in a position to add to his knowledge of Conduction of Heat by reading up details of other experiments for himself. But it seems to us that the method breaks down when it attempts to deal with such a subject as "Motion," including uniform, accelerated and simple harmonic motion, in eight pages. Mechanics, and especially the early portions of the science, cannot be adequately treated without frequent recourse to graphical and other examples, and a mere reading of the chapter in Dr. Wilson's book would not, we fear, put the ordinary first-year college student in a position to tackle problems in Kinematics. The treatment of Force and Motion, Work and Energy, and Mechanics of Rigid Bodies is fuller and, consequently, more satisfactory. The chapter on "Properties of Liquids" is the best in Part I (Mechanics), and suffers least from the author's pronounced tendency to evaporate his subjects nearly to dryness.

Part II (Heat) is thoroughly sound and satisfactory, the best chapters out of eleven excellent ones being those on the conversion of heat into work and the properties of gases.

The subject of Sound (Part III) naturally involves more mathematical treatment, but all the essential experiments are described. The author's capacity for getting to the point in a very few words is especially noticeable in the sections on Reflection, Refraction, Interference, and the Composition of Vibrations. The diagrams in this part of the book are also exceptionally good.

The last part of the book is devoted to the treatment of Light and Radiant Energy, and the author follows the usual methods of dealing with reflection and refraction at plane and spherical surfaces. Dispersion and Colour are given considerable attention, and there are also good chapters on Velocity of Light, Interference, Diffraction, and Polarisation.

On the whole, Dr. Wilson's book is one that can be recommended to first-year college men whose knowledge of physics is scanty; but the mere reading of it will avail but little without the working of numerous examples. Unfortunately, there are no exercises given in the book, but references are given to most of the standard works on the various subjects, so that a student who has access to a good reference library and is prepared to work some examples could not do better than adopt Dr. Wilson's book, remembering in doing so that, to adapt an old maxim, "Examples are better than precepts."

—P. H. S. K.

NEW COMPANIES REGISTERED.

Brown's Motor Accessories, Ltd. (112,891).—This company was registered on February 2nd, with a capital of £3,000 in £1 shares, to take over the business of motor accessory dealers and electrical engineers carried on by H. Lash, at 36 and 38, Roskew Street, Liverpool, as Brown & Co. The subscribers (with one share each) are: H. Lash, 50, Falconer Street, Liverpool, electrical engineer; H. Bebbington, 51, Regent Street, Liverpool, electrical engineer. Private company. The number of directors is not to be less than two or more than five; the first are H. Lash and H. Bebbington. Solicitor: F. Lloyd, 31, North John Street, Liverpool. Secretary (pro tem): Mary C. Dodd. Registered office: 56 and 58, Roskew Street, Liverpool.

Lidgett Engineering Co., Ltd. (142,921).—This company was registered on February 4th, with a capital of £5,000 in £1 shares (15,000 pref.), to take over the business of a mining, electrical and mechanical engineer carried on by G. F. Stevenson, as Stevenson & Co., at Lidgett Electrical Engineering Works, Hoddard Common, Barnsley. The subscribers (with one share each) are: G. S. Marple, Manor House, Oxlade Road, Nether Lidge, Sheffield, iron and steel merchant; G. F. Stevenson, Lidgett House, Hoddard Common, engineer. Private company. The number of directors is not to be less than two or more than five; the first are G. S. Marple and G. F. Stevenson. Qualification, £100. Re-memorandum deposit and managing director as fixed by the company. Solicitor: C. Croxall, 23, Abingdon Street, S.W. Registered by Jordan & Sons, Ltd., 116-117, Chancery Lane, W.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Railless Electric Traction Co., Ltd. (9,872).—Capital, £3,000 in 3,750 ord. shares of £1 each and 5,000 def. shares of 1s. (3,000 pref.). Return dated January 6th, 1916, 2,571 ord. and 5,000 def. shares taken up; £1 per share called up on 2,056 ord. shares; £1,916 paid, leaving £140 in arrears; £763 considered as paid on 315 ord. and 3,000 def. Mortgages and charges: Nil.

Cordoba Light, Power and Traction Co., Ltd. (99,640).—Capital, £1,000,000 in £1 shares (300,000 pref., 1915, 300,000 pref. and 600,000 ord. shares taken up; £1 per share called up on 300,000 pref. and 170,100 ord.; £470,100 paid; £429,900 considered as paid on 429,900 ord. shares. Mortgages and charges: £482,700.

Power Gas Corporation, Ltd. (70,860).—Capital, £300,000 in 250,000 ord. shares of £1 each and 100,000 def. shares of 10s. each. Return dated December 30th, 1915, 249,320 ord. and 100,000 def. shares taken up (exclusive of 380 ord. forfeited); £1 per share called up on 183,138 ord. shares; £183,478 paid (including £320 paid on 380 ord. shares forfeited); £116,462 considered as paid on 66,462 ord. and 100,000 def. shares. Mortgages and charges: £75,000.

Electro Galvanizers, Ltd. (138,767).—Capital, £20,000 in £1 shares (12,000 first pref., 5,000 second pref., and 3,000 ord.). Return dated January 14th, 1916, 11,500 first pref., 4,800 second pref., and 3,000 ord. shares taken up; £19,100 considered as paid. Mortgages and charges: Nil.

Colston Electrical Works, Ltd.—Mortgage on moneys payable to the company by the Corporation of Bristol for installing electric lighting and electric bells at the Ham Green Sanatorium, Somerset, dated January 25th, 1916, to secure all moneys due or to become due from company to City & Counties Bank, Ltd., Clare Street, Bristol.

Masham and District Electric Supply Co., Ltd.—Particulars of £500 debentures, created January 19th, 1916, filed pursuant to Section 23 (2) of the Companies (Consolidation) Act, 1908; amount of the present issue being £440. Property charged: The company's undertaking and property, present and future, including uncalled capital (if any). No trustees.

Footo and Milne, Ltd.—Mortgage debenture, dated January 28th, 1916, to secure £6,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: London County & Westminster Bank, Ltd., 41, Lothbury, E.C.

Hindhead and District Electric Light Co., Ltd. (78,361).—Capital, £30,000 in £1 shares. Return dated May 17th, 1915, 24,142 shares taken up; £13,642 paid; £10,300 considered as paid. Mortgages and charges: £3,450. Returns of statements made up to October 21st and December 19th, 1915, show a further 465 ord. and 42 def. shares respectively allotted for cash.

Burmah Electric Tramways and Lighting Co., Ltd. (75,090).—Capital, £300,000 in £5 shares (20,000 pref.). Return dated January 7th, 1916. All £5 shares taken up; £5 per share called up on the pref.; £100,000 paid; £100,000 considered as paid on the ord. Mortgages and charges: Nil.

CITY NOTES.

Yorkshire Electric Power Co. The net profit for 1915 was £21,209 (1914, £20,535), plus £3,049 brought forward. Preference dividend (6 per cent.) has been paid, £7,500 paid to general reserve, £1,908 written off the 1915 Bill, 1 per cent. is to be paid on the ordinary shares, and £2,478 is to be carried forward. Costs of all materials, especially coal, have been very heavy, but there has been a substantial growth of gross revenue, 27 per cent. of the staff enlisted, and men of military age have attested, and there has been difficulty in obtaining experienced labour and in maintaining the supply. The supply has been largely used by munitions factories, and the demands upon the company in connection with collieries and coke ovens with their associated chemical works for the extraction of valuable products from coal have grown considerably. £13,840 cum. pref. shares have been taken up during the year. Of the 51 per cent. first mortgage debenture stock of the Yorkshire Waste Heat Co., Ltd., only £19,205 is left, and the directors commend this stock to the proprietors of the Power Co. Annual meeting: February 15th.

During 1915 the revenue was £106,044, Lanarkshire an increase of £8,866, and the expenses Tramways Co. were £66,091, an increase of £1,896. £11,000 is to be transferred to depreciation reserve, and after providing for debenture and other interest and other items £20,971 is available. A dividend of 51 per cent. for the year is paid, and 1958 is carried forward. £4,500 debentures have been purchased and redeemed during the year. Four more motor omnibuses will be put into service in March. The accounts will be issued yearly in future, instead of half-yearly. Passengers carried 20,526,000, as against 19,394,282; traffic receipts £104,990, as against £97,958; mileage, 2,264,922, as against 2,330,903.

St. James' and Pall Mall Electric Light Co., Ltd.

During 1915 the connections increased from 15,423 kw. to 16,305 kw., and 10,614,659 units were supplied; the Central Electric Supply Co. is paying no dividend for the year. War conditions have again reduced revenue. The net profit was £18,856, plus £2,417 brought forward, and £4,300 is transferred from the contingency fund. After paying 7 per cent. on the preference shares and 8 per cent. on the ordinary, £2,752 is to be carried forward. The units generated by steam plant were 970,514, and purchased £2,812,257 = 13,812,751. Private supply required the number stated above, works accounted for 242,343, batteries 267,103, transmission and transformation for 1,899,552, and distribution, &c., for 729,144. At the annual meeting on Tuesday next shareholders will be asked to increase the borrowing powers from one-half the nominal capital to £50,000 in excess of that amount.

Metropolitan Railway Co.

The directors' report for 1915 shows as follows:—Total net income £595,676, plus £11,458 brought forward. Deducting interest, renewals, and preference dividend, £77,633 is available for ordinary dividend, which is 1 per cent. for the year, leaving £13,041 to carry forward; £15,000 has been transferred to general renewals fund. The ordinary dividend for 1914 was £1 4s., and £11,458 was carried forward. The new viaduct at Kilburn had brought considerable additional traffic, owing to the improved train service that it had made possible. Under the arrangement with the Government, the company pays interest on the capital outlay on new lines and works, but receives no benefit from the improved earnings, and representations have been made to the Government on the point. Traffic on the G.N. and City section has largely increased. Notwithstanding the dislocation of business, the traffic of the entire railway was larger than in 1914 and 1913, and, while every possible economy had been introduced, they had not materially reduced the number of trains run. The annual meeting was held yesterday.

Llandudno and Colwyn Bay Electric Railway, Ltd.

Traffic receipts during 1915 increased by £1,811, largely due to the Old Colwyn extension, but increased cost of stores and frequent changes in staff caused less efficient and less economical working, so that the net profit is £5,414, only slightly larger than for 1914 (£5,114). Adding £562 brought forward and deducting sinking fund instalment, etc., £4,408 is available, and a dividend of 4 per cent. absorbs £3,976, leaving £432 to carry forward. The sinking fund instalment is considered sufficient to meet depreciation. The route length in operation is now 8½ miles, and all the lines for which powers have been obtained have been constructed. Annual meeting: February 11th.

Paisley District Tramways Co.

For 1915 the revenue was £68,079 and the expenditure £45,757. After allowing for debenture and other interest and sinking fund charges, and including £3,200 brought forward, the balance is £19,488. £6,500 is put to reserve, 5 per cent. is paid on the preference shares, £2,000 is put to preference share sinking fund, and £3,478 is to be carried forward. Traffic receipts increased by £6,141, but expenses have largely increased. Work on the maintenance of track and rolling stock is deferred owing to scarcity of labour, and £2,000 more than usual has been carried to reserve for this purpose in future. The system is being carried on with difficulty, owing to abnormal circumstances, but so many munition workers use the system that the number of cars run cannot be reduced. Passengers carried 14,978,962, as against 13,755,904; car mileage 1,367,926, as against 1,378,120. Annual meeting: February 29th.

Chatham and District Light Railways Co.

During 1915 the revenue was £60,917, an increase of £9,865, and the expenses were £32,230, a heavy increase. £6,000 is to be transferred to depreciation reserve, and after providing for rent of Rochester Corporation lines £3,744, debenture and other interest, and other items, £15,733 is available. After paying 6 per cent. on the ordinary shares for the year, £3,150 is carried forward. Owing to shortage of labour and other causes, the track and rolling stock have not been maintained in their usual state of repair; £1,000 has been put to maintenance reserve to enable these repairs to be carried out when labour conditions are more favourable. A reduced service of cars has been run. £8,200 debentures have been repurchased and redeemed. Passengers carried 12,755,428, as against 10,662,928; traffic receipts, £60,357, as against £50,499; car mileage 1,029,535, as against 1,133,762.

Calcutta Electric Supply Corporation, Ltd.—The units sold during the five weeks ended December 31st, 1915, were 1,778,448, compared with 1,224,134 units in 1914.

Liverpool Overhead Railway Co.—A final dividend on the ordinary shares at the rate of 4 per cent. per annum brings up the total distribution to 3½ per cent. for the year.

Cambridge Electric Supply Co., Ltd.—A final dividend of 3 per cent. on the ordinary shares brings the total distribution up to 5 per cent. for 1915.

Dublin United Tramways Co., Ltd.—Mr. W. M. MURPHY, the chairman, told shareholders at the annual meeting that the gross receipts for 1915 were the largest in their history, being £333,889, against £321,896 in 1914, of which £11,677 was due to an increase in passenger traffic. The gross expenses exceeded those of 1914 by £18,143, the increase in expenses being greater than that in receipts by £6,140. Besides producing 803,889 more units of electric current, the average cost of about 24,000 tons of coal consumed was 3s. a ton higher than in 1914, being 18s. 5d. against 15s. 5d. The greatest increase in expenses was under the head of maintenance, amounting to £10,154, £2,700 of which represented new car motors and electrical car equipment.

Tyneside Tramways and Tramroads Co.—The directors recommend a dividend of 3 per cent., less income-tax, on the ordinary shares, £1,460 is placed to reserve for renewals, £500 to special reserve, £250 is applied to loss on conversion of Consols into War Loan, and £625 is to be carried forward.

Dr. J. T. MERZ, at the meeting on Tuesday, said that the receipts had not been materially interfered with. There had been a marked increase in the ordinary traffic, but the holiday traffic had been less by some £1,400. They had run fewer cars, but had carried more passengers. The increase in expenditure was largely due to repairs and upkeep of the line.

Sunderland District Electric Tramways, Ltd.—After providing for interest on the prior lien bonds and the first mortgage debentures, and for sinking fund instalment, and making provision for depreciation on investments, there remains a net profit of £1,759. After paying interest at the rate of 2½ per cent. per annum (less income-tax) on the first income bonds, £651 is to be carried forward. The traffic receipts show a decrease of £522, but owing to economies in working expenses there is an increase in the profit of £580. The annual meeting was held in London on Tuesday.

Electrical and Industrial Investment Co., Ltd.—The net revenue for 1915 was £11,500, plus £10,377 brought forward. After paying 6 per cent. on the preference and 5 per cent. on the preferred ordinary shares, £10,878 is to be carried forward. The investments have been written down in accordance with the capital reduction scheme (£85,500). The balance at credit of reserve is £29,372. The company holds 225 investments standing at £545,681. Annual meeting: February 16th.

Central Electric Supply Co., Ltd.—During 1915 energy was supplied to the Westminster, St. James', and Chelsea Companies to the tune of 28,984,437 units. After allowing for sinking fund and depreciation, the net balance is £1 17s. 1d., plus £6 brought forward, and the amount is to be carried forward.

City of Buenos Aires Tramways Co. (1904), Ltd.—The annuity has been received from the Anglo-Argentine Tramways Co., and the net revenue for 1915 was £66,341. After paying 5 per cent. dividend for the year, £4,200 is transferred to the general amortisation fund, carrying forward £141.

National Electric Supply Co., Ltd.—A final dividend of 4s. 6d., making 7s. per share for the year, as compared with 8s. for 1914, is announced. £633 is carried forward, as compared with £1,310 brought in. £5,000 is put to depreciation.

National Gas Engine Co., Ltd.—The net profit for 1915 is £70,960. After paying 7½ per cent. on the ordinary, £30,520 is to be carried forward. Annual meeting: February 15th.

Smithfield Markets Electric Supply Co., Ltd.—Dividend 2 per cent. for year, carrying forward £1,300.

Parsons Marine Steam Turbine Co., Ltd.—Interim dividend 10 per cent., less tax.

Wadebridge and District Electric Supply Co., Ltd.—A dividend of 6 per cent. is announced.

STOCKS AND SHARES.**TUESDAY EVENING.**

The electricity supply market was not affected by the dividend declarations which have been made up to the present. The West End companies, as it was generally supposed they would, have lowered their rates, but the South London provided a pleasant surprise by announcing the same dividend as that of a year ago—namely, 5 per cent.—on the strength of which the shares rose 7s. 6d. to 3½. The St. James' & Pall Mall Co. has lowered its dividend to 8 per cent., being a reduction of 2 per cent. as compared with last year. Business for weeks past has been very quiet in the whole of this section, as we have noted from time to time; so it can scarcely be said that the Stock Exchange market has undergone any pronounced change. There is more doing in Latin-Canadian issues than in most of the home electrical securities, while the activity in rubber shares has been resumed to some extent. The effect of the removal of minimum prices from Colonial Government stocks has been carried still further amongst the ranks of gilt-edged descriptions in the industrial departments. Where prices remain the same as they stood before the changes came about, the holder should hesitate to congratulate him-

self until he finds that the nominal quotation is an actual one from the point of view of the seller. It is, however, cheerful to observe how the Colonial stocks, which were exceedingly weak when the market in them was allowed to become a free one, have now mended considerably. Buyers have come forward to such an extent that the trouble is at present to find stock to satisfy them, instead of the other way round; and this, of course, exerts its sympathetic influence upon the preference stocks, preference shares, and pre-ordinary issues of industrial and most other companies.

Business generally is quiet, and the declaration of a satisfactory batch of Home Railway dividends left the market cold. The railways are certainly doing better than might have been expected or supposed, and if they can make such good progress under the present difficult conditions, the outlook may be regarded with composure for the future.

Reference has already been made to the revival of orders in the Latin-Canadian list. It has been fairly well distributed over the principal companies concerned, and a good part of the buying is known to proceed from New York—in this spite of the fact that United States investors are obviously troubled as to the potentialities contained in the present diplomatic situation between their country and Germany.

Pennsylvania Water & Power shares have risen 3 points to 78½, Shawinigan is 2½ up at 138, there are buyers about for Kamistiquia Power capital stock, and Canadian General Electrics are harder. On the other hand, the Mexican group is very dull. Several of the bonds in the utility companies are lower, the falls ranging from 1 to 3 points. The news from Mexico is far from encouraging; and although hope has not yet been lost, and optimists avow that Mexico stands upon the very eve of a turn in her fortunes, there are certainly no buyers of Mexican stocks. Per contra, if good news does come in, quotations will be restored with a rapidity even greater than that with which they fell; and the risky speculator has plenty of scope for his fancy in this department just now.

British Columbia Electric preference stock has fallen 3 points, and the yield therefore rises to over 9 per cent. on the money. The information which comes from Vancouver seems to suggest that British Columbia has so far missed its proper share of the more cheerful financial conditions that prevail in Canada, as compared, say, with a year ago.

In the foreign section, Brazilian Tractions have fallen back to 49½, two or three hundred shares coming to market and finding no willing home awaiting them. Anglo-Argentine Trams second preference rose to 3½, and the remaining issues in this group are steady. The Telegraph market is irregular. Great Northerns are 5s. better, and Anglo-American preferred gained a point to 10½—this, by the way, being the price which the Treasury is bidding for New York Telephone 4½ per cent. bonds. Oriental Telephones have weakened, the price going back 3s. 9d. on the offer of shares the other day. Marconis are dull at 37s. 6d., the subsidiaries being also inclined to weaken after their recent spurt. Globe ordinary at 10½ are the fraction down.

Amongst manufacturing shares, British Westinghouse preference are prominent with a rise of 2s. to 2½, more than recovering their reaction of last week. Callenders gained 2, and Edison & Swan fully-paid shares rose 5s. to 1½, although the partly-paid at 7s. are a trifle lower. Babcock & Wilcox declined 1/16, while other iron and steel shares are mainly good.

The price of copper had a dramatic jump of £4 a ton on Tuesday morning, and this brought about a sharp rise in the prices of most copper shares. The rubber market exhibits noticeable strength, and there is still a remarkable amount of business doing, the demand for shares coming from all parts of the country. The spring reports of the companies and the final dividends are sure to make good reading for the shareholders, and it is largely upon the strength of expectations connected with these that the market is so hard in tone.

The Batti-Wallahs.—The committee of the Batti-Wallahs' Society is calling an informal meeting of the society for Friday, February 25th, at 6 o'clock for 6.30, at the Victoria Mansions Restaurant, Victoria Street, S.W. The usual informal meal will be followed by a concert.

NOTES ON ELECTRIC WELDING PRACTICE.

(Continued from page 183.)

Clamping.—The question of the arrangement of the clamping jaws is important in any butt welding operation. The jaws have necessarily to be heavy and to have large contact surface to carry the heavy welding current without overheating themselves or the work. On the other hand, their considerable mass and clamping surface offers a ready path for escape of heat by conduction from the weld, and a certain projection of the work is desirable to hasten and localise heating and save current. If the nature of the work demands support close up to the joint, the current used must be heavier to "overtake" the more rapid cooling.

Wrought iron or mild steel bars of equal section each project $\frac{1}{4}$ to $\frac{3}{8}$ of their diameter if the weld is to be made on the impact or flash principle, but if a boss is to be built up, more extensive heating is required, and each rod projects $\frac{1}{2}$ to $\frac{3}{4}$ diameter. Copper and brass, owing to their high thermal conductivity and the greater amount of stock absorbed in the weld (due to the metal being practically molten at the moment of upsetting), must project considerably more than iron—say, $1\frac{1}{2}$ to $2\frac{1}{2}$ diameters for copper and rather less for brass. A weld in small copper wire may take up 1 diameter or more of stock.

In order that both pieces welded may reach welding heat at the same moment, it is necessary that the relative cooling facilities be the same for each, and this is particularly important where copper, aluminium or brass are concerned, for the weld must then be completed directly welding heat is reached. It therefore follows that if one piece is of larger section or of more highly conducting metal than the other, it (the first) should project further from the jaws. The projection is roughly proportional to sectional area of work in the case of unequal sizes of the same metal; and where different metals are concerned compensation should be made by projection or sectional area (or both) for differences in thermal conductivity. The conductivity of copper being about six times that of wrought iron, the copper should project say three times as far as the wrought iron in case of a weld being desired between the two. If possible, the section of the copper should be reduced as well. To secure correct degree and timing of heating, a low carbon steel to be welded on to a high carbon steel should project $2\frac{1}{2}$ or 3 times as far as the latter—say, $1\frac{1}{2}$ and $\frac{3}{8}$ diameter respectively.

The procedure in practice is to set up two pieces with approximately correct actual and relative projections as determined by experience, and then to make a trial weld, noting the time taken to attain welding heat and the uniformity of heating, etc. Locating stops and upsetting springs or weights being once adjusted, their setting should be noted for future guidance, and repetition work can be at once commenced. Tables or charts can be drawn up to facilitate adjustments for given classes of work.

In cases other than that of simple end to end welding of round or rectangular stock, the disposition of the jaws is of even greater importance, and it is sometimes necessary to employ auxiliary heating to allow for the greater mass or conductivity of one piece. Typical examples of the kind of problem involved are illustrated by figs. 19-21. In the case of the simple right angle corner weld a projection ratio (a/b) of 2:1 will generally allow for the easier escape of heat along A as compared with B. A tee-joint offers yet greater opportunity for heat escape along A (fig. 20) as compared with B, and, unless the jaw C is comparatively near that edge of A remote from B, the zone of heating is as dotted due to lateral conduction in A and heat absorption by C. A simple means of getting over the trouble is to use three jaws as in fig. 21, first passing current between 1, 1 till the piece A is sufficiently preheated, and then passed between

2 and 1, 1 to complete the weld. This course is practically essential if the piece B is considerably lighter in section than A. The two current distributions may be effected by a 2-way switch, or two distinct transformers may be used as shown diagrammatically in fig. 25, if the nature and amount of work justifies the construction of a special machine. The sketch is self-explanatory, the essential feature being the use of two transformers, S, T, to preheat the heavier piece and weld on the tee-piece respectively. In the past gas flames have been used for preheating, but, except for filling-in or building-up work using arc equipment, it is difficult to conceive any case to which electric preheating-clamps cannot be applied advantageously.

Building up a tee-piece from three separate pieces is easily effected by a 3-jaw arrangement, as in figs. 22, 23. The pieces A, B are first butt-welded, and incidentally preheated for the second operation of welding C into the first-formed burr.

The question of jaw or electrode shape is closely associated with that of clamp arrangement, and, whilst demanding special consideration for each case is solved by application of the general principles already enunciated. For ordinary butt welding the clamping jaws have to represent a compromise between massiveness required to carry very heavy currents and lightness required to reduce heat abstraction from the work; from the mechanical standpoint, they must admit quick insertion and removal of work, and transfer sufficient clamping and lateral force to the latter without injuring its surface. To

FIGS. 19 TO 24.

hold strips (or the ends of hoops) which are wide for their thickness, in exact alignment, serrated intermeshing jaws may be used, these supporting the work practically at its edge yet permitting more rapid and even heating than straight-edged jaws. In spot or seam-welding the bearing surface of the two electrodes may be unequal to allow for difference in section or conductivity of the pieces joined. For instance, using a truncated cone or electrode against spot or seam-welding, the bearing surface of the two sheets, the sheet of higher conductivity would be placed on top. Similarly, a conical and troughed electrode combination, as in fig. 24, concentrates heat at the seam of a tube to be welded.

Preparation of Work.—Some of the work which should be done before starting to weld is, one might think, obvious, but it is not always performed. Before filling in blowholes by the arc process, the top of the hole should be opened out, so that the cavity is accessible to complete filling, and the interior surfaces cleaned thoroughly. Though butt welding on the "flash" principle expels automatically any reasonable amount of foreign material from the weld, it is unreasonable to deliberately leave the surfaces to be joined in a dirty state. A sandblast or grinding wheel, as may be most convenient, should be used to remove scale or oxide. Forging scale may be removed by a hot pickle of 1:50 volumes of sulphuric acid and water, followed by rinsing and dipping

in milk of lime. The gripping surface for the jaws (in butt welding) should be clean as well as the actual welding surface. By attending to preliminary cleaning overheating at the jaws is prevented, time and current are saved, and the risk of flaws is eliminated.

Something has already been said regarding electric preheating by resistance heat; generally it is limited by considerations of cost to comparatively light pieces. Any piece which can be welded by the resistance process can, of course, be preheated by the same means, and having welded, say, a wheel tire, the whole of the latter can be heated electrically for shrinking-on purposes, conveniently and with

the ease and reliability of welding thus increased, but cleaning up the finished joint is facilitated.

Similarly, the joint between a knife and metal handle should be made at B B, fig. 26—where there is uniform section on either side, and the small welding fin is easily ground off.

(To be continued.)

MODERN PRINTING TELEGRAPHY.

ON January 27th Mr. H. H. HARRISON, 'A.M.I.E.E.', read a paper before the INSTITUTION OF ELECTRICAL ENGINEERS on the principles of modern printing telegraphy, in the course of which he reviewed the history of the subject, and described the essential features of the various systems that have been evolved. The system invented by David Hughes in 1854 was the first to achieve permanent success, and was followed by the Baudot multiple system 20 years later. The broad principles on which a printing telegraph should be designed were first clearly defined by Donald Murray, in his classic paper read before the Institution in 1905. Almost all inventors of modern systems have adopted the five-unit alphabet, with the result that the devices employed by them follow similar lines. A fundamental requirement for success is that the operation of the system shall not depend upon the strength, but the direction of the received current, unless, as in the case of a submarine cable, the line is far removed from external electrical disturbances. By varying the number, duration, or moment of appearance of the signal elements a single wire can be employed to transmit impulses which select the desired characters, cause them to be printed on a tape, and advance the tape for the next letter.

Using the five-unit system, means have been devised to enable each combination of signals representing a letter to be dispatched by the simple depression of a key, as in ordinary typewriting; but in order to avoid loss of time due to other necessary operations it is found better to store the signal permutations so that the line can be kept working whilst the operator is otherwise engaged, rather than to send the signals direct to line as formed. The usual method of storage is by causing the depression of each key to perforate a paper tape in a corresponding manner, the tape being then fed into a mechanical transmitter. Arrangements have been devised for enabling errors in keying to be obliterated without affecting the receiving apparatus, and for stopping the transmitter when it outruns the perforating mechanism, in order to avoid tearing the tape. The transmitter is automatically started again directly the operator catches up with it by a device due to Murray. At the receiving end the signal sequences are stored, and combined to set the printing wheel, which then prints the proper character, and the mechanism is automatically reset for the next letter. Ingenious devices have been developed to enable the printing to be effected either on a tape, on a continuous web of paper, or on separate pages, which are automatically fed into the mechanism; not only so, but the sender can ensure starting each message on a fresh page, and the mechanism even sends him a warning signal when a page is full.

For circuits carrying comparatively little traffic, the single-channel low-speed step-by-step printer, using the Baudot alphabet, and perforated tape, and manually-operated, is quite suitable. Several systems are described by the author, including one of his own invention. A feature worthy of note in single-channel printers is that in order to give time for printing a letter without delaying the working of the system, two groups of setting magnets can be employed, so that while one character is being printed the next can be prepared. This is known as the "overlap" principle.

All modern high-capacity systems depend for their operation on the maintenance of synchronism between rotating mechanisms at both ends of the line, which involves two main requirements—the maintenance of uniform angular velocity of the rotary devices, and the maintenance of a definite phase relationship between the sending and receiving apparatus. Numerous devices have been worked out for these purposes, and are described by the author. Usually a shunt-wound electric motor is the driving agent, and is provided with a fly-wheel with special fluid damping features.

Speed governing is effected with the aid of a tuning-fork, so connected with regard to the motor that resistance in series with the armature is periodically short-circuited for longer or shorter periods and the speed maintained constant. The "phonic wheel" of Rayleigh and La Cour, which consists of an iron star-wheel kept in rotation by alternating currents supplied by means of a vibrating reed, makes a most satisfactory and reliable motor of constant speed. To keep the sending and receiving apparatus in step with one another, one is made the controller and the other is adjusted to run slightly faster or slower; means are then provided for automatically correcting the phase of the latter whenever it departs

FIG. 25.

economy. In the case of castings or other massive pieces, preheating by gas-torch or by gas ring or coke fire or muffle furnace is generally desirable. Electric resistance welding is then impracticable, and though an arc between separate electrodes (e.g., Voltex) could be used, the heating effect would generally be too intense and too local.

More or less mechanical preparation is necessary in all but the simplest welding jobs. Except in the case of very thin plates (to which arc welding is not very safely applicable), the edges of plates to be arc welded should be chamfered to ensure penetration of heat and added metal. To allow for the difficulty of sound welding throughout the thickness of a flange on a pipe, the former should be bored taper and the latter bell-mouthed, thus affording valuable mechanical support to the weld.

Various means of clamping and preheating to allow for inequality of section or mass in butt welding have been described, but best of all is to arrange that the sections welded are equal whenever possible. This can frequently be arranged either by preliminary

FIG. 26.

machining or by judicious selection of the position of the joint. For instance, in welding bolt heads to bar stock (to save machining the whole bolt from the solid), the weld should not be at the base of the head itself: rather should the head blank be chosen large enough to permit $\frac{1}{2}$ in. or so to be turned down to the bolt diameter, the weld being then made on the end of the stub so formed (A, fig. 26). Not only is

from exact agreement by a known amount. The corrections can be generated by the signals themselves; several methods of doing this have been devised and are described.

The last section of the paper deals with modern developments, tending to economise time and plant. The high-speed one-channel apparatus is known as "automatic," and the low-speed multi-channel apparatus "multiplex," but in many respects they are identical. The latest high-speed system is capable of printing 1,000 letters per minute without blurring; the paper being struck against the type-wheel by an electromagnetic hammer which is actuated by a condenser discharge. The printing time in any multiple system does not involve waste of line time, so that overlap is not necessary; the line is practically placed at the disposal of one, two, or more, up to five or six, operators in succession for the transmission of signals, by the rotation of distributors divided into sectors. As the signals may be sent in either direction, by each channel, it is evident that a variety of combinations of traffic can be made. Here a difficulty arises on long lines, due to the appreciable lag of the incoming signals, so that they begin to encroach on the outgoing signals, and special means have to be adopted for dealing with this trouble, which reduces the efficiency of line use; in fact, if the lag is serious, it is preferable to use separate lines for up and down traffic. The signals can be automatically repeated at intermediate stations, and as distortion of the signals results from repeated repetitions, they can also be retransmitted in as perfect a form as that in which they were first dispatched, and this process greatly increases the flexibility of the multiplex telegraph.

The author concludes that the five-unit equal-letter alphabet now holds the field, and that high-capacity systems transmitting letter by letter at 40-45 words per minute per printer unit can be made of strong construction and at diminishing first cost. Except where saving of line time is of the first importance, it is better to provide special segments for the correcting impulses rather than to correct by the signals themselves, the former method having the advantage of automatic phase-finding. On the less important circuits the type-wheel tape printer of low first cost has a large field, but for the high-capacity circuit the page printer holds undisputed sway.

In the discussion which followed the author received many congratulations on the comprehensive character of his paper, which Mr. DONALD MURRAY regarded as sufficiently detailed to enable any competent engineer to construct such apparatus.

In opening the discussion, Sir WILLIAM SLINGO pointed out that printing telegraphy had been hindered in its early stages by conservative feeling, but its increased legibility, saving in time of transcription, &c., were now appreciated, and it was now a question of high-speed automatic *versus* multiplex working. He noted the absence of reference to photographic methods, which the author subsequently discounted from a practical standpoint, and discussed at some length the Siemens automatic system, which, he said, attained a working speed of 166 words a minute, but Mr. Harrison did not think this speed would be maintained in practice. The Morse code was not twice as long as the five-unit code, the proportion being 8:5. He disagreed with some of the author's conclusions, and thought that page printing would in the end prove more satisfactory than tape printing.

Cdr. SOUTER urged telephone and telegraph engineers to draw freely on wireless developments with a view to improving their art, while Mr. WALTER JUDD pointed out that the Eastern Co.'s long-distance cables were fitted with the Creed system and perforators; all messages were printed off ready for delivery in the city.

Mr. DONALD MURRAY pointed out by comparison with the interconnected electric supply system on the N.E. Coast (see *ELEC. REV.*, page 28) that a great deal remained to be accomplished before a paper on printing telegraph networks could be written. Mr. RAYMOND-BARKER suggested that to complete the comparison of telegraphic codes, a graph of the cable code should be added; the word "London" would represent 49 units as against 69 units with Morse, and Major BOOTH, referring to the same comparison, said the results could not be taken as an indication of value for line working; he thought Mr. Murray had been surprised to see the Hughes instrument printing as fast as his up-to-date apparatus, but it was illegible. He also doubted whether any ordinary type-writing mechanism would stand the high speeds of modern telegraphy.

Mr. TYRELL mentioned the reliability of the Baudot apparatus at Antwerp just at the time of its surrender, and despite the efforts made to interfere with the working; he pointed out, in reply to Sir William Slingo's suggestion that printed messages would not have been trusted 20 years ago, that many thousands of printed telegraph messages were being distributed in the city, to stockbrokers and others, quite 30 years ago.

THE "MACHINERY AGE" IN FARMING.

AN interesting review of the economic conditions which will confront the British farming community after the present war—and which are even now influencing this industry—was contained in a paper presented at the last meeting of the Farmers' Club in London recently, by Mr. W. J. MALDEN. The theme of both the paper and discussion which followed it, was the inevitable necessity of meeting the deficiency of manual and animal labour by the introduction of power-driven appliances on a wholesale scale, particular stress being laid on the value of the oil motor for ploughing and other purposes.

It is not for us to discuss the pros and cons of oil or steam power on the farm, but rather to point out that at the best, either is merely a stepping-stone to the use of electricity for all farm purposes: for power, traction, light, intensive cultivation of crops, poultry incubation, and the production of artificial fertilisers. At present the farmer is groping in the dark, and we share with the author his difficulty in understanding why the Board of Agriculture should not employ the highest engineering skill, as well as the best chemical, veterinary, bacteriological, and poultry experts. Assuredly there is need of expert guidance to ensure that the future of agricultural engineering generally shall not be wrecked on a side issue.

We have previously drawn attention to this subject* and urged on the Board the necessity of opening an inquiry into the subject of agricultural electric supply generally, with a view to studying our national requirements in this connection, because sufficient evidence has been obtained to place beyond doubt the utility of electrical methods on the farm, and, furthermore, because the economic prosperity of the country demands that steps shall be taken to co-ordinate our industrial operations, particularly where they can be made interdependent and mutually helpful to one another. Although, judging from the remarks made by Mr. Malden, one might almost

GENERATING PLANT ON A NOTTINGHAMSHIRE FARM.

assume that an oil or petrol motor-driven tractor for ploughing, or other purposes, represents the panacea for all present and future farming troubles, and that the newly-discovered adaptability of this type of machine is such as to discount experiment in other directions, yet he himself admits that the (oil) motor is in a comparatively crude form, and that whether it would be so valuable in cultivating small British fields in a climate so wet as ours, and where so much land is on the heavy side, as a tractor or windlass hauler—avoiding the necessity of running heavy engines over land after it has been ploughed—has yet to be proved.

We have touched on this matter because it would be a great mistake to defer consideration of the known utility of electrical methods generally on the farm, solely because an unproved oil or petrol tractor for ploughing and haulage has made its appearance, especially as electrical ploughing has distinct possibilities of its own. Experimental electric ploughing on an extensive scale has taken place in several European countries with favourable results in comparison with steam and oil power; in Germany a number of electric ploughing equipments are in operation, while in this country we can point to a small Nottinghamshire farm—to which we refer later on—which has depended on electricity for ploughing, thrashing, and power and lighting generally, for several years past, apparently with satisfaction to the owner.

* *ELEC. REV.*, December 3rd, 1915, page 729.

Given suitable recognition of the utility of electrical methods on the farm, the apparent obstacle of the moment—the lack of supply facilities in agricultural areas—could be easily overcome, especially in the neighbourhood of the established supply undertakings which, as has been shown in our pages, are sufficiently numerous and widespread to cater for the initial requirements of any general scheme for farm and village supply. We have it on the authority of Mr. Malden's paper that an almost unlimited number of "motors" (oil or petrol engines and tractors) could be sold to the farming community

tackle overcame this difficulty it introduced others equally serious—the ploughing engine being too heavy to run over the land in wet weather, and in any case requiring the services of two or three men and a horse to carry fuel and water, in addition to three men working the ploughing tackle.

Mr. Chorlton called in Messrs. E. O. Walker & Co., engineers, of Manchester, who designed and installed the equipment which has been in use since 1910. This consists of a 25-h.p. suction gas engine, with producer, &c., driving by means of a belt a 500-volt direct-current dynamo, this plant

ELECTRICALLY-OPERATED PLOUGH, WITH HAULAGE TROLLEY, OVERHEAD WIRES, &c.

at the present time—in fact, the machinery age in farming has arrived, and, despite the difficulties which beset us at the moment, the present is a golden opportunity which may not occur again to introduce power appliances to the farmer and one which electrical engineers and electricity suppliers would do well to seize on with a view to the future development of electricity supply in the hitherto neglected agricultural districts.

being installed in an outbuilding at the farm, where it supplies electric lighting and local power requirements. In addition, this plant supplies overhead distribution wires, which are carried on poles to various parts of the farm, and which supply the electric ploughing tackle in the field.

The ploughing gear is on similar lines to steam ploughing tackle, consisting of two special trolleys carrying electrically-driven haulage gears, which are placed at opposite sides of

HAULAGE TROLLEY FITTED WITH ELECTRIC MOTOR AND PULLEY FOR BELT DRIVING.

ELECTRICITY ON A NOTTINGHAMSHIRE FARM.

Some five years ago, a Mr. Chorlton conceived the idea of introducing electrical methods at his 240-acre farm at Cotgrave, near Nottingham, more particularly with a view to overcoming ploughing difficulties arising from the heavy clayey nature of the land, which had necessitated the use of three and four horses to pull the plough through a furrow, resulting in excessive puddling of the latter. While steam ploughing

the field and haul a reversible three-furrow plough to and fro between them by means of a wire cable; the haulage trolleys are moved on a short distance after each successive journey of the plough, a cable drum being fitted to the trolley for this purpose, the cable of which is anchored at the farther end of the field. It will be noted in our view of the plough at work that the overhead wires are tapped by flexible cables arranged to hook over and slide along them.

Originally a double-ended five-furrow plough was in use, but this has been superseded by a lighter double-ended three-furrow plough in view of the experience gained; as regards the matter of experience, Messrs. Walker found it necessary to experiment in the first instance with a two-horse plough fitted with a dynamometer, in order to obtain some idea of the tractive effort required. In the case of the tackle actually employed now, the hauling rope, about 400 yards long, weighs about half a ton, and a pull of up to five tons is required when hauling up hill. It may be added that the 25-H.P. gas engine requires some coaxing before it will take the load after it has been running light, while the ploughing tackle is being adjusted; but despite this—and contrary to the views held before the installation was put in, that a 25-H.P. plant would not pull a single-furrow plough—it is found possible to pull three shares through the heaviest and stickiest clay, ploughing three furrows 8 in. or 9 in. deep and 9 in. or 10 in. wide.

The haulage trolleys weigh about 4 tons each, and they are employed where possible to pull each other on heavy land, but experience shows that they can be greatly improved by making them self-moving in future.

It is obvious that with electric power available in different parts of the farm, many operations can be facilitated by its use.

The electric motors on the haulage trolleys are provided with pulleys providing for a belt-drive to any type of machine,

attached to the connector. By this arrangement all the strain is taken from the actual connection, and, further, practically no heat touches the flexible cord itself. Again, it will interest you to note that there are four points of contact on each terminal.

Hotpoint Electric Heating Co.,

L. G. HAWKINS.

London, W., February 3rd, 1916.

[The connector referred to is certainly a very good one, which ought to give very little trouble.

We drew attention to this connector in our issue of November 27th, 1914, when writing of the "El Radio" radiator, without, however, giving details.—EDS. ELEC. REV.]

The I.E.E. and Alien Enemy Members.

With reference to the correspondence in your columns regarding the Institution of Electrical Engineers and Alien Enemy Members, all those who wish this matter settled in the only patriotic and reasonable way should refuse to pay their subscriptions until the matter is properly dealt with.

May I, at the same time, ask the following questions:—

What are the advantages of being a member of the Institution in any grade?

THRASHING MACHINE ELECTRICALLY DRIVEN FROM HAULAGE TROLLEY.

and one of our views shows a thrashing machine being driven in this way. Harrowing, mowing, cutting drains with the implement already used with steam ploughs and any other operation done with steam ploughing tackle can be done with the electric tackle used on Mr. Chorlton's farm. We understand that this gentleman is well satisfied with his installation, which is run by farm hands—the farm foreman being the chief engineer. We may add that a field, 280 by 280 yards, of heavy clayey soil has been ploughed to a depth of 8 in. with a coal consumption of 1½ tons; obviously the cost would be less were it possible to obtain electricity at power rates for ploughing, and Messrs. Walker estimate that nine miles of single-furrow could be cut per hour at a cost of energy of 4d. on the basis of 3d. per unit, or *pro rata* for higher prices.

We are indebted to Messrs. E. O. Walker & Co. for the particulars of this installation; we have also drawn on a short article published in the *Manchester Guardian*, through whose courtesy we are enabled to publish the accompanying views.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Electric Iron Connections.

We understand that one of your interested readers a few weeks ago made reference to the unsatisfactory flat-iron connector which he had been in the habit of using. We should specially like to draw your attention to the sample connector which we are taking the liberty of sending to you, and would bring to your notice the specially prepared flexible wire, which we use together with the special fibre bar

What inducement is there for a student to apply for transference, with its fee and extra subscription?

What has the Institution done to assist young, struggling engineers to earn a sufficient salary to meet such new liabilities? Admitted there are the lectures and the lending library, but, apart from these, it seems to me that the advantages are nil.

The Institution is closed, or, at least, the library is, during the hours when most members of the electrical profession can visit it, and it is impossible for a student to use the library to his advantage.

Is it correct that members of the Council have facilities for dining on the Institution premises? and what would happen to the student who took his frugal lunch to consume on the Institution premises?—yet his 1½ guineas is more to him than the higher subscription to the member.

What is needed is an Institution on the lines of the American Westinghouse Electric Club.

A Student.

February 6th, 1916.

With reference to the letter of "Alien-ate(r)" in your issue of February 4th, we shall be glad to receive the support of other members if you will be good enough to accept them.

The dastardly air raid of January 31st should assist in enforcing our demands.

Six Borough Electrical Engineers.

February 7th, 1916.

[An important decision of the Council of the Institution will be found in our "Notes" section.—EDS. ELEC. REV.]

B.E.A.M.A.—The following firms have been elected members of the B.E.A.M.A.:—Ferguson, Pailin & Co, Opusshaw; Mirrieles Bickerton & Day, L'd., Hazel Grove, near Stockport; Callender's Cable and Construction Co. Ltd., has been elected a member of the Council for the session.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

EGYPT.—Revised tariff valuations for use in assessing import duties on certain metals have been issued, with effect from December 31st, 1915, to January 31st, 1916, or until denunciation, as follows:—

	Valuation per kilogramme. Millièmes.
Copper and brass sheets, round and bottoms	114
Copper sheets, plain	111
Copper sheets in rolls, bars, round and flat	111
Copper ingots	108
Copper wire	<i>ad valorem.</i>
Brass wire	"
Brass sheets, plain, 24 by 48, 8 lb. to 5 lb. ...	"
Tin ingots and bars	168
Lead sheets	31
Lead shot	32
Lead pipe	31
Lead, pig	31
Zinc sheets	105
Zinc ingots	105
Phosphor bronze	105
Antimony	130
Quicksilver	600

Duty is leviable on the valuations shown at the rate of 8 per cent. (1,000 millièmes = £1 = £1 0s. 6d.)

SWEDEN.—The Board of Trade have compiled a list of articles which are at present prohibited to be exported from Sweden in virtue of a series of Swedish Royal Decrees issued since August, 1914. The following are included in the list:—Galvanic batteries; carbon electrodes; electro-magnetic igniting apparatus for motor ignition, detached; ferro-chrome; ferro-manganese and spiegeleisen; ferro-tungsten (ferro-voltfram) and ferro-vanadium; ferro-silicon and ferro-silico-manganese.

Copper and alloys thereof with zinc, tin, or other non-precious metal, such as brass, bronze, German silver, Britannia metal, etc.; also aluminium, nickel, chrome, and antimony:—

Unmanufactured or in the rough (including refined copper produced from raw material (not from scrap) at a Swedish refinery).

Anodes of copper, copper alloys and nickel, cast, even if with ears, with or without holes.

Scrap.

Copper and alloys thereof with zinc, tin, or other non-precious metal, such as brass, bronze, German silver, Britannia metal, etc.; also aluminium and nickel. Manufactures, viz.:—

Sheets and hoops:—

Rolled or pressed, even if with sheared edges (rectangular, and other kinds).

Hammered, bent, bell-shaped, with turned-up edges, including cup-shaped materials for making cartridges, etc., provided with holes, polished or otherwise worked.

Perforated sheets, including so-called strainer plates.

Rods (even if in bundles or coils), rolled, drawn, hammered or profile pressed, but not further worked, whatever be the shape of the section.

Solder, moulded, crushed, or granulated.

Nails and rivets; also bolts, wormed or not.

Pipes and tubes, whatever be the shape of the section, even if turned on the exterior and interior.

Wire, rolled or drawn, whatever be the shape of the section, including so-called trolley wire (contact wire).

Woven wire (gauze, wire tissue, etc.).

NOTE.—So-called wire gauze (endless) of nickel, and nickel wire tissue more than 1 metre wide are not prohibited.

Copper and alloys thereof with zinc, tin, and other non-precious metal, such as brass, bronze, German silver, Britannia metal, etc.:—

Wire twisted into cords or cables, not insulated.

Wire furnished with sheath of lead or other metal, with or without armouring, even if in combination with other materials; also electric cables or lines with similar sheaths, with or without armouring.

Wire insulated with rubber, gutta-percha, etc., even if in combination with other materials; also electric cables, lines, and cords insulated in this way.

Wire insulated with textile materials, paper, asbestos, or varnish, even if in combination with other materials; also electric cables, lines, and cords insulated in this way.

Wire, electric cables, lines, and cords insulated in any other way.

Rubber in various forms, viz.:—Rubbered plaster; rubber articles for medical or hygienic use; raw rubber, gutta-percha and balata, also so-called reclaimed rubber; rubber, in solution or in the form of paste (but not rolled into sheets or further manufactured), with or without admixture of other substances such as sulphur, graphite, and resin; also artificial soft rubber; manufactures of soft rubber, except driving and transmission belts, and except rubber boots and shoes; manufactures of hard rubber (ebonite, etc.), even if in combination with other materials; rubber waste and worn-out articles of rubber; rubber toys, and parts thereof.

Zinc:—

Unmanufactured (with the exception of zinc produced from raw material (not from scrap) at a Swedish refinery); also scrap.

Sheets, even with a coating of other non-precious metal. Wire, pipes and parts of pipes; anodes, even if provided with ears, with or without holes.

Rolled sheets furnished with holes (so-called boiler zinc). Rods.

LIGHTING CONTRACTS IN WAR TIME.

THE case of the Leiston Gas Co. v. Leiston-cum-Sizewill U.D.C., which was decided in the King's Bench Division on February 1st, raised a point of considerable interest to those who supply gas or electricity for lighting purposes. Yet it requires careful study, for some people may be tempted to quote it as an authority for propositions which are rather too wide. The facts are very briefly these: The plaintiffs, a gas company, undertook to provide columns, lanterns, and gas burners, to connect the same to their mains within the district of the defendants, a local authority, and to light, extinguish, and clean and repair, the lamps for a period of five years, in consideration of certain quarterly payments. The lamps, etc., were to remain the property of the gas company; but there was nothing in the agreement to show how the price payable was divided between expenditure on capital account and the sums to be paid for gas. The contract ran from June, 1911. In January, 1915, however, owing to an order issued by the military authorities under the Regulations for the Defence of the Realm, the lights were extinguished in the defendants' district. The defendants therefore refused to pay the sums due under the agreement from January to September, 1915. Upon being sued, they pleaded that the contract was either illegal or impossible to perform, and that it could not be enforced. Mr. Justice Low refused to adopt this contention. Having pointed out that the plaintiffs had not only to supply gas but to provide and maintain a number of lamps and certain apparatus, he said:—

I do not think it is correct to say that, because in time of emergency power is given for a competent authority to suspend the actual lighting in a given area for such times as may be considered necessary for national safety, and because such power is exercised, a provision for lighting within that area becomes unlawful.

If it "became unlawful within the meaning of the authorities" the Courts could not enforce it. He next dealt with the contention that performance had been rendered impossible. Impossibility might, of course, have excused performance, but his lordship pointed out that in one respect the contract had been performed, in that the gas company had already provided the lamps and plant. Further, they were bound to "stand by" to light the district at any moment, should the lighting restrictions be removed.

The important point to note about this decision is that the gas company had to do something more than supply gas; they had to provide lamps and other plant. In that sense, and to that extent, the contract on their side was performed. It was not a case where the gas company had merely connected up to their mains and agreed to supply gas for a period, making no special outlay on behalf of the new consumer.

It is interesting to consider what the position would be in case a lighting restriction order was applied in a case where no outlay was necessary or actually made. Suppose, for instance, an electric lighting company are under agreement to supply all necessary current to street lamps for a period of five years at so much per lamp—the lamps being the property of the local authority. In such a case, it is conceived that the question whether the lamps are lit or not is a matter which concerns the local

Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, and crossed "London City and Midland Bank, Newgate Street Branch."

NOTICE.

IN view of the recent Increase in the Postal Charges, our Subscription Rates for Great Britain and Canada will until further notice be increased to £1 1s. 8d. and £1 3s. 10d. respectively.

authority. If circumstances occur which render it impossible to light the lamps, so much the better for the lighting company. As was pointed out by Mr. Justice Low, in the case under review, they would be bound to have everything in readiness to supply the load if and whenever required to do so.

Another kind of case may occur. Suppose the lighting company are under liability to supply current for every lamp and when required, subject to a minimum consumption of, and payment for, so many units. In consequence of the restriction of lighting even the minimum may not be attained; yet the local authority will still have to pay for it.

In each of the foregoing cases it seems to be clear that the lighting authority would be to a large extent protected. The loss would fall on the local authority. But where the contract is perfectly open—the local authority being entitled to demand enough light “to light the town” (or as may be) at so much a unit, it would seem that the lighting company could assert no claim for damages if, owing to the action of the military authorities acting in the interests of the defence of the realm, no public lamps could be lit.

Having regard to recent happenings, cases of these various kinds may occur in many different parts of the country. It is possible, however, that some agreements extending over a long period contain clauses enabling them to be determined. In such instances no difficulty is likely to occur.

Copper.

COPPER prices continue to soar under the growing scarcity which has been characteristic of the market for months past, and which has seriously alarmed consumers. The speculative account is, presumably, exceedingly small, but the position of those who have uncovered contracts in standard metal has become most uncomfortable, and there is no indication whatever of the least relief coming forward for months to come. The statistics continue to indicate a perilous condition of affairs, and the scepticism which has been expressed in some quarters for months past regarding the actual position of the metal not being as represented by the available returns, is now seen to have been wholly misplaced. The fact that the world's consumption has overtaken output is, no doubt, a very regrettable circumstance, but it is blind folly for consumers to close their eyes to the patent facts in the situation, which is entirely controlled now by what appears to be a chronic state of scarcity. In America prices have reached a higher level than those ruling here, absolute famine conditions having driven consumers into the market for immediate supplies, for which they have had to pay quite extravagant figures. American producers now are in the fortunate position of having nothing but odds and ends to sell for several months to come, and this condition shows no sign of relaxing as long as the war lasts. The American exports of copper during the last few weeks have been very large indeed, and some records have been broken. It is a matter for regret that the issuing of weekly statements as to exports of copper has been discontinued by the United States authorities, though the monthly returns will no doubt appear in due course. The United States copper exports for 1915 are given as 276,000 tons against 360,000 tons in 1914, details of the principal countries' takings for the last three years being as follows, in tons:—

To	1913.	1914.	1915.
United Kingdom ...	55,682	87,556	80,985
France ...	65,826	66,326	102,400
Italy ...	18,877	26,068	44,705
Russia ...	40	425	20,456
Germany ...	145,529	88,452	Nil
Austria ...	15,539	13,809	Nil
Holland ...	77,129	68,940	1,678

The most striking feature in the above returns is the enormous increase in the French takings, the collapse in the shipments to Holland, and also the entire absence of clearances to Germany and Austria. Russia took a good deal less copper than had been expected.

The I.E.E. and Alien Enemy Members.

At a meeting of the Chief Technical Assistants' Association which was held on Saturday last, which Association comprises practically all the deputy electrical engineers of Greater London, together with certain senior technical assistants, advantage was taken of the assembly of so large a number of corporate members of the Institution of Electrical Engineers to raise the question of the exclusion of alien enemy members, whether naturalised or not.

The Association, we understand, expressed regret that no action was taken, immediately after war was declared, to exclude such members, and complains that, though it has been in communication with the secretary of the Institution of Electrical Engineers for the past six months, it has obtained little satisfaction and less sympathy. In view of the announcement that steps are to be taken by the Council with regard to the exclusion of alien enemy members, the corporate members of the Institution who were assembled at the meeting passed the two following resolutions:—

(a) The corporate members of the Institution of Electrical Engineers present at a meeting of the Chief Technical Assistants' Association of Greater London place on record their unanimous dissatisfaction at the attitude of the Council of the Institution of Electrical Engineers, inasmuch as no steps are proposed to be taken to remove persons of alien enemy origin (naturalised or not) from the roll of membership of that Institution.

(b) They also consider that the Council of the Institution should obtain powers at the General Meeting, which it is stated is to be held, to secure a ballot by post from their members; such ballot to ascertain the exact wishes of all corporate members at present resident in this country as to whether such persons of alien enemy origin should, or should not, be retained as members of the Institution, and the by-laws to be amended accordingly.

The Association also authorised the hon. secretary to state that its members are in accord with the communication from “Six Borough Electrical Engineers” which appeared in our “Correspondence” columns on January 28th, and will support the writers in any action that they may decide upon in furtherance of the principles laid down in their letter.

In this connection we may draw attention to the notice issued by the Institution of Electrical Engineers to its members, which appears in another column, with regard to the Special General Meeting. It will be noticed that the meeting is called for 5 p.m., an hour at which only a small proportion of the members can be present. Almost the same procedure was followed in the case of the meeting held to consider the new draft Articles of Association in 1911, and called forth vigorous protests. It is difficult to understand why a more appropriate and convenient hour, such as 6.30, should not have been adopted. If the Council wishes, as we have no doubt it does, to ascertain and carry out the desires of the majority of the members, it is more likely to attain that object by consulting their convenience. The fact that the members of the Electro-Harmonic Society, prior to the concert held on Monday last, by a postal vote decided that the concert should commence at 6.15, rather than at 7.30 or 8 p.m., is not without significance; and both the Civil and Mechanical Engineers' Institutions are commencing their meetings at 5.30 or 6 p.m.

Another point, of considerable importance, is the fact that many of the members who feel most deeply on the subject of alien enemy members—not only the rank and file, but also men of prominence in electrical engineering—are convinced that if they take any overt action against alien enemies, the latter will eventually find ways and means to strike at them, and in that thought they will not appear at any meeting, or vote in any way except by secret ballot. This, no doubt, explains the demand of the above-named Association for a postal ballot.

No provision is made in the existing Articles for the taking of such a ballot except in the case of the election of the Council; no doubt the authorities are chary of spending £20 or £25 on such a vote, but surely this is a trifle compared with the importance of obtaining the true opinions of the majority of the members, which can never be done at any general meeting. This question, however, cannot be dealt with at the special meeting, as 14 days' notice must be given.

The Italian Electro-mechanical Industry.

THE first official step in connection with the scheme for securing the emancipation of Italy from the German yoke in the electromechanical engineering industry was taken at Milan, on January 15th,

when Signor Guido Semenza, President of the Associazione Elettrotecnica Italiana, delivered before the members of the Association the first of a series of lectures which are to be given by way of propaganda throughout the country in favour of the development of the native industry and the definite exclusion of the Teutonic element in the future. Very appropriately the title of the address was chosen: "Dai V.D.E., all' A.E.I."—"From the Verband Deutscher Elektrotechniker to the Italian Electrotechnical Association." Taking as the starting point the fact that the rules and standards of the German Verband have hitherto prevailed in Italy, the President outlined the history of the native industry, and set forth the reasons why, after a brilliant beginning, it had to surrender its arms in face of foreign competition—the expansionist German policy, together with the irrationality of the protection afforded by the import duties and the hostility in the air, since the position in Italy in the past had been dominated by the fetish for foreign goods. When the war broke out it was found how profoundly German influence had taken possession of the Italian market, and the Association had therefore assumed the task of seeing whether it would not be convenient to promote an agitation so that the electromechanical industry might attain to that development which was its due. The manufactures of the industry were precisely those which utilised hydraulic power, which was to-day a very important branch, as it supplied the Italians with motive power. But serious difficulties stood in the way of progress, including those of the import duties, which, instead of dealing with heavy machines according to weight as at present, ought to be applied to them on an *ad valorem* basis.

The next duty of the Association, the President proceeded to explain, would be in the direction of endeavouring to persuade the Government, the provincial authorities, the town councils, and the large companies, that it would be appropriate to give a clear preference to machinery constructed in Italy. It was necessary for the machinery and materials to be of high quality and to be able to vanquish foreign competition. There had, however, hitherto been very little co-operation between science and industry in the country, whereas the German industry had reached its present degree of perfection by the application of science to all industrial processes. The Association intended in a short time to issue Italian rules and standards for the construction of machinery, which would have the effect of improving the types of machinery made. These rules, the President concluded, would be known as those of the A.E.I., and would be in opposition to those of the V.D.E., if assistance were rendered by the Government, the professors, the consulting engineers, and the manufacturers.

Telegraph Wires over Roads.—The case of the Postmaster-General v. Hutchings, which we report elsewhere in this issue, involved the discussion of an interesting point as to the right of the Postmaster-General to suspend telegraph lines over roads. The facts were very simple. He required to suspend lines over a building estate at Salford, across which there were certain public roads which had not been taken over by the local authority. The owner of the estate having objected, the matter was referred to the County Court Judge, who awarded that the Postmaster-General should pay £5 a year for the privilege. On appeal to the Railway and Canal Commissioners, this decision was reversed, the Court holding that for the suspension of wires over the public roads, no compensation was payable without proof of actual damage, and that in so far as his rights as an "adjoining owner" were concerned, the landowner would have to avail himself of the remedy given by Sec. 12 of the Telegraph Act, 1863. This decision applies to telephone as well as to telegraph wires, and it seems to accord with justice and good sense. It is difficult to conceive what harm is occasioned to anyone by the mere suspension of a light wire well above the surface of a road. If there is any technical wrong done, it is amply compensated by the fact that the extension of the telephone system is a boon to the public.

ELECTRICITY SUPPLY DEVELOPMENT IN A STRAGGLING INDUSTRIAL AREA.

By LEWIS W. DIXON, A.I.E.E.

I HAD the pleasure a few years ago of describing in the ELECTRICAL REVIEW a somewhat intricate overhead system in Dowlais in the area of the Merthyr Electric Traction and Lighting Co., Ltd., for the purposes of private and street lighting supply.

Since then another extensive development has been carried out by the company, to link up all the colliery towns

FIG. 1.—MAP OF AREA OF SUPPLY.

in the area of supply for lighting and power purposes. The object of this article is not to lay claim to any particular engineering feat, but to show what high-voltage transmission at a moderate cost can do in industrial areas, which may prove of interest to similar undertakings that have a portion of their area undeveloped.

For some years the Merthyr Co. devoted their attention solely to the tramway, lighting and power business in the

FIG. 2.—ROTARY CONVERTER PLANT.

districts of Merthyr and Dowlais only; but as time went on the inhabitants of the lower districts of the borough, which are situated in a wide valley some eight miles in length, were constantly approaching the company to introduce electricity supply there also. In 1912 it was decided

to erect an 11,000-volt three-phase transmission line between Merthyr and Treharris, and to erect transforming stations and provide a low-tension distribution system in Merthyr Vale, Aberfan, Treharris and Quaker's Yard, and subsequently to Troedryhiw as well. A periodicity of 25 cycles was adopted to enable the company to effect a junction with the South Wales Electrical Power Distribution Co. at Trelewis, which took place in March, 1914.

A rough map of the area of supply, fig. 1, shows the principal places served and a few views will serve to show

FIG. 3.—STEP UP TRANSFORMERS.

some of the essential features of the development. Figs. 2 and 3 show rotary converter and step-up transformer plant supplied by the British Thomson-Houston Co.

Special Plant.—The design of the rotary converter is worthy of mention, as it can be worked with excellent regulation when supplying D.C. to A.C., a direct-current booster being used to counteract the D.C. bus-bar variation, in order to keep the A.C. voltage constant. I do not believe there are many machines of its kind in the country, and the design certainly does the makers credit. The step-up trans-

FIG. 4.—AERIAL 11,000-VOLT SWITCHING OR SECTIONING STATION.

formers are three-phase, oil cooled, with half-voltage tappings on the low-tension windings for starting rotaries from the A.C. side, if required.

Transmission Line.—There is nothing very special about the transmission, except that it is probably one of the most exposed lines in the country. It had perforce, on account

of wayleaves and the lie of the mountain, to be erected on the summit for two-thirds of its length (a distance of about 5 miles), and could not be in a better position for catching the full force of westerly and south-westerly winds, being at an altitude of some 1,500 ft. in places.

The exposed position of the line can be better realised by referring to figs. 4 and 5. The conductors are only .085 sq. in.

FIG. 5.—POLE LINE CROSSING DIFFICULT COUNTRY.

in section, but the insulation, including a piece of underground cable, is such that the line can be converted to a pressure of 22,000 volts, if necessary.

Trouble was first experienced by conductors becoming forcibly detached from the insulators, and was overcome

FIG. 6.—TYPICAL SUB-STATION.

by using No. 8 s.w.g. check binders in addition to the ordinary chaffer binders.

It is, perhaps, worthy of notice that the line was very little the worse for the hurricanes that blew on Boxing Day and January 1st last; a few poles were blown out of the perpendicular, the force of the wind being phenomenal.

A continuous copper earth-wire runs the whole length of the line, and is grounded, by request of the Board of Trade, at every fifth pole. All ironwork, stays, &c., are bonded to this earth-wire, and, should a line fall on a cross-arm, the tripping-out is instantaneous, which has been proved from experience.

Commercially, the development has been successful. The Welsh collier likes plenty of light, and there are over 300 consumers connected to the various networks.

Sub-stations.—Fig. 6 shows the standard type of building adopted by the company, with switch-chambers and lightning arresters in the top story.

All the high-tension switchgear is the sheet steel type made by Messrs. A. Reyrolle & Co., Ltd., which, so far, has given every satisfaction.

Transformers are provided in duplicate, and are all three-phase, oil-cooled, and made by the Brush Co.

There is every prospect of an increased demand, and it is possible that more rotary plant may be installed at Merthyr to deal with the tramway and lighting load in the main town of Merthyr. All this development work, as in the case of Dowlais, &c., was designed and carried out by the writer and staff.

In conclusion, it may be of interest to mention that the company's generating station is built on the site of the old Penyarden Iron Works, where the first steam locomotive to run on rails was made for goods traffic by Richard Trevethick some 106 years ago.

THE FRENCH ELECTRICAL INDUSTRY.

ABOUT a year ago the French Société d'Encouragement pour l'Industrie Nationale suggested that an investigation should be made into the question of the means to be adopted for competing with German industry after the war. M. Hillairet, with the authority which is associated with one of the founders of the French electrical industry, responded to the call, and showed that the French had no reason to be envious of their rivals from the standpoints of staff and workmen, execution, price and the quality and abundance of raw materials. It was also contended that the home market could be fully supplied by native firms without having recourse to other countries, and that, with some efforts, the manufacturers would be able to increase their exports, whilst customers, with some consideration, could reduce their imports almost to a negligible quantity. In this connection our contemporary, *L'Industrie Electrique*, recently endeavoured to prove how this result may be accomplished. The journal leaves out of account the question of carbons, the progress in the manufacture of which more than balances the French inferiority in porcelain; lamps, which are in process of complete transformation; and secondary and primary batteries, which only represent a small fraction of the foreign trade. As a consequence, the discussion is devoted solely to machines, apparatus and cables, which comprise 82 per cent. of the value of the total imports. The accompanying table gives the values for the four years ended with 1913:—

THE FRENCH TURNOVER IN MACHINERY, APPARATUS AND CABLES.

	Imports.	Exports.	Imports.	Exports.
	1910.	1910.	1911.	1911.
Dynamos...	£339,000	£128,000	£370,000	£186,000
Electrical apparatus...	481,000	212,000	573,000	369,000
Armatures and parts...	140,000	173,000	123,000	110,000
Total	£960,000	£513,000	£1,066,000	£665,000
Difference in favour of imports	£447,000		£401,000	
	1912.	1912.	1913.	1913.
Dynamos...	£353,000	£119,000	£362,000	£164,000
Electrical apparatus...	677,000	423,000	740,000	583,000
Armatures and parts...	150,000	132,000	184,000	98,000
Total	£1,180,000	£674,000	£1,286,000	£845,000
Difference in favour of imports	£506,000		£441,000	
	1910.	1910.	1911.	1911.
Cables and wire...	£9,900	£70,000	£23,000	£142,000
Difference in favour of exports	£60,100		£119,000	
	1912.	1912.	1913.	1913.
Cables and wire...	£24,000	£118,000	£66,000	£136,000
Difference in favour of exports	£94,000		£70,000	

It will be seen that notwithstanding the increase in the absolute values, the difference between the imports and exports has

remained substantially constant, being an average of £448,000 for machines and apparatus, while the difference in the average for cables and wires has been £85,000. Among the causes adduced to explain why the efforts made to break through this constant difference have not succeeded is mentioned the scarcity of labour, which becomes accentuated every year. The quality of the manufactures is declared to be excellent, and, notwithstanding the higher cost of materials, it is possible to maintain competition by accepting reduced profits, but owing to the lack of labour it is impossible to produce in adequate quantities and consequently with sufficient rapidity. It is admitted that the French are invariably beaten on the question of the period required for delivery. The same reason must be attributed as the cause of the weakness of the export figures as compared with those of German industry. The importance of this cause of inferiority arises from two facts. In the first place, the progress made is much more accentuated in the case of electrical apparatus, which is manufactured above all in Paris, where skilled labour is relatively abundant, than in the case of machines, which are generally made in the provinces where labour becomes scarce. Secondly, in regard to cables and wire, in the manufacture of which labour only plays a secondary part, there is a surplus of exports, whilst for machines and apparatus, where the proportion of labour in the cost price ranges from $\frac{1}{3}$ to $\frac{1}{2}$, the imports have the advantage. Without wishing to conclude that the scarcity of labour is the sole cause which hampers the development of the industry, our contemporary affirms that it is an important factor in the situation.

If there are left out of consideration other causes of a general kind, such as banking and commercial organisation, the question arises as to what the national resources in labour will be after the war. The results hitherto achieved will probably be reduced then owing to the voids brought about through deaths and incapacity; while, on the other hand, the labour requirements throughout the country will be increased for numerous purposes. It is, therefore, necessary to consider directly the problem of how to produce as much as possible, and even more than hitherto, with the aid of fewer workmen, and at greater cost. In the course of a lecture delivered before the Société d'Encouragement, M. H. Errault recommended the use of improved plant and the adoption of specialisation for mechanical construction; in other words, the production of standard types. What is good for the latter should also be good for the electrical engineering industry. But as soon as the electrical industry wishes to embark upon this path it is going to meet, particularly in the home market, with great difficulties and deplorable customs. Each purchaser has assumed the habit of asking for a particular machine to fulfil his special requirements, which are almost fantastic. He compels the maker to lose his proficiency and his money in undertaking perpetual investigations, to make patterns constantly, and to change his winding, which requires much time and labour, and is opposed to the use of improved machinery, rapidly producing excellent products at low prices and with a minimum of labour. Very often the maker refuses the order, and the intending customer then applies to a foreign firm, who accepts, or pretends to accept, the conditions. In the opinion of the French journal, it will be necessary to struggle with the greatest tenacity in order to bring about a change in such disastrous commercial morals.

An initial step in this direction, it is contended, should be taken by the unification of specifications for machinery, transformers and cables. Starting from three different principles—the defence of the interests of French industrialists or the interests of buyers and the scrupulous respect for scientific data—the Union des Syndicats de l'Electricité, the Association de Propriétaires des Machines à Vapeur, or the consulting engineers and the Comité Electrotechnique, have recommended conditions to be imposed upon makers. These conditions, which are far from being in agreement, are a great obstacle to the creation of standard types. If, however, an appeal be made to each of these Associations, it is considered that each will be able, without abandoning its legitimate claims, to adapt them to the needs of an industry which requires aid to overcome the difficulties which threaten it, and to place it in a position to compete on equal terms in foreign markets. Circumstances more favourable for the purpose than those now obtaining will never be met with again. Everyone feels to-day the need for sacrificing his opinions as an individual in favour of the general interest—the superior interest of France. It is to this work that the journal would like to see manufacturers devote their efforts, as it would represent, our contemporary concludes, an excellent response to the patriotic wishes expressed by M. Hillairet some time ago.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Universal Test Clips.

We have received from the L.P.S. ELECTRICAL CO., of 18, Adam Street, W.C., particulars concerning their "current-carrying" Universal test clips, which we illustrate herewith. These are particularly designed for making quick temporary electrical connections when testing telephonic, telegraphic or power apparatus.

Fig. 1 shows the No. 8 size for 15 amperes; it is made in copper, with an internal spring, and the toothed jaws, having a spread of $\frac{1}{8}$ in., are suitable for gripping either fine wire or storage-cell lugs. To attach the clip at its other extremity to the other wire, the latter is bared of insulation a little way, and the end inserted in the hole in the heel of the clip and soldered in place; the lips of the trough are then pinched over the insulation to put the strain on the latter. The heel of the clip can then be taped over.

Fig. 2 shows a 20-amp. clip, arranged for screw connection at the heel, the bared wire being secured under a washer or cleat,

FIGS. 1 AND 2.—TESTING CLIPS WITH SOLDERED AND SCREWED CONNECTIONS RESPECTIVELY.

and the adjacent lips being pinched over the insulation of the connecting cord. Standard 100-amp. clips are made, which will carry 200 amps. for a short period.

These clips can be supplied with rubber insulating covers to protect the user from shock and prevent short-circuiting with adjacent terminal clips. These covers are coloured red and black for distinguishing polarity, &c. Special lead-plated clips, with enamelled springs, are supplied for storage-battery charging.

The Premier Electric Suction Cleaner.

We were recently enabled, by the courtesy of the ELECTRIC SUCTION CLEANER CO., of 56 Victoria Street, S.W., to inspect the latest patterns of their "Premier" suction cleaner, which has been developed up to a high degree of perfection. Fig. 3 shows

FIG. 3.—GHOST VIEW OF PREMIER CLEANER, SHOWING HIGH-SPEED REVOLVING BRUSH.

the ordinary or domestic type, which is operated by a vertical motor, and is provided with a revolving brush (to pick up thread and lint) in the nozzle driven at high speed by the incoming air, a roller at the rear which is adjustable to suit the nap of carpets or upholstery, a switch in the handle, an adjustable yoke, and a variety of attachments for the many purposes for which such

FIG. 4.—MOTOR AND FAN REMOVED FROM HEAD OF CLEANER.

machines are suitable, either as suckers or blowers. The brush is here shown as if the nozzle were transparent, and is provided with curved blades upon which the air-current impinges. The motor, which is a beautiful piece of work, and is made for pressures up to

260 volts, D.C. or A.C., can be lifted out very easily, together with the fan, which has blades of a particular shape found by experiment to be best adapted to the purpose (fig. 4). The position of the switch in the handle, which has an insulating cap so that the user is secure from possibility of shock, is shown in fig. 6. Wherever possible, the metal parts are made of aluminium, and the convenience of the user has been carefully studied.

The pattern shown in fig. 6 is a novel development intended for industrial use; by means of a specially designed belt it can be

FIG. 5.—SWITCH ON END OF HANDLE.

attached to the waist of the user, leaving both hands free, so that he can use the cleaner at the top of a ladder. Alternatively he can carry it by a substantial handle. This type is particularly suitable for use in stores, warehouses, theatres, cars, &c., being extremely handy and convenient. In the main the industrial cleaner is identical with the domestic type.

The company point out that the electric suction cleaner is not a toy, nor is it an article of luxury; it has become a very necessary domestic aid, especially in these days when servants are scarce. The "Premier" is made for all voltages from 25 to 260 volts, and

FIG. 6.—PREMIER INDUSTRIAL CLEANER IN USE.

all frequencies from 25 to 133. Careful tests by independent experts show that the special form of fan blades that has been developed enables the machine to give a pressure equivalent to more than 10 in. water gauge, and in the industrial type a still higher pressure is attained. The device has proved to be exceedingly effective for switchboards, and is specially useful for cleaning filter cloths in turbine stations, as well as for many other purposes.

Commercial Vehicle Inspection.—The Electric Vehicle Committee of the I.M.E.A. is providing three cash prizes in connection with the tenth annual inspection of commercial motor vehicles, organised by the Commercial Motor Users' Association, to take place in May.

TESTING UNDERGROUND CABLES.

At the meeting of the INSTITUTION OF ELECTRICAL ENGINEERS on February 10th, Mr. O. L. RECORD, A.M.I.E.E., read a paper on the testing of underground cables with direct current by means of the Delon apparatus. The author pointed out that as there was no definite relation between insulation resistance and dielectric strength, it was necessary to measure the latter directly, and in order to provide against possible pressure rises, it was usual to make tests on cables in the course of manufacture at not less than twice the working pressure for which they were intended. It was also necessary to apply similar tests after laying the cables, and the Engineering Standards Committee specified that such tests should be made at about twice the normal voltage for a period of 30 minutes. In the case of cables for moderate pressures this presented no difficulty; usually a small transformer could be taken to the spot. But when cables for high pressures and of great length were concerned, difficulties arose. The apparent power, and therefore the dimensions of the transformer, increased as the square of the test pressure and as the capacity of the cable, and consequently the weight of the transformer became excessive. For example, the apparatus required to test 15 km. of 3-core cable at 6,000 volts after laying might weigh as much as 25 tons. In such cases the tests after laying were often not made, and the lack of certainty regarding the condition of the cable caused uneasiness. On this account it had been proposed to make the tests with continuous current at a pressure equal to the maximum reached in the case of alternating current.

It had been shown that the breakdown voltage for a dielectric under alternating pressure was a function of the time of application, and of the frequency employed, tending to decrease as the time was prolonged or the frequency increased; and for a given cable this reduction of dielectric strength by the application of a high-pressure test was permanent. Consequently, manufacturers were strongly opposed to the application of an A.C. test higher than the working pressure being

FIG. 1.—PRINCIPLE OF THE DELON APPARATUS.

FIG. 2.—CONNECTIONS FOR TESTING A 3-CORE CABLE WITH CONDENSERS.

repeated on cables for which they had undertaken the guarantee, and this had the unfortunate result that supply engineers were prevented from employing this method of ascertaining the condition of their mains from time to time; hence another method of testing was desirable.

Testing by continuous current had the advantage that, once the cable was charged, no more energy was expended, no matter what the capacity of the cable, provided that the insulation was good; therefore tests after laying could be carried out with apparatus of small power. Moreover, observation had shown that such tests did not fatigue the dielectric, and the period of application had no effect on the breakdown voltage. Hence, with continuous current supply authorities could repeat their tests as often as desired without objection on the part of the cable manufacturers, and at the same time they could determine the insulation resistance of all the feeders.

The Delon apparatus worked on a principle described by the author as follows:—

The essence of the apparatus is a high-tension contact-maker which charges condensers by making at each half-period a connection through a short spark between the transformer and condenser to be charged. By means of a suitable arrangement the contact is made at the moment when the electromotive force is at its maximum value, and, by means of auxiliary condensers, the voltage of one half-period is added to that of the other, with the result that finally the principal condenser is charged to a pressure double the maximum of the alternating current employed.

As shown diagrammatically in fig. 1, the contact-maker formed by a conductor, *T*, embedded in an ebonite disk, revolves round a spindle perpendicular to the plane of the disk. Four fixed brushes are placed a very short distance from the disk in such a manner as almost to make contact with the conductor when the latter passes between them. These four brushes are placed at the extremities of two diameters which are perpendicular to the axis of the disk. Two of the adjacent brushes *d* are joined together and connected to

one of the secondary terminals of the transformer. The other two brushes, *a* and *b*, are connected each to an apex of the triangular group of condensers to be charged, the other apex being joined to the second terminal of the transformer *s*.

The disk is driven by means of a synchronous motor fed from the alternating-current circuit which furnishes the high-tension current by means of the transformer. The group of fixed brushes can be placed at a convenient angle to allow of their coming opposite the moving conductor at the moment of maximum voltage; the condenser *c* to be charged, and the two auxiliaries *c*₁ and *c*₂ form a triangle.

At the outset, the synchronous motor being started, if the primary circuit of the transformer is closed the moving conductor *T* passes, say, first of all between the pair of fixed brushes *b* and *d* (+). The condenser *c* takes a charge which depends on the self-induction of the transformer and the maximum voltage of the secondary current. The other two condensers *c*₁ and *c*₂ take a charge such that the sum of their potentials *U*₁ and *U*₂ is equal to the potential, *U*₀ of the condenser *c*.

At the following half-period it is the condenser *c*₁ which is directly connected to the secondary, and as the direction of the current is changed this condenser is charged in the same direction as in the previous case. The condenser *c*₂ on the contrary, receives a charge in the opposite direction to the first. As a result the condenser *c*₂ which is the one that it is desired to charge up to a high potential, receives charges which are always in the same direction, whatever the position of the moving conductor. The quantity of electricity supplied at each contact will then charge simultaneously one of the two auxiliary condensers in parallel with the group formed by the secondary auxiliary condenser and the condenser *c*. As the time during which contact is established between the transformer and the condensers is very short, and as, moreover, the self-induction of the secondary of the transformer is considerable, the quantity of electricity that can be introduced into the system at each half period is limited, but the repetition of the phenomenon is so rapid that at the end of a relatively short time the condenser *c* reaches a potential equal to twice the maximum pressure of the alternating current. In practice the charging-up is effected in less than a minute at a frequency of 50, that is, in less than 6,000 contacts.

The word "contact" signifies the passage of the conductor past the fixed brushes and not actual contact, the closing of the circuit being always produced by means of a spark, very short and of low resistance. With such a system it is possible to reach continuous charges as high as desired by using transformers of only comparatively small power.

The author then went on to state that the whole of the apparatus could be carried on a handcart, the total weight being about half a ton, so that two men could easily wheel it. The cart contained a small switchboard, a synchronous motor and contact-maker, the auxiliary condensers and the transformer. The conductor *T* (fig. 1) was completely embedded in an ebonite disk except at the ends, and the four contacts were mounted on an ebonite carrier which could be rotated to give the brushes the correct position. The transformer was wound for 110 and 220 volts

on the primary side, and gave 15,000 or 30,000 volts on the secondary side. Hence it could be used for a continuous pressure of $2 \times 30,000 \times 1.4 = 84,000$ volts, and by increasing the primary voltage a test pressure of 100,000 volts could be attained. Apparatus for 150,000 volts could be made portable, but for higher pressures the sparking distances became too great to be dealt with on a handcart. The transformer need not be larger than 3 kw. The electrostatic voltmeter should not be carried on the cart.

Fig. 2 shows the connections for testing a 3-core cable, which takes the place of the condenser *c*. One of the conductors is connected to the lead and then to one of the fixed brushes, and the other two conductors are joined together and connected to the second brush. The two condensers are joined together and their common point is connected to one of the secondary terminals of the transformer. As will be seen, the test is made between conductors 1 and 2, and conductor 3 and the lead. In order to complete the test it is therefore necessary to make a second test, joining conductors 1 and 2 to the lead and the other two conductors to the fixed brush *b*. In actual practice the auxiliary condensers are usually dispensed with, the cable itself providing the capacity.

Fig. 3 shows the connections for a 2-core cable. In this case one of the conductors of the cable is subjected to a pressure always of the same sign and equal to the maximum positive value of the alternating electromotive force, viz., $+E/\sqrt{2}$ and the other to a pressure equal to the maximum negative value, viz., $-E/\sqrt{2}$ so that there is at any instant between the two conductors under test a difference of potential equal to double the maximum voltage, viz., $2E/\sqrt{2}$.

The same test can similarly be applied between either conductor and the lead, and cables with three or four conductors can be tested as shown in fig. 4, where the maximum pressure is established between cores 1 and 2, and the lead.

In the case of single-conductor cables, which are usually used for low pressures, a test pressure up to 100,000 volts can

be applied by connecting the core to one brush only and leaving the other idle.

For measuring the pressure, the author recommended the Abraham-Villard electrostatic voltmeter as a really practical apparatus, easy to set up and to pack in a case.

As a continuous current test does not fatigue the dielectric, the question arises whether the continuous pressure and the A.C. pressure are equivalent in effectiveness. The author quoted experimental observations showing that a continuous pressure only produced the same breaking-down effect as an alternating pressure of one-third to one-fourth its value. It had been proved possible to reduce the resistance of a fault by the Delon test sufficiently to enable its position to be ascertained by the ordinary methods. The system had been definitely adopted by several important electric supply undertakings on the Continent, and the tests could be applied at frequent intervals without harm to the cable. Tests made

FIG. 3.—CONNECTIONS FOR TESTING A 2-CORE CABLE.

FIG. 4.—CONNECTIONS FOR TESTING A 3-CORE CABLE.

with the oscillograph showed that the pressure variation was less than 8 volts in 30,000, so that the pressure was much more constant than that of a dynamo.

If the cable makers and supply authorities could agree as to the proper test pressures to be adopted, all objections to the use of the method would disappear.

In an appendix the author gave particulars of German experiments on the system, which showed a ratio of effectiveness in producing breakdown of about 1 to 2.6, compared with alternating current. A portable plant rated at 10 k.v.a. was provided with a 500-volt 50-cycle supply for the primary of the transformer by a petrol-driven alternator of 9 kw.; the apparatus was carried on two wagons, weighing in all 8 tons, and could test as much as 50 km. of cable to 150,000 volts.

DISCUSSION.

The discussion was opened by Mr. WELBOURN, who felt that some mention should have been made of the work carried out in direct-current testing by others. There was nothing new in using direct-current machines for testing networks, it was common practice 15 years ago, but fell into disuse with the growth of alternating networks for various reasons, one being the flimsy character of the D.C. high-voltage machines which were available. It had, however, been a matter of considerable thought whether there should be a reversion to direct-current testing, which was quite practicable in view of the high voltage D.C. machines now available. Transformer equipment for testing completed A.C. installations was a serious item and would be more so with the 33,000 and, possibly, 50,000-volt cables which were coming, so that some suitable alternative method, such as suggested, was wanted. But it was necessary to satisfy the user that the method was a practicable one; the 14 minutes mentioned to burn out a fault might not be practicable, but he believed that the static discharge through a puncture would give the cleanest burn-out possible. As to the nature of the current produced by the apparatus, he would have been glad to see some oscillograph records. The curve showing the relation between A.C. breakdown voltage and duration of test was exactly similar to one published in Sir John Snell's book, and prepared 10 years ago from tests on the first 20,000-volt cable made in this country. He was uncertain whether the author's remarks on dielectric fatigue would hold good with modern cables.

Mr. A. P. THORNTON suggested that more consideration should be given to the period of time in testing, as it was open to doubt whether half-an-hour was really necessary.

Mr. F. C. RAYNER said that the paper by Mr. Evershed and discussion on a similar subject contained much information as to what actually occurred in the cable. The strain resulting from direct current must be entirely different from that with alternating current, and they must still have the factory test; further, some kinds of fault would probably not be broken down with the direct-current method.

Mr. WARSON referred to some experiments carried out by himself with a view to testing a large cable at 150,000 volts with an influence machine, built on practical engineering

lines. Unfortunately, the result was not entirely successful; the machine was run in compressed air for dielectric reasons, and was built to give 1 kw. at 150,000 volts. It had 30 revolving plates 124 in. dia., and metal sectors of sheet brass, while the stator consisted of steel plates built up into units mounted on ebonite insulators—all glass being done away with. The machine was separately excited by an exciter through which the output of the main machine was controlled. In the end the machine broke down by the general disintegration of the ebonite, and he thought they had possibly neglected precautions which were not found necessary with a small machine.

Mr. WARSON said some simple means of varying and controlling test pressure were, he supposed, included with the Delon apparatus. The single-core cable testing arrangement should receive every attention as far higher pressures would be used with single than multi-core cables. The use of the apparatus seemed complicated, because the actual D.C. pressure was a variable; and the small power available for localising faults was not very convincing, but the apparatus certainly got over the transformer difficulty.

Mr. H. M. SAYERS said the author had left out one of the greatest advantages of D.C. testing, i.e., it was possible to measure the actual dielectric resistance of the cable. This was of direct interest to the man in charge of the cable network, as it gave him an indication of coming trouble before the cable broke down. The usefulness of the cable sheath was proved by experience with lead-sheathed single-phase cables; the earthed outer gave an indication of coming faults. In testing he had often found it advantageous to run the engine of the testing set slower and reduce the frequency, thus reducing the size of transformer plant required.

Mr. ROSLING said the Delon apparatus was a reasonable proposition from the cable maker's point of view, and it would indicate moisture in cables being laid better than A.C. testing. Installed cables were tested for the joints, and long lengths could be cut into sections, the final joints being made under the personal supervision of the engineer, which was the best method of ensuring a sound joint.

The PRESIDENT felt that the paper rather reflected on British cable makers. Cables underwent an A.C. test during manufacture, but after laying it was only a question of testing joints. Up to now there had been no great difficulty in testing with transformers, but when they began to use 30,000-volt cables, the Delon apparatus became of interest—for testing joints, not cables. There was no continual pressure testing under present conditions, as implied in the paper; only rarely were there accidents involving such testing.

The AUTHOR, in replying, pointed out that the title of the paper might have misled them; it was not intended as a treatise, and only referred to higher pressure cables than now in use; also, it was intended to describe a particular apparatus. He quite agreed with A.C. testing in the factory, but it must be noted that with pressures of 30,000 or 40,000 volts, there would not be the same margin of safety, and greater precautions would be necessary subsequently. He thought Mr. Evershed's paper only dealt with the first part of the curve showing relation of pressure to time of test, but breakdowns occurred in the second part. The Delon apparatus was provided with suitable resistance on the L.P. side of the transformer to vary the test pressure.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Salaries in Power Stations.

THE ELECTRICAL REVIEW for January 21st has just come to hand (after its journey of nearly 3,000 miles), and I note that Mr. Ebben, the energetic hon. secretary of the A.E.S.E., has replied to my letter and taken up the subject of power-station salaries. I am afraid he has not taken the spirit of my letter in quite the right way, for I have no personal grievance at present, and the letter was written in an honest endeavour to draw attention to what is really a most important matter. I have been in a position to appreciate Mr. Ebben's good work for the benefit of station engineers, having taken an interest in the Association since its inception in January, 1913, and also having proposed or seconded for election several of its present members.

In my letter, kindly published in the REVIEW under date of January 7th, I endeavoured to point out the unsatisfactory, and even dangerous, state of affairs existing in many power stations owing to shortage of staff, and also to put underpaid charge engineers and technical assistants on their guard in the event of central stations becoming "controlled establishments," as I have very good reason to believe that certain managers have left no stone unturned to secure the protection of the Ministry of Munitions in their self-made plight.

The Ministry of Munitions may intervene, and, being a Government department, their knowledge of electrical station matters will probably be on a par with that of other Government departments; and as the managers will not enlighten them, for obvious reasons, the position of technical assistants

may be worse than in the *ante bellum* period, for they will be treated as mere operatives in a controlled establishment.

I fully agree with Mr. Ebben when he says that station engineers must follow the lead of their managers and build up a strong association themselves, instead of waiting on the I.E.E., the B.O.T., or the Home Office; but, unfortunately, of late very little interest has been evinced in the subject, and one can only conclude that if the present apathy continues the end of the war will find station men in a very backward position with regard to their own interests. Owing to shortage of staff and the craze for cheap labour, young women are being successfully employed in power stations, and it is interesting to note that for at least seven months now an important municipal power house of some 23,000-kw. plant capacity has employed on all three shifts female switchboard attendants. Who knows but that we may see in the post bellum period managers advertising in the REVIEW for charge engineers, married men preferred, wife to act as switchboard attendant, combined salary 35s. per week of seven 8-hour shifts!

If station engineers could look ahead they would see the futility of a "wait and see" policy, even during the present European crisis, for undoubtedly this is no time for any man worthy of the name to remain an inert mass. If central station men are not required in H.M. Forces, their energies should be directed towards improving their status and conditions of employment by the honourable means at their command, and in this connection I am glad to note that the official policy of the A.E.S.E. is still against that detestable weapon of Labour—strikes.

Undoubtedly the Association has a future before it, particularly if it tackles the question of competency of engineers, for I am convinced that at present the chaotic state of the profession is largely due to there being no standard of training required, and rather than "kick against the pricks" it would be to the advantage of chief engineers to encourage the pioneer work of the A.E.S.E.

Chief Assistant.

Malta, February 3rd, 1916.

WAR ITEMS.

Copperless Machines in Germany.—About two or three months ago we referred to the Government notice issued in Germany imposing upon electrical firms the obligation to make a return of the dynamos, motors, transformers, apparatus, etc., in stock, and in which copper was used, so that the military authorities might requisition these machines, etc., as occasion might arise. In this connection a further notice of a remarkable kind has now been published. It states that the electrical firms have been constructing transformers having zinc windings for some time past, and that they are now engaged on the production of generators and motors with windings made entirely or partly of zinc and commutators of steel, for which principles have already been settled by the Union of Electrical Engineers. As doubts have arisen as to whether electrical machinery and transformers in which no copper is used come within the scope of the notice regarding the obligatory return previously mentioned, the second notice announces that this is not the case. But in those instances where copper is partly employed in the construction of machines, transformers, and apparatus the original obligation holds good. At the same time, it is stated that the voluntary notification of machines possessing no copper is admissible.

Licences for Export.—The Director of the War Trade Department calls attention to the fact that where a licence is granted for the export of prohibited or restricted goods the licence does not relieve the owner of the goods, or the consignor or other person to whom the licence is granted, from any responsibility to which he may be liable for any breach of law or regulations. It is therefore incumbent on persons before applying for licences or exporting goods to take all reasonable steps to satisfy themselves that the ultimate destination and intended use of the goods are unobjectionable. Failure to do so may involve serious consequences.

Trading with the Enemy.—The Board of Trade has appointed Mr. E. R. Moon, C.B., K.C. (chairman), the Hon. J. D. FitzGerald, K.C., Sir G. Croydon Marks, M.P., and Mr. Gershon Stewart, M.P., to be a committee to advise it on matters arising under the Trading with the Enemy Amendment Act, 1916. Mr. W. P. Bowyer is secretary to the committee, and all communications should be addressed to the Board of Trade, 38-39, Parliament Street, S.W.

Australian Preference.—It is announced that the New South Wales Government has recently had under consideration the question of preference to British manufacturers, and has decided that in the purchase of supplies for the public service of New South Wales a 10 per cent. preference shall be extended to local British or Empire manufacturers as against those of other countries.

Prohibited Exports.—The exportation of carbon electrodes for electric furnaces has been prohibited by an Order in Council.

Munitions Manufacture in Italy.—La Società Partenopea per Industrie Metallurgiche ed Elettriche is the name of a new undertaking which has lately been formed in Naples with a capital of £40,000, mainly to engage in the manufacture of war munitions.

Station Men with the Forces.—The Lowestoft T.C. reports 20 electricity works employes on active service. One, Mr. W. Smith, has fallen in action in Flanders, while 13 have received war badges.

Controlled Works.—The number of establishments controlled by the Minister of Munitions on February 10th was 2,834.

THE HIRSCH PORTABLE ELECTRIC LAMPS.

ON February 12th, MR. HIRAM H. HIRSCH read a paper before the N. of E. INSTITUTE OF MINING AND MECHANICAL ENGINEERS, describing the Hirsch lamps, which, though largely used in the United States of America, have not yet been adopted in Great Britain. The lamps have been designed for use by watchmen, and in mines, and other places where special precautions become necessary on account of the presence of explosive materials or gases. They are operated by a storage battery contained within a casing.

The hand-lamp is provided with a storage battery placed on an asbestos cushion, in a cast aluminium casing with a hinged top. The top piece is also of cast aluminium, and is provided with a hook, a reflector, and terminals for making contact with both poles of the battery. The reflector unit consists of concentric safety shells, an incandescent lamp, a safety glass, a crystal, and a switch.

The battery consists of two horizontal lead plates, each about an inch thick, placed in the bottom of an ebonite jar, and separated by wood and perforated ebonite, the bottom plate being positive. The positive and negative leads extending from the battery-plates are enclosed in glass tubing. The solidified electrolyte consists of a gelatinous substance developed by the manufacturers. The battery is provided with a vent-plug, and the top of the battery is sealed with an insulating compound. The terminals consist of antimony lead.

A magnetic spring lock is housed in the bottom casing, and a rubber cushion is placed in the bottom.

The reflector is constructed with three concentric shells, the intermediate shell being insulated from the other two and connected to the negative pole, and the other two shells to the positive pole of the battery. The distance between these shells varies at different points from $\frac{3}{8}$ to $\frac{1}{4}$ in. The shells are so arranged that if the reflector should be crushed or punctured, the current to the lamp would be cut off by the shells being short-circuited between the battery and the lamp before the lamp-bulb could be broken.

The incandescent lamp used is of the 2-volt 0.55-ampere tungsten-filament type. The safety glass consists of a piece of window glass $2\frac{1}{8}$ in. long, 1 in. wide, and about 0.05 in. thick, supported across the reflector shell behind the crystal.

The miner's lamp consists of a storage battery placed in a cast-aluminium box designed for mounting on the miner's belt. The box is supplied with a handle, and contains the necessary contact springs for making contact with the battery terminals. Through the upper part of the box an armoured flexible cord extends, the other end of which is fastened to the head-piece. This head-piece is similar in construction to the reflector of the watchman's lamp, and consists of an incandescent lamp, a reflector, safety shells, a safety glass, a crystal, and a switch. The battery is of the same construction as that of the watchman's lamp.

The weight of the lamp complete is $3\frac{1}{2}$ lb., and of the battery only $1\frac{1}{2}$ lb.

It is claimed that the storage-batteries are easily and quickly handled in charging, easy to take apart and repair when necessary, and quickly accessible. The sediment that tends to loosen from the positive plate still remains part of the plate. Jarring or upsetting the battery will not affect the plates as in batteries having thin vertical plates. Short-circuiting the battery will not injure the plates. The battery will not upon short-circuit arc sufficiently to ignite gas, black powder, &c. Immediately on short-circuit the voltage drops to zero, on account of the peculiar characteristics of the battery plates.

The solidified electrolyte always remains in contact with the plates, whether upside down or not, and when in any position will not ruin a man's clothes by the spilling of acid. The batteries will give an average light of 5 C.P. for 12 hours or more on each charge.

If the crystal and safety-glass should get broken in an explosive atmosphere, the lamp is extinguished by the safety-glass opening the circuit at the switch and thereby eliminating the risk of igniting anything explosive on account of breakage of the lamp-bulb. The lamp becomes extinguished before the bulb breaks.

The arrangement of the three shells in the reflector or headpiece will prevent any danger from the bulb igniting anything explosive if the shells should be crushed or punctured, as the shells short-circuit the lamp and the light is extinguished before the bulb is broken.

Board of Trade Inquiries.—The Board of Trade Commercial Intelligence Branch has received applications from firms in this country for makers of 2 to 30-H.P. electric motors (various voltages, D.C. and A.C.) to drive ventilating fans.

LEGAL.

ELECTRIC GENERATOR CO. v. JACKSON.

On February 10th, in the West London County Court, before his Honour Sir W. Lucius Sclife, plaintiffs, electrical contractors, of Sheehard's Bush Road, W., sued defendant, an electrical engineer, of Fulham Road, S.W., for £17 15s., the price of an electric motor and starter which the defendant had hired and had retained.

After hearing the evidence, his Honour said that, allowing defendant credit for half of the first quarter's hire, he would give judgment for the plaintiffs for £10 3s. and costs, payable in two monthly instalments.

HERBERT MORRIS, LTD., v. SAXELBY.

As briefly mentioned last week, the House of Lords, on Feb. 8th, gave their considered judgment in the appeal by Messrs. Herbert Morris, Ltd., against an order of the Court of Appeal affirming a judgment of Mr. Justice Sargant in favour of the respondent, Mr. Fred. Albert Saxelby. The arguments were concluded on November 29th last. Their Lordships decided that the decision appealed from was right, and dismissed the appeal with costs.

LORD ATKINSON, in the course of his judgment, said that the action out of which the appeal arose was brought to restrain the respondent (1) from being concerned in the sale or manufacture of pulley blocks, hand overhead runaways, electric overhead runaways, hand overhead travelling cranes, or any part thereof, and (2) from divulging or using confidential information acquired by him whilst in their employ. In all these cases one had to ask oneself what were the interests of the employer that were to be protected, and against what was he entitled to have them protected? He was undoubtedly entitled to have his interests in his trade secrets protected, such as secret processes of manufacture, which might be of vast value; and that protection might be secured by restraining the employé from divulging these secrets or putting them to his own use. He was also entitled not to have his old customers by solicitation or such other means enticed away from him; but freedom from all competition *per se* apart from both these things, however lucrative it might be to him, he was not entitled to be protected against. He must be prepared to encounter that even at the hands of a former employé.

Turning to the facts to ascertain what in fact it was that the appellants here sought protection against, his Lordship mentioned that the plaintiffs were very successful manufacturers of the particular class of machinery he had referred to. They had specialised in it—standardising many parts common to different types of machinery. Though they made some other machinery, this kind constituted three-fourths of their output. In this manufacture they appeared to be the premier firm in England. Their business was very extensive. They had branch offices at London, Manchester, Birmingham, Leeds, Sheffield, Newcastle, Cardiff and Glasgow. They had a traveller in Ireland but no office. Their regular and apparently principal customers, as appeared from the evidence of their managing director, Mr. H. Morris, were the Admiralty, the War Office, the Government Ordnance Factory, numerous foreign and Colonial Governments, railway companies both at home and abroad, and more recently the Aircraft Department and the torpedo factories. No other customers were named. There was nothing to show that Mr. Saxelby ever came into personal relations with any of the officers of these departments or undertakings, or that through his acquaintance or personal influence with any of them he might be able to divert their custom away from the plaintiffs to another firm. In his opinion there was no danger whatever of anything of that kind, and the question of enticing away of customers might be put aside. The appellants, moreover, had thoroughly organised their business, both on the manufacturing and commercial side of it. They had got up and arranged in an elaborate, careful and systematic manner, a large number of charts and drawings called L sheets, comprising tables and indicating the composition and dimensions suitable for particular jobs. Mr. Justice Sargant found that the information there contained was so detailed and minute that it would be impossible for any employé to carry it away in his head. It was claimed, however, by the appellants, that this organisation and general method of business were trade secrets which the defendant was not entitled to divulge to another, or to use his knowledge of them in the service of any persons other than themselves; but he could not get rid of the impressions left upon his mind by his experience on the plaintiffs' works. They were part of himself, and in his Lordship's view he violated no obligation arising from the relation in which he stood to the appellants by using in the service of some person other than they, the knowledge he had acquired of their scheme of organisation and methods of business. Up to the time that the respondent left the service of the appellants in 1913, his whole engineering training was connected with the manufacture of these four special machines. He said he had tried to get employment as a general engineer and had failed, and he was therefore obliged, being unable to live in France, to take service with one of the appellants' rivals.

His Lordship agreed with the view of the Court of Appeal, that although the agreement might be of some advantage to the plaintiffs as restraining competition, yet it was not reasonable when viewed from the point of view of the defendant or of the public in general. It was not reasonable to require the defendant to put aside all the skill and experience that he had acquired during the period that he had been in the plaintiffs' employment and to begin life afresh. Accordingly the appeal must be dismissed with costs.

LORD SHAW'S judgment, which was read in his absence by LORD ATKINSON, was to the same effect. He said that Mr. Morris, the managing director of the plaintiff company, very candidly admitted that the real object of the plaintiff company in imposing the restraint was to preclude competition on behalf of the defendant after he had left the company's employment. The company objected, he said, to skill and knowledge acquired in its service being put to the disposal of any trade rival, and the skill and knowledge he referred to was the general skill and knowledge which an employé of any ability must necessarily obtain as opposed to knowledge of any matter and skill in any process in which the company could be said to have any property at all. He was clearly of opinion that the restraint was in no way required for the plaintiffs' protection, and was therefore unreasonable and bad in law.

LORD PARKER OF WADDINGTON, in concurring, pointed out that it had been laid down that all restraints on trade of themselves, if there was nothing more, were contrary to public policy, and therefore void. It was not that such restraints must of themselves necessarily operate to the public injury, but that it was against the policy of common law to enforce them, except in cases where there were special circumstances to justify them. The test, he thought, was this: that for the restraint to be reasonable in the interest of the parties it must afford no more than adequate protection to the party in whose favour it was imposed. He agreed that the appeal failed.

In this judgment LORD SUMNER expressed his entire concurrence. The appeal was accordingly dismissed, with costs.

MUNITIONS COURT CASES.

At the Edinburgh Munitions Tribunal, William Cowie, employed in driving an electric crane for Messrs. Redpath, Brown & Co., Albion Road Steel Works, applied for a clearance certificate on the ground that the work he was engaged on was dangerous. A representative of the firm stated it was an overhead electric crane that Cowie was engaged on and it was a perfectly simple job. The Tribunal refused to grant the certificate, the Chairman advising Cowie to give the work a fair trial.

In a case before the Oldham Tribunal, a labourer employed by a firm of electrical engineers applied for a leaving certificate on the ground that his wages were too small and he had another job offered him. He received 23s. for working 53 hours, and had a wife and children. He now had 30s. offered to do other work in a mill. The firm said the man's average wages during the past four weeks had been £1 8s. 3d. The application was refused, the President holding that the man was fully employed on munitions.

Before Sir Robert Wallace, K.C., sitting at the London and S.E. Division General Munitions Tribunal, a well-known firm of electrical instrument manufacturers were the complainants, and a firm of builders and contractors were the respondents. The CHAIRMAN said that the plaintiffs' workmen were clearly engaged in war work, that a number of them left without the consent of their employers, that they had not obtained from the legal tribunal a certificate of discharge, and that they had all been taken into the employment of the respondents. An offence had been committed. The Chairman said that, having heard all the witnesses called by the respondents and the men, they did not want to hear any evidence on behalf of the complainants. In regard to four of the men, the offences against the Act were deliberate and not done in ignorance, for it had been admitted by respondents' manager that when the first man applied for work questions were asked, and the manager was informed that no leaving certificates had been obtained, also that the men had been engaged on war work. A former employé of the complainants was the medium through whom the men were engaged. The Chairman described it as a very bad case indeed, and fined the respondents £15 in each case, and granted 10 guineas costs.

Re BRYANT TRADING SYNDICATE, LTD.

A CURIOUS story was told to Mr. Justice Neville in the Companies' (Winding Up) Court, on Tuesday, February 15th, when Mr. Wm. East, a retired brewer living at Wimbledon, applied under Sec. 33 of the Companies' Act, to have his name removed from the register of shareholders in the Bryant Trading Syndicate, Ltd.

MR. PRESTON (for the applicant) said the Bryant Trading Syndicate, Ltd., was now in liquidation, and it was alleged that his client was the holder of 50 £s. shares, with only £1 paid. Under these circumstances, he made this application, and his case was that the company had no business, and never had any business, to put his name on the register. Mr. East was apparently interested in electric lamps, and in 1908 he heard from a friend that this company was producing a very good lamp. On that account he went with his friend to see it. Apparently there were none for him to see. But he paid £1 for lamps to be sent to his residence that he might test them. He was invited to take shares in the company, and was, indeed, induced to sign an application for 50 shares. But Mr. East stipulated that this application was not to be used until he had tested the lamps. In fact, no lamps were ever sent to him, although he wrote to the company two or three times. Upon that he dismissed the matter from his mind. No notice of allotment was ever sent to him, and until the company went into liquidation, and this demand was made upon him, he only received one communication from the company. That was about four years ago, and as it seemed to indicate that he was being treated as a shareholder, he wrote to the company saying that he was no such thing, and the communication must have been sent to him in error. Apparently there was a resolu-

tion on April 9th, 1908, allotting the 50 shares. He submitted (1) that Mr. East's application was subject to a condition that had never been satisfied; (2) that even if there had been an unconditional application, the company never communicated the fact of the allotment to Mr. East.

MR. WALTER EAST went into the witness box to be cross-examined by Mr. Hewitt, K.C., for the liquidator of the company upon the affidavit he had made. He said that when he went to the office of the Bryant Trading Co. in April, 1908, he did not intend to subscribe for shares. But the managing director, Mr. Metcalfe, whose "Geese were all Swans," asked him to take up 500 shares and "practically compelled him" to apply for 50. He said he would not touch them unless the test was satisfactory. But Mr. Metcalfe said the shares were going so fast that he could not guarantee that they would be allotted if the application were deferred, and he made a conditional application accordingly. After the non-delivery of the lamps he did nothing to secure the repayment of his sovereign.

MR. W. F. MOORS, secretary and sales manager of the company from 1908 until 1911, said that he remembered the shares being allotted to Mr. East, but could not remember the notice of allotment being sent out in this particular case. He had no doubt the notice of allotment was sent out.

MR. JAMES, secretary of the company from 1911 to 1915, said that he first sent out notices to shareholders who had not paid for their shares in full in 1911. About two years would be sent out afterwards asking for the unpaid balance on the shares. He could not remember any shareholder writing back to deny his liability.

MR. HEWITT submitted that the memory of Mr. East was not to be relied upon, and that there was ample evidence to show that he had, or should have had, the presence of his name on the register of shareholders brought home to him.

HIS LORDSHIP, in giving judgment, said this was rather a curious case, which had arisen owing to a peculiarity in the management of a company which he had never come across before, and which he should recommend other companies not to follow, *i.e.*, the company never made any calls on their shares, but occasionally applied to shareholders for something on account of the value of the shares they had taken. Of course they had no right in any of these cases to demand anything from the shareholders, because the liability of shareholders was dependent on the making of calls in the first instance. The question turned on an interview of April 8th, 1908. With regard to that he was not satisfied that Mr. East's application was conditional upon a test of the lamps. Moreover, he had, if he had chosen to read it, received notice over and over again, that he was on the register of shareholders in the company. He was sorry for Mr. East, but saw no reason to rectify the register. The summons would be dismissed, but without costs, because the trouble had been caused by the way in which the company had acted in making no calls, but merely writing round for subscriptions.

ELECTRICAL CONTROLLER FINGERS.

AN action by Messrs. Allen West & Co., Ltd., of Lewes Road, Brighton, against the British Westinghouse Electric and Manufacturing Co., Ltd., of Norfolk Street, Strand, claiming an injunction for alleged infringement of a registered design was heard by Mr. Justice Astbury in the Chancery Division on Thursday, February 10th. Plaintiffs said they were the registered proprietors of the copyright in a design of controller fingers for electrical machinery, and the defendants had without their licence or written consent infringed the copyright, and as an instance of the infringement the plaintiffs referred to the supplying by the defendants to the Admiralty of controller fingers for use on machinery installed in a boiler shop in Portsmouth Dockyard in the latter part of 1914 or the beginning of 1915. Defendants denied the alleged infringement, and said the design was invalid, and it was not new or original at the date of registration. They pleaded prior publication and prior general common knowledge. They said the design had been published in this country prior to the plaintiffs' registration by the publication of a drawing by Robert Friedrich Baerlooker, of the Westinghouse Works, Trafford Park, defendants' engineer, in 1909, and by the publication of the drawing by the defendants to their workmen in the ordinary course of their trading between March, 1909, and March, 1910. Defendants also said the design of the plaintiffs had been anticipated by the manufacture and sale by the defendants to the Cargo Fleet Iron Co., Middlebrough, in 1910, of 17 controllers with controller fingers. Defendants had a motion to expunge the plaintiffs' design from the register of designs.

Mr. Colefax, K.C., and Mr. C. Terrell appeared for the plaintiffs, and Mr. Walter, K.C., and Mr. J. H. Grav for the defendants.

HIS LORDSHIP gave judgment, and said the encouragement given by the patent law to new conditions and original designs was primarily to advance our industries and to keep them at a high level, but in administering the provisions of the laws, it was most important to bear in mind that they were not intended, and should not be allowed, to paralyse or impede the natural growth and development of manufactures which they were intended to benefit. He thought that the present case rested upon the question whether the difference in the registered design of the right-angled support finger was or was not sufficient to make it an original design within the meaning of the Act, or whether, on the contrary, it was not an ordinary and natural alteration of the shape of a known article for the purpose of fitting it into a case or apparatus in which it was desired that it should work. He thought that the pattern of the finger in the anticipation could, if it was reasonably adjusted, be made to fit into a space as small for all practical

purposes as the finger shown in the original design. The alteration was not sufficient subject matter for a registered design, and the design in question was therefore not valid, and there must be judgment for the defendants in the action and motion, with costs.

A stay of execution was granted on the application of Mr. Terrell.

PRICE V. HAMMERSMITH BOROUGH COUNCIL.

IN the King's Bench Division, on Monday, February 14th, Mr. Justice Rowlatt gave judgment in a case that had occupied his attention for some days in which the plaintiff, Mr. Edward Price, proprietor of the Royal Laundry, Goldhawk Road, Shepherd's Bush, W., sued the Hammersmith Borough Council to recover compensation in respect of a fire that occurred on his premises through, as he contended, the fault of the defendants' electrical installation. The defendant denied liability. After hearing the evidence, MR. JUSTICE ROWLATT said that in this case the plaintiff sought to recover damages in respect of a fire that broke out in a laundry, and the defendants were sued as a public corporation which supplied the laundry with electricity. It appeared that the fire broke out in the sorting room of the laundry where the service main—which belonged to the defendants and for which they were responsible—entered the fuse-box and meters, which were connected at a point where the plaintiff's own wires began, and for which the defendants were not responsible. The first question was whether the fire broke out in the service main belonging to the defendants on the defendants' side of the fuse-box? On that question, and on that alone, he had been addressed by counsel.

His Lordship concluded his judgment as follows:—"I think it has not been made out that the plaintiff's fire commenced in the defendants' service mains. I do not think that the plaintiff has proved his case. It is a fire which must remain, in my judgment, one of unknown and mysterious origin. It has not been shown to me how it happened. I know quite well where there is apparently no external cause of a fire, and there is electricity in the place, and the service main is found to be burned, that one is apt to say that it must have been the electrical current which started this; but this is only guessing, and I do not think that I am entitled to adopt that intellectual process. The plaintiff has not reasonably convinced me by the evidence that this fire was caused by the electrical main, and I cannot say how the fire began. Under these circumstances, the onus is on the plaintiff, and I must say that he has not proved his case, and, therefore, there must be judgment for the defendants, with costs."

SUB-STATION ATTENDANTS.

IN our report of this case on page 170 last week, Mr. Bowden was incorrectly represented as saying that "no special skill was required" for the work in question; the word "no" should have been omitted.

As we go to press, the following has come to hand from Mr. W. Arthur Jones (president of the Association of Electrical Station Engineers), on behalf of the Executive Committee of the Association:—

Referring to your report in last week's issue of the case before the London Munitions Tribunal between Mr. J. H. Bowden, chief engineer of Poplar, and Mr. W. J. Ebben, in which it is stated that a certificate of release was refused, it is only fair to Mr. Ebben to state that the finding of the Tribunal was that—"In view of the facts that Mr. Bowden has now promised to release Mr. Ebben as soon as the improver referred to becomes more proficient, and that overtime would be arranged on munition work, a certificate could not be granted."

We may state that this Association was mentioned by Mr. Bowden in connection with this case, and we would emphatically point out that it was purely a personal matter relating to Mr. Ebben.

As an Association we take great exception to the statement that Mr. Bowden is reputed to have made that "no special skill was required for the class of work referred to." We think that as it was necessary for Mr. Bowden to enlist the services of two of his chief assistants, and also that of Mr. Beauchamp, Chief Engineer of West Ham, at the tribunal to retain the services of Mr. Ebben, the statement to which we take exception is somewhat disapproved.

COAL MINES ACT PROSECUTION.

SHERIFF HAY SHENNAN, Hamilton, has given judgment in the case reported in our last issue.

HIS LORDSHIP finds, in regard to Hutchison, that so far as the cable was concerned, no blame attached to him, and that the course he adopted was not dangerous so long as the workmen observed reasonable precautions. The evidence showed that a course similar to that which Hutchison had taken was frequently followed in the district, and had hitherto led to no mishap if ordinary caution was observed. The plan adopted was to clear away the debris from the side of the road furthest away from the cable. As this was done, the soft material kept falling away towards that side, and by the time the men came very near the cable, it should have been possible to lift it by hand and replace it, so as to hang it on the side of the road. Hutchison warned the men that the current was on, so that they might exercise caution. That could not be urged against him as proving that there was danger. There were many unavoidable dangers in coal mining, and it was part of the duty of a careful fireman to keep on warning the men to be cautious. The Sheriff, however, considered that Hutchison, through a misunderstanding of his duty, had failed to comply with the statutory requirement

in regard to the state of the roof where the fall took place. He ought to have mentioned in his report that the roof was defective there. His Lordship therefore found this part of the charge proved, but dismissed the respondent with an admonition. From the evidence led, he found the charges against Shaw—which had also reference to the cable—not proven.

WORKMEN'S COMPENSATION.

SHERIFF MOFFATT, Falkirk, on Friday issued judgement in an action raised under the Workmen's Compensation Act by the Scottish Central Electric Power Co. against Wm. Kerr, labourer. While in the employment of the company Kerr met with an accident involving injuries to his head and back, and was paid compensation at the rate of 12s. per week. In consequence of an arrangement, Kerr accepted employment from the Scottish Central Electric Power Co. at his old rate of wages in lieu of further compensation. Proceedings were raised by the company to have it declared that his incapacity had ceased, or at least diminished, and they asked the Court to review the weekly payment of 12s. and to end or diminish the same. Kerr objected to the proceedings, maintaining that, as he had not recovered from the effects of his injuries, no order should be pronounced terminating his right to receive compensation. The Sheriff found in favour of the workman and dismissed the proceedings, finding the employers liable in expenses on the higher scale.

A BELFAST ACTION.

MR. JUSTICE GIBSON, in the King's Bench Division, Dublin, directed notice to be served on defendant's solicitors in reference to an application, on behalf of plaintiff, to have interrogatories administered in the action by Mr. A. B. Farrell, resident superintendent of the central electricity works, Belfast, against Mr. T. W. Bloxam, city electrical engineer, Belfast, for alleged slander, the words complained of dealing with the support and clamping of main feeder cables and with plaintiff's methods of work. The object of the application, it was explained, was to enable defendant to specify the cables, &c. Plaintiff's solicitor had already sent the proposed interrogatories, wishing to avoid application to the Court, but no reply had been received, except that counsel's advice was being sought.

BUSINESS NOTES.

Consular Notes.—JAPAN.—H.M. Consul-General at Kobe (Mr. R. G. E. Forster) reports that one result of the war will be to stimulate the industries of Osaka, the main part of whose foreign trade is done by Kobe. Industries, which were being slowly worked up against the competition of the imported articles, have suddenly been given a free field. To how great an extent they will profit by the occasion to establish themselves firmly against the time when they have again to face competition remains to be seen, but it seems clear that after the war importers of manufactured goods will be faced with greater difficulties than formerly. As to the effect on British trade, it is difficult to speak. The elimination of German and Austro-Hungarian competition would appear at first sight to afford a splendid opportunity, but as far as can be seen at present manufacturers and merchants in the United Kingdom have their hands too full to capture new trade. For the present, therefore, it is rather a question of how much of the old trade in machinery and metals, for instance, can be maintained.

The war has revolutionised zinc refining in Japan. Hitherto the two refining concerns at Amagasaki, near Osaka, and Miika, in Kyushu, have been slowly feeling their way. As a result of the war great activity has been shown in connection with military requirements, considerable extensions have been made, and it is anticipated that when all the works contemplated are in working order they will be in a position to deal with the whole of Japan's output of zinc ore. There was a decline in imports of machinery from £1,697,000 in 1913 to £1,342,000 in 1914. All classes of machinery shared in this decrease, which, speaking generally, was due at first to the Government policy of retrenchment, combined with the general depression, and latterly to the difficulty of obtaining supplies from Europe. The making of machinery in Osaka and Japan generally is increasing yearly. To give a few instances, the demand for oil and gas engines is met largely by locally-made engines; while in machine pumps, water turbines, cranes, dynamos, motors, locomotives, and in many other classes of machinery, imports are feeling the effect of local competition. Since the outbreak of war the difficulty which British firms have experienced in accepting orders for prompt delivery has diverted many orders which might have been expected to go to the United Kingdom.

Bankruptcy Proceedings.—J. TAYLOR PEDDIE, described as an engineer, of a day's site, Strand, W.C.—An application was made last week to Mr. Registrar Linklater, at the London Bankruptcy Court, for approval to a scheme of arrangement recently entertained by the creditors. Mr. Egerton S. Grey, Official Receiver, reported that proofs of debt amounting to £9,744 had been lodged, and the proposal provided for the payment of a composition of 5s. in the £ on claims of £2,748, and for

the absolute release and discharge of liabilities to the amount of £7,472. The Official Receiver opposed the application on the grounds (1) that it was not the actual arrangement which debtor was seeking to make with his creditors; (2) that the assets were not equal in value to 10s. in the £ on the amount of the liabilities; and (3) that he had brought on his insolvency by rash and hazardous speculations. Mr. E. W. Hansell, who appeared in support of the application, pointed out that although the releasing creditors represented the majority in value of the debts, they were only a few in number, and were confined to Stock Exchange claims in respect of differences, whilst the creditors who were to receive the composition were 21 in number. His Honour, after hearing evidence, approved the scheme of arrangement, and annulled the order of adjudication.

ALFRED SLATTER, consulting electrical engineer, Carlton House, Westminster, S.W.—An application for an order of discharge was made, on February 8th, to Mr. Registrar Linklater, at the London Bankruptcy Court. Mr. Egerton S. Grey, Official Receiver, reported that the applicant failed in June, 1912, with provable claims £2,380, and assets valued at £198, but only £10 had been received in respect of the estate. The only offence reported by the Official Receiver was the insufficiency of assets to equal in value 10s. in the £ on the amount of the unsecured liabilities, and his Honour granted a discharge, subject to a nominal suspension of three weeks. Order entered accordingly.

G. E. BONNER, Ashcroft, 103, Fox Lane, Palmer's Green, Middlesex, electrical engineer.—The first meeting of creditors was fixed to be held on February 11th, at 14, Bedford Row, W.C., when the statement of affairs showed liabilities amounting to £210, and assets estimated to realise £63; after deducting preferential claims, the estate disclosed a deficiency of £147. The debtor prior to November, 1914, had for 17 years been engaged as stockbroker's clerk, but on the outbreak of war his salary was considerably reduced, and he took up an agency with a firm of electric lamp manufacturers on commission terms, but did very little business. In November, 1914, the stockbrokers terminated his employment, and from that time until last December his only employment was the agency for the lamp firm. Debtor stated that his failure was due to loss of employment and heavy interest to money-lenders. The matter remains in the hands of the Official Receiver.

Book Notices.—*Sell's Directory of Telegraphic Addresses.* London: Business Directories, Ltd. Price 25s.—The 1916 edition of this useful business directory has just appeared. In the course of its 2,600 pages it gives an alphabetical list of firms in London and the country, with their telegraphic addresses and telephone numbers; an index to telegraphic addresses; a classified trades list of the United Kingdom; cable addresses of British Empire overseas and foreign firms; telegraph tariffs, and other information. All new telegraphic addresses and alterations in postal addresses received from the Postmaster-General up to January 1st this year are included. The classified trades list contains more than 3,400 separate trade headings.

"*Journal of the Institution of Electrical Engineers.*" Vol. LIV. No. 256. February 15th, 1916.—This issue contains a paper on "The Principles of Modern Printing Telegraphy," by Mr. H. H. Harrison. There is also a "Sixth List" of 65 members of the Institution serving with H.M. Forces.

"*The Practical Engineer's Electrical Pocket Book and Diary for 1916.*" London: The Technical Publishing Co. Price, cloth, 1s. 4d., post free. The new edition has been brought up to date, especially in connection with the specifications for copper conductors, particulars of instruments and apparatus, electric furnaces, and standards for electrical machinery; and new sections have been added relating to telephones and to first aid in case of accident. It contains a remarkably varied and comprehensive amount of information.

"*Science Abstracts.*" Sections A and B. Vol. XIX. Part I. January 31st, 1916. Index to Vol. XVIII. Sections A and B. London: E. & F. Spon. Price 1s. 6d. each net.

"*Lockwood's Builder's and Contractor's Price Book for 1916.*" London: Crosby Lockwood & Son. Price 4s.

"*Telegraph Engineering.*" By E. Hansmann. London: Constable & Co., Ltd. Price 12s. 6d. net.

"*The Universe and the Atom.*" By Mr. Erwin. London: Constable & Co., Ltd. Price 8s. 6d. net.

"*Directory of British Manufacturers for Russian Trade.*" London: Russo-British Trade Exchange, Ltd. Price 5s.—This directory, which has been edited by Mr. B. A. Lenski, is printed in the Russian language for circulation in Russia. It consists of 400 pages, with trade headings in Russian and English. It has received the support of representative electrical manufacturers, whose advertisements are suitably illustrated and are well produced. We hope it will prove of some assistance to our firms who are trying to gain a hold on the Russian market.

Trade Announcements.—THE ELECTRICAL SUPPLIES Co. are opening a Manchester office and stores at 40, Victoria Buildings, Victoria Street, Manchester (Telephone No.: "City 5794"). Mr. R. L. Bateson has been appointed manager of the branch, where stocks of lamps, cables, fittings, carbons and accessories will be held.

THE HOLMQUIST ELECTRIC CO., 1911, LTD., and the RADIO ELECTRIC LAMP CO., LTD., have removed to more commodious premises at 17, Great Chapel Street, Oxford Street, W. Telephone: "4278 Regent."

MESSRS. CAVE & HIGGIN, LTD., of 265, Deansgate, Manchester, have altered their title to HIGGIN, LTD., and all communications should be so addressed.

Liquidations.—**OIL-FLAME FURNACE CO., LTD.**—A meeting will be held at 11, Ironmonger Lane, E.C., on March 14th, to hear an account of the winding up from the liquidator.

GLOBE ELECTRIC CO., LTD.—Creditors should send the usual particulars to Mr. G. E. Corfield, 119, Finsbury Pavement, E.C., the liquidator, by March 14th.

Patent Restoration.—**THE ADJUSTABLE COVER AND BOILER BLOCK CO., LTD.** has applied for the restoration of Patent No. 6,831, of 1911, granted to J. R. Hannam, for "Improvements in or relating to side flues and downtakes for boilers."

LIGHTING AND POWER NOTES.

Accrington.—**PLANT EXTENSIONS.**—The Electricity and Health Committees have given instructions for a scheme to be prepared and tenders to be obtained for dealing at the minimum of cost with the present difficulties at the destructor and electricity works. The proposal includes the erection of a new chimney and flues and the provision of a new tubular boiler for the destructor, thus releasing two Lancashire boilers for the electricity works. The scheme is estimated to cost between £5,000 and £6,000.

Australia.—Although the Fremantle (W.A.) Council recently decided to reject the Government's offer to supply electricity in bulk from the Perth power station, it is understood that the Fremantle Tramway Board has decided to accept the offer, which includes delivery of energy at the Board's main sub-station at East Fremantle, at 85d. per unit. The agreement is proposed for 50 years; electricity may be resold to other local authorities at not more than 2s. a unit and to the Government at not more than 1½s. per unit. The Tramway Board was influenced in its decision by an expert report by Mr. Curle Smith, showing a profit margin in favour of the Government supply.—*West Australian.*

Mr. Forbes Mackay, reporting on the delay in supplying North Sydney (N.S.W.) with electricity, pointed out that this supply could be available in 10 days after receiving the submarine cables to cross the harbour. It is understood that the cables have been shipped, and it is hoped that the supply will be ready by the end of the month.

Barnes.—The contract for the maintenance of the storage battery having expired, the Tudor Accumulator Co. has asked for a renewal for a further period of 10 years on the same conditions, but no security would be deposited. The matter was adjourned until the next meeting.

It was decided to make arrangements for a supply of electricity to the houses on the Vine Cottage estate as soon as they are ready for occupation.

Bradford.—A small Sub-Committee of the Guardians has been deputed to consider the installation of electricity at the Bowling Park Colony.

Bridlington.—**DESTRUCTOR SCHEME.**—The L.G.B. has disapproved of the Corporation's scheme for the erection of a refuse destructor at the electricity works.

Brighton.—**SUGGESTED PRICE INCREASE.**—The Electricity Committee has decided to adhere to the proposal to raise the maximum price of electricity to 5½d. per unit, with reductions after the first 1,000 units, but suggests that the charge for power should be raised ½d. per unit on the first 2,000 units. Consumers outside the borough are to be charged 6½d. per unit. It is also proposed for the improvement of the financial position of the electricity undertaking, to transfer to rate account certain annual liabilities on capital expended in plant for street lighting in unremunerative areas.

Chester.—The Waterworks Co. has under consideration the substitution of electric power for steam with a view to reducing the working expenses.

Church Stretton.—**PROV. ORDER.**—The local Electricity Co. has applied for a provisional order in respect of the urban district of Church Stretton and the parishes of All Stretton and Little Stretton.

Continental.—**SPAIN.**—A joint stock electric supply company, styled the *Energica Eléctrica de Asturias*, is being formed at Ujo, in the Province of Asturias. It is intended to utilise certain waterfalls on the Aller River, totalling 6,000 H.P. The scheme is in the hands of the engineer Don Juan Rovira.

RUSSIA.—When the new Moscow central station was constructed in 1898 a three-phase, 2,100-volt distribution system was adopted, with transformer pillars where the pressure was stepped down to 120 volts. In 1907 the network was extended to the industrial districts beyond the city, and in 1910 the distribution pressure was increased to 6,500 volts, there being at the present time two 6,500-volt networks and four 2,100-volt networks. Last year the central station and cable network were further modified, with a view to increasing their efficiency.

Dublin.—The report of Mr. P. W. d'Alton, on the Corporation's electricity undertaking, indicates that the administration of the system is unduly complicated owing to the dual control by an engineer who is not a manager, and a secretary who in part manages. The engineer should be given more responsibility for the number and qualifications of people employed, and for the extension of the load and its measurement. The charges for energy, while not unreasonable for public lighting, are unduly high for private supply. Considerable reductions in the number of workmen employed at the Pigeon House are possible. The wages paid under the Department of Public Lighting appear to be out of proportion, amounting to over 16 per cent. of the gross revenue received for that service. The cost of the secretarial department is high; a general gain in economy would follow were canvassers and meter-readers placed on the engineering staff. The salaries and wages paid otherwise than from revenue appear to be unduly heavy. The coal supply seems to have become a monopoly; methods should be adopted in the future to secure competition, and the coal specification issued by the Corporation should be more rigidly drawn. The charges for interest and repayment of moneys borrowed are fair, and are being admirably met. Further capital must be expended at the generating station to provide for the demands of the winter of 1917-18, and a scheme of extension must be prepared, and estimates invited and considered, during the coming year. During the spring and summer of 1916 no efforts must be spared by the engineering staff to get the power house into proper condition to meet its winter load with existing plant. The returns of the units generated at the power house are unreliable on account of the condition of the watt meters, which must be overhauled, repaired, and recalibrated before any reliance can be placed on their readings. The Stewart engines are obsolete and extravagant, and should only be worked in emergency. The Belliss-Morcom engine wants a thorough overhaul by its makers, to render it less extravagant in steam consumption; such an overhaul will probably greatly increase its efficiency. The Richardson-Westgarth turbine should be in part reconstructed by the makers, to reduce its steam consumption. The Oerlikon turbines are excellent. The condensers of the station, which are now, and have for long been, seriously ineffective, must be put right. The older section of the boiler-house plant should be used only in emergency; it ought not to be worked as it is now on the daily load. The five large Babcock-Wilcox boilers and the Yarrow boiler should be always used for the day in, day out, needs of the station. Such a practice in connection with boilers and engines will produce a saving of the first importance in coal, labour and repairs. The present practice of using obsolete plant for the majority of the working hours of the station, and reserving modern and efficient machinery for intermittent peak and emergency loads, is to be deprecated as most extravagant.

The local Press publishes portions of counter-reports, prepared by Mr. Fred Allan, secretary to the Electricity Supply Committee, Mr. Mark Ruddle, city electrical engineer, and Mr. L. J. Kettle, deputy city electrical engineer. The whole matter will be considered at the next meeting of the Electricity Supply Committee.

The statement of accounts of the electricity undertaking for the year ended March 15th, 1915, shows that the total capital expenditure was £834,757; the total income was £105,440, as against £98,190 in 1914, and the debt charges amounted to £53,579, as against £46,069 in 1914, the surplus on the year being £1,417, as compared with £4,917 in 1914. Together with balances brought forward, the total surplus available was £10,291, from which £2,351 was placed to renewals. The total units sold were 9,519,545, as compared with 8,546,927 in 1914. The maximum demand was 7,486 kW., and the station plant capacity 12,000 kW.

Eccles.—**PROPOSED EXTENSIONS.**—With reference to the proposed electricity extensions mentioned in this column last week, it is stated that the present engine capacity at the generating station is fully loaded, and the Committee wishes to proceed with the extensions in order to use them as soon as the war is ended. Existing cables would be available for lighting purposes; the three-phase system is necessary for supplying energy to local works.

Ecuador.—The Municipality of Daule has been authorised to install an electrical plant for the public lighting of that town.

Edinburgh.—The Edinburgh Merchants' Association has passed a resolution condemning the Corporation's action in proceeding with the Portobello scheme at the present time.

Epsom.—**INCREASED PRICES.**—Owing to the extra cost of coal, &c., the U.D.C. is recommended to increase the charges for current by 25 per cent., as from March 31st next. The assessment of the undertaking having been increased from £650 to £1,285, an appeal has been entered.

Glasgow.—**WAR ECONOMY.**—Mr. Lackie reports that by deferring meter cleaning and repairs for an extra year £1,500 will be saved; also that £3,000 will be saved by delaying repairs to station plant.

Hastings.—**PRICE INCREASE, &c.**—The T.C. has been refused a loan of £500 for house services. The charges for electricity in respect of the current quarter have been increased by 10 per cent. as a temporary expedient, in addition to the 10 per cent. increase already in force.

India.—Dissatisfaction is felt in Calcutta at what are claimed to be the high prices charged for electricity to the general public, and the Corporation has adopted a resolution asking for an expert Government investigation of the matter. The public pays 8 annas and 4 annas respectively per unit for lighting and power; the Government pays less than half these rates for its supplies.

Ipswich.—**LOAN SANCTION.**—The L.G.B. has sanctioned the borrowing of £3,100 for coal-hauling plant at the generating station.

Kilmarnock.—The Corporation electrical engineer reports that he has adjusted the terms of an agreement with the Carrington and Auchlochan Chilleries, Ltd., for the supply of electricity to Annandale Pit, and that he proposed to run a new 11,000-volt transmission line from the works to the colliery, which could afterwards form part of the scheme for duplicating the supply to Troon and Irvine.

Lincoln.—The T.C. has decided to give an additional supply of current to Messrs. Clayton & Shuttleworth, Ltd.

Llanelli.—**STREET LIGHTING.**—The Electric Light and Traction Co. has made a rebate of £100 on the account of the T.C. in respect of restricted public lighting. The Council originally demanded a reduction of over £200.

London.—**HAMPSTEAD.**—The Lighting Committee has considered a report of the chief electrical engineer, with reference to the breakdown of the 1,000-kw. Westinghouse turbo-alternator on December 15th; the Committee found that the switchboard was of an obsolete pattern and incapable of dealing with the present loads, and it has authorised the engineer to issue specifications and obtain tenders for a modern switchboard. The B.C. has agreed to apply to the L.C.C. for sanction to the borrowing of £4,000 for the above purpose.

FULHAM.—After the current quarter the prices for electricity for private lighting, power and public lighting are to be increased to 4d., 1½d. and 1½d. per unit respectively, with no discount.

SHOREDITCH.—As from the March meter readings the price of electricity for all purposes is to be increased by 15 per cent. Owing to the increased cost of coal, &c., there will probably be a deficiency of £4,000-£5,000 on the year's working.

STEPNEY.—The Finance Committee of the B.C. has approved an estimate of £19,000 for two new boilers; the Council has machinery sanctions representing £16,000 in hand, and it is proposed to interview the L.C.C. with a view to utilising this sum and borrowing a further £3,000.

HAMMERSMITH.—The electricity works are at present insured against fire and aircraft risks to the amount of £45,588; the Electricity Committee has authorised an extension of the policy against aircraft for a further £45,588, representing an insurance against fire of £45,588 and against aircraft of £91,177.

Sheerness.—The U.D.C. has agreed to the proposal of the Sheerness E.P. Co. to increase the charge for the supply of energy at the sewage works by 15 per cent.

Market Drayton.—The Salop C.C. has withdrawn its objections to the Electricity Co. erecting overhead lines, subject to the usual B. of T. regulations being complied with.

Masham.—The Council has intimated to the local company that no tender will be required for public lighting under present conditions.

Middlesbrough.—The Cleveland and Durham Power Co. has granted the T.C. further privileges respecting the maximum load taken, and the engineer reports that it is not now necessary to consider the question of bringing the battery up to date; he suggested that a gas engine plant be installed for emergency use, and this was agreed to. It was stated that the alterations would cost £1,000, and effect an annual saving of £500 or so, besides deferring for several years a further expenditure of some thousands. The engineer reported that, owing to the new arrangements, the services of a chief assistant would not now be required.

Monaghan.—**STREET LIGHTING.**—The Council has now given permission to a company to proceed with the erection of poles and wires for the introduction of public electric lighting.

Newport (Mon.).—**LOAN SANCTIONS.**—The L.G.B. has sanctioned the borrowing of £780 in respect of an electric sub-station at Mill Parade. The Board has also sanctioned the raising of £3,004 for mains and £500 for services, and has advised the Corporation that it has deducted £375 to be paid by the contractors in respect of the laying of cables from Pill sub-station. With regard to the proposed loan for the provision of power to the factory at Maesglas, the Board asks to be furnished with details showing how the revised estimate of £3,872 is made up.

Sheffield.—A recent issue of the *Sheffield Daily Telegraph* contained a reference to the phenomenal state of hustle which characterises the city electric supply department. It appears that the generating capacity of the department has been doubled since the war started, and is now being quadrupled. Our contemporary's pen-picture of the E.L. Committee running away from the "slow-going" Council, and of the efforts of chairman and manager to out-distance the Committee, depicts a refreshing atmosphere of alacrity not usually associated with municipal control in peace time. We understand that the Council will shortly be called on to sanction a further £137,000 expenditure on electricity extensions.

Stafford.—**PROPOSED LOAN.**—The T.C. has decided to apply to the L.G.B. for sanction to the borrowing of £12,000 for extensions to the electricity works.

Tasmania.—**HYDRO-ELECTRIC WORKS.**—Mr. Butters, the chief engineer, has submitted an estimate of £18,750 as the probable cost of completing the hydro-electric works. The total cost of the works, including the above amount, is placed at £338,998, exclusive of submerged land at the Great Lake, estimated eventually to extend over 5,000 acres and to cost £7,000 and of the cost of extension to North West Bay. Mr. Parry's estimate of the total cost of the first part of the scheme was £295,572, and the excess is attributed partly to payments in excess of preliminary valuation to the Complex Ore Co. and partly to generally increased cost of plant. It is announced that as soon as the annual consumption for domestic lighting in Hobart reaches a million units the price will be reduced to 4d. per unit.

Wadebridge.—**COTTAGE LIGHTING.**—The Electric Supply Co. has under consideration a scheme to supply electric light to the tenants of small cottages, at a weekly rate, which will compare favourably with the cost of oil or other means of lighting.

Walsall.—**MOTOR HIRE SCHEME.**—The electrical engineer has been authorised to negotiate a working arrangement with motor manufacturers, whereby they will supply motors on a three or five years' hire-purchase basis, through the sales department, without the department incurring any financial liability.

TRAMWAY and RAILWAY NOTES.

Argentina.—The first section of the Metropolitan electric railway, under construction at Buenos Ayres, was inaugurated on December 1st. The concession holder is the Anglo-Argentine Co. Three new tunnels will shortly be constructed to connect with the section inaugurated. The working day is 20 hours, and a three to five-minutes' service is given. On the opening day 100,000 passengers were carried.—*Industria e Invenções.*

Continental.—**DENMARK.**—At a recent meeting of the Danish Ingeniørforening, a discussion was initiated on the "Eventual introduction of electric driving on the boulevard tramways in Copenhagen and on the neighbouring tramway system."

SPAIN.—An application has been made by the Sociedad Minera y Metalúrgica de Panarroya for a concession to construct and work a narrow-gauge electric railway between Conquidor and Puertollano.

SWITZERLAND.—The General Management and the Standing Committee of the Swiss Federal Railways have just submitted a report to the Council of Administration in regard to the projected conversion of the Erstfeld-Bellinzona section of the St. Gotthard railway. It is first pointed out that the three-phase system would be unsuitable for the purpose in view, whilst the advocates of the direct-current method base their contentions on experience with lighter trains and pressures far below 3,000 volts. The single-phase system, which is already employed on the Lötschberg railway, can now be recommended for adoption without reserve. No other electric railway system exists which can be placed on an equality in regard to the varied nature of the service, the number of locomotives, length of the track, and extent of services rendered, with that of the New York, New Haven and Hartford Railway. At the same time this railway is the first which from the system used has proved itself to be extensible at will and capable of being accommodated to all kinds of services. In the case of the Lötschberg railway the interruptions in working were attributed chiefly to the difficult circumstances under which the electrical equipment had to be provided. The report also discusses the problem of uniformity in the form of current and periodicity, which it is sought to attain in the distribution of energy throughout Switzerland. The Amsteg and Riom power stations, which are proposed for the working of the Erstfeld-Bellinzona section, will be able to furnish energy not only for this section but also for the whole line from Lucerne to Chiasso, the conversion of which will not be long deferred.

Darlington.—The T.C. has agreed to certain increases of wages in the tramway department, which will entail extra expenditure amounting to £135 a year.

Dudley.—On Friday last, Timothy Parkes, the conductor concerned in the recent tramway accident, was charged with manslaughter at the Dudley Police Court, and committed to the next Worcestershire Assizes.

The inquest in connection with the second death resulting from the recent tramway accident, was resumed on Monday, the jury finding that Turner died as a result of the accidental overturning of the car, which was caused by the negligence of the conductor, Parkes; the jury added that they did not consider this culpable or criminal negligence and addressed certain recommendations to the tramway company.

Dundee.—Mr. Fisher, the tramway manager, has drawn attention to the necessity of renewing the overhead equipment in the centre of the city, which work will shortly be carried out by the electricity department.

Ecuador.—A decree has been published authorising the construction of a railway, with electric traction if convenient, between Quito and Esmeraldas. The line will pass, by preference, through the towns of Cayambe and Otavalo; the first section to be constructed will be from Quito to Ibarra. Should it be decided to employ electric traction, the erection of a power station would be undertaken at the same time.

Glasgow.—**WAR ECONOMY.**—Mr. Dalrymple has reported that there will be no expenditure on capital account this year, and that owing to depleted staffs ordinary expenditure will be reduced, but the saving will be counterbalanced by increased wages and war allowances. The T.C. has decided to purchase Thornliebank Gas Works, and ground is to be given up for road widening, the Tramways Committee contributing £500 towards the price.

Hindley.—The U.D.C. has approved a draft agreement with the Wigan Corporation for the lowering of the road under the bridge at Wigan Road, Hindley, to allow of the passage of double-deck tramcars, subject to the surveyor endeavouring to get the lowering tailed out to make the gradient not more than 1 in 80.

Jarrow.—The Town Improvement Committee has decided to communicate with the Tramway Co. regarding the condition of the tramway track.

Luton.—**TRAMWAY EXTENSION.**—The T.C. has been recommended to make application to the B. of T. for an order prolonging the period for the completion of the remainder of the tramway track for another two years from August 11th next.

LOAN SANCTIONS.—The L.G.B. has approved of the borrowing of sums amounting to £30,327 for electricity purposes, by the T.C.

North London Railway Electrification.—It is stated that the work of electrifying the North London Railway to Richmond will shortly be commenced, and that a much improved service will be the result.—*Pall Mall Gazette*

Southport.—It has been decided that horse haulage at the Corporation gas works shall be superseded by electric haulage in the near future; the rails already in use will be retained, and the Electricity Committee will supply the overhead equipment and the necessary vehicle.

West Lancashire.—The L. and Y. Railway Co. proposes to construct a light railway from the existing railway at High-ton round by Formby Point, rejoining the existing railway at Ainsdale, a distance of about six miles. The Light Railway Commissioners have been asked to issue an order authorising the work

Bootle.—February 23rd. Corporation. Stores, including lamps, meters, fuse boxes, &c. Electrical Engineer.

Dewsbury.—Electricity Department. Two second-hand 250 kw generators or panels, oil separator, piping, cables, &c. See "Official Notices" February 11th.

Dublin.—March 1st. Battery materials for carriage lighting, for the G.N. Railway Co. (Ireland). See "Official Notices" to-day.

Dundee.—February 28th. Corporation. Stores for the Tramways Committee. Mr. P. Fisher, General Manager.

France.—**PARIS.**—February 24th. The State Railway Service requires 3,500 copper rail bonds of 400 mm² section, and 9,900 of 200 mm² section. Bureaux du Service Electrique (3^e division), 72, Rue de Rome, Paris (8^e), Tuesdays and Fridays, 3 to 5 p.m.

Keighley.—30-H.P. electric motor installation for pump driving, for the Fleece Mills Co., Ltd. See "Official Notices" to-day.

London.—**BATTERSEA.**—February 21st. B.C. Stores for the Electricity Department. See "Official Notices" Feb. 4th.

New Zealand.—**DUNEDIN.**—May 17th. City Council. (1) Tramcar bodies; (2) electrical equipment. Plans, &c., from the Town Clerk, Dunedin.*

Plymouth.—March 2nd. Corporation. Converter with starter. See "Official Notices" to-day.

Pontypridd.—March 13th. U.D.C. Twelvemonths' supply of electrical stores for the Electric Light and Tramways Department. See "Official Notices" to-day.

Swansea.—March 6th. Education Committee. Electric lighting installation at Brynmill and Cwmbwria Council Schools. See "Official Notices" to-day.

West Ham.—March 22nd. B. of G. Three months' supply of electric fittings. Clerk, Union Road, Leytonstone.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Glasgow.—Tramways Committee.

Traction lamps—General Electric Co., Ltd., and Edison & Swan Co. Lighting conduit and fittings—Simplex Conduits, Ltd.

Messrs. W. Lucy & Co. asked the Electricity Committee for an increase of 10 per cent. on their contract prices for the supply of oil branch boxes, in consequence of the phenomenal rise in the price of pig-iron and foundry coke. The engineer reported that the other contractors for similar material had not applied for any increase, and the Sub-committee agreed to recommend that the increase be not granted.

Hampstead.—B.C. British Thomson-Houston Co., Ltd., for H.T. switchboard, £3,886.

London.—**ST. MARYLEBONE.** B.C.

British Westinghouse Co., Ltd.—Spare armature for rotary converter, at £1,018.
Ferranti, Ltd.—200 prepayment meters.

BERMONDSEY.—The Electricity Committee has given instructions for existing contractors to be asked to continue their contracts for supplies for a further 12 months on the same terms. The Committee has accepted a tender of the Glenboig Union Fireclay Co., Ltd., for 3,000 firebricks and one ton of fireclay in bags, for £28; and it proposes to renew for a further period of 10 years, upon the same terms, the agreement with the Tudor Accumulator Co. for the maintenance of the battery.

Newport (Mon.).—The contract for the supply of cables having expired, the electrical engineer proposes for the present to order supplies as required.

Park Prewett.—The tender of Messrs. Hill, Upton and Co. has been accepted by the Hants County Council, at £2,599, for telephones, fire-alarms, tall-tale clocks and bells, at the Park Prewett Asylum. This firm has the contract for installing the electrical plant.

Slough.—Messrs. Chamberlain & Hookham, Ltd., have received the contract for electricity meters for this year.

Sunderland.—Tender accepted by Electricity Committee:—Willans & Robinson, Ltd., blading for Willans turbine.

Walsall.—Electricity Committee. Accepted tender: Bell & Morcom, for a 3,750 kw. turbo-alternator (in place of one sold to the Government) for £13,227.

West Bromwich.—The tender of the New Conveyor Co. for extensions to the coal conveyor at the Council's electricity works has been accepted.

TELEGRAPH and TELEPHONE NOTES.

Air Raids.—In order to keep the lines free for official messages on the occurrence of air raids, the Postmaster-General has issued an appeal to the public to use the telephone as little as possible on such occasions, and on no account to call up the police or other public officials.

Australia.—It is hoped that the new telephone rates, which came into force on December 10th, will bring in an additional revenue of £180,000 a year. Increases in the postal and telegraphic rates will be made this year, in order to avoid a repetition of the deficit of over £600,000.

Canada.—On Monday last telephonic communication was effected between Montreal and Vancouver, a distance of 2,300 miles. Montreal was also connected with San Francisco.

CONTRACTS OPEN and CLOSED.

OPEN.

Aberdare.—March 8th. Electrical goods, for the Powell-Duffryn Steam Coal Co. Stores Manager, Aberaman offices. March 11th. U.D.C. Electrical stores for 12 months. See "Official Notices" to-day.

Australia.—**SYDNEY.** May 1st. Two 300-kw. turbo-alternators, condensers, switchboard, &c., for the pumping station at Ryle, for the Metropolitan Board of Water Supply and Sewerage at Sydney.*

May 3rd. N.S.W. Railways and Tramways Department. One 2,500-kw. turbo-alternator, for Zara Street, Newcastle, power house. Specifications (20s.) from the Engineer's office, 61, Hunter Street, Sydney.*

Birkenhead.—March 6th. Corporation. Cable and two rotary converters with switchgear. See "Official Notices" February 1st.

Bolton.—March 2nd. Electricity Committee. Stores, including some electrical items. See "Official Notices" Feb. 11th.

FORTHCOMING EVENTS.

Institution of Mechanical Engineers.—Friday, February 19th. At 6 p.m. At the Grand Central Hotel, Westminster, S.W. Annual General Meeting. Paper on "Chisels," by Mr. H. Fowler.

Greenock Electrical Society.—Friday, February 19th. At 7.45 p.m. At the Temperance Institute, 11, West Stewart Street. Paper on "Electro-Plating," by Mr. S. V. Thorp.

Royal Institution of Great Britain.—Friday, February 19th. At 5.30 p.m. At Albemarle Street, Piccadilly, W. Lecture on "Polarised Light and Its Applications to Engineering," by Prof. E. G. Coker.

Institution of Electrical Engineers Manchester Local Section.—Tuesday, February 22nd. At 8.30 p.m. At the Engineers' Club, 17, Albert Square. Paper on "Continuous-current Railway Motors," by Mr. E. V. Darnell.

(Birmingham Local Section).—Wednesday, February 23rd. At 7 p.m. At the University, Edmund Street. Kelvin Lecture on "Terrestrial Magnetism," by Dr. C. Chree, F.R.S.

Illuminating Engineering Society.—Tuesday, February 22nd. At 8 p.m. At the Royal Society of Arts, John Street, Adelphi. Discussion on "Some Future Possibilities in the Design of Instruments for Measuring Illumination."

Liverpool Engineering Society.—Wednesday, February 23rd. At the Royal Institution, Colquhoun Street. Paper on "Efficiency of Projectors and Reflectors," by Mr. H. T. Harrison.

Leeds Association of Engineers.—Thursday, February 24th. At 8 p.m. At 5, Park Lane. Paper on "Stamp Forgings," by Mr. B. Saunders.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, February 25th. At 7.30 p.m. At the Bilbce Hall, Newcastle-on-Tyne. General meeting.

Manchester Association of Engineers.—Saturday, February 26th. At the Grand Hotel, Argyll Street. Paper on "Cast Steel as a Material of Construction," by Mr. E. F. Lange.

Battersea Polytechnic, Battersea, S.W.—Saturday, February 26th. At 7 p.m. Annual conversation and inspection of students' work.

REVIEWS.

Electric Arc Phenomena. BY EWALD RASCH. Translated by K. TORNBURG. London: Constable & Co. Price 8s. 6d. net.

Before proceeding to deal with the electric arc, the author of this book devotes a dozen pages of introduction to calling attention to certain "facts, which, with exceptional force, should caution us to discreet tolerance and independence of thought on scientific subjects." The "facts" appear to be that, while as late as 1874, Kelvin, Tait, and Von Helmholtz thought to dispose of Newton-Weber's corpuscular theory of light by demanding to be shown a "light corpuscle," and made "unconditional, dogmatic surrender to Maxwell's theory of light," it was unanimously agreed at Salzburg, in 1909, by the highest authorities in theoretical physics (Einstein, Planck, Born-Minowski, A. Sommerfeld, and others) that Maxwell's theory of the universe and his ether hypothesis "must plainly be considered as obsolete." We agree with the author that scientific dogmatism is deserving of whole-hearted condemnation; we also agree that Maxwell's theory, while true for electromagnetic waves of great length, is inapplicable to the shorter waves which constitute the visible spectrum; and we fully appreciate the ingenious Planck-Einstein "Licht-quanten Hypothese" and Minkowski's time-coordinates. But there is surely a great gulf fixed between Newton's corpuscles and Einstein's light units; and there are surely some authorities in theoretical physics outside of Germany! It must be remembered that Sir J. J. Thomson, whose work on the electron in England ranks with that of any scientist, has alternatives even to Einstein's theory; and Dr. Wood of Baltimore, whose researches in physical optics give some weight to his opinion, remarks that "we may eventually be driven to a compromise between the old corpuscular theory and the wave theory." In fact, there is no unanimity among the world's scientists concerning the Planck-Einstein theory, and the consignment to oblivion of Maxwell's theory by the learned diet of Salzburg and the unanimity of their opinions does not convince us that Maxwell, Kelvin, Tait, and Von Helmholtz were the dogmatic blockheads that the author would lead us to suppose.

The author states that "the development of our mental pictures of a civilised world and of a physico-technical universe has been hindered, with more dire results, from the point of view of political economy, than were ever caused by the most bitter religious strife." The ideal of a physico-technical universe does not appear to us to be entirely desirable, but even supposing such a state has been postponed by this combat between rival theories, we decline to believe that men of the calibre of Kelvin and Tait have had any part or lot in the matter. The fact that even Goethe has devoted "several volumes of the sharpest kind of controversy against Newton, without making it clear to himself, or to us, what he is driving at," does not alter our opinion concerning the honesty of purpose of the great physicists of the nineteenth century.

The treatment of the electric arc is exceptionally complete—probably the most exhaustive monograph on the subject yet published.

The first chapter deals with the history of the electric arc, and rightly attributes the pioneer work to Davy. Some well-illustrated sections are devoted to the formation, starting, and

adjustments of arcs and the various types of arcs, D.C., A.C., and enclosed. In the third chapter electrode materials and their physical properties are described very fully. In this section the author points out the lack of experimental knowledge concerning emissive powers of substances at high temperatures, remarking that it is in this direction that the illuminating engineer will have to seek guidance for progress towards perfection of illuminants by the selection of efficient electrode materials.

There are short chapters on the theory of electrical discharges and spark discharges in which the excellent work of Steinmetz, Earhart, and Russell is briefly referred to; but the main portion of the book is devoted to the study of the voltage and current conditions, and the distribution of energy in the arc. In the former of these subjects the classical work of Mrs. Ayrton is made the basis of the treatment. Her study of the carbon arc is undoubtedly the most exhaustive yet made, and although the author modifies his equations to suit the results of the more recent experiments of Grau and Toepler, he relies on the Ayrton results and the Ayrton-Thompson equations for the greater portion of his treatment of the carbon arc. Perhaps the most important criticism that Rasch makes of Hertha Ayrton's experiments is in connection with her method of measuring the arc-length. Usually, like Hertha Ayrton, one denotes and measures the length of the arc as the axial distance between the edge of the anode crater and the point of the cathode. In reality, however, the true length of the arc, i.e., the length of the current-carrying gas column, is longer by the depth of the crater, a depth which is not entirely independent of the arc length and the current. The introduction of this true arc-length results in the correction and simplification of Ayrton's equation from

$$e = g + al + (\gamma + \delta l)j \quad (1)$$

$$e = m + l(a + \delta j) \quad (2)$$

where e , l , and j are volts, millimetres and amperes respectively and the constants are in (1) $g = 38.88$; $a = 2.074$; $\gamma = 11.66$ and $\delta = 10.54$; while in (2) $m = 36.59$; $a = 2.074$, and $= 10.54$.

Extending the theory to metallic electrodes, it is found that the value of δ is a linear function of the specific heat, and on page 97 a diagram is given indicating this relationship. Unfortunately, the linear law derived is quite wrong, and should read $\delta = 23 - 62c$ instead of $\delta = 23 \times 4 (1 - 2.7c)$.

Very little attention is given to mercury vapour lamps and hematite arcs, but the ordinary commercial types of arc are fully dealt with and valuable efficiency data are given.

On the whole, the German of Rasch is done into very fair English by the translator (Tornberg), but occasional obscurities and inaccuracies mar the translation. The German construction, in which the verb is eventually brought to heel near the end of the sentence, is occasionally met with, and the punctuation is erratic.

While the present work is a useful monograph on the subject, we do not think that it is by any means the last word on the electric arc, at any rate, so far as physicists and electrical engineers in this country are concerned.—P. H. S. K.

An Introduction to Applied Mechanics. By E. S. ANDREWS, B.Sc. Cambridge: University Press. Price 4s. 6d. net.

A preliminary survey of the pages of this book is sufficient to convince us that Mr. Andrews has had experience of the difficulties met with by students of mechanics, and that he is no novice in the art of text-book writing. A closer study deepens the conviction that the prefatory remarks are not the idle platitudes that we are accustomed to look for in prefaces, but are the sober truths concerning the present methods of teaching applied mechanics.

The author's experience leads him to the conclusion that the chief difficulties encountered by both teachers and students in applied mechanics are due to the treatment in the older form of text-book being too much that of applied mathematics—a kind of exercise ground for algebraic manipulation—and that in attempting to remedy this, the modern books have given too much engineering application of the principles of mechanics without sufficient explanation of those principles. Practical teachers of mechanics will recognise that Mr. Andrews has thus effectively summarised the defects that have rendered most class-books of mechanics useless for the instruction of engineering apprentices and the younger students in engineering colleges.

But the author has not only accurately diagnosed the weakness of the ordinary text-book; he has, in the 900 pages of this volume, prescribed a valuable remedy. He has avoided making his book into a course of mathematical gymnastics; at the same time, he has not gone to the other extreme and crowded out the adequate explanation of principles by practical examples and applications. The book before us is, in fact, a well-balanced treatise, in which a true view is kept of the relations between principle and practice, theory and experiment.

The order of treatment is somewhat unusual: Chapter I deals with Vectors, followed by Moments and Leverage, and Work, Power and Energy—subjects usually treated after the application of vectors to velocity, relative velocity and accelerations. Machines and Efficiency are dealt with in Chapter IV, and then the usual treatment of vectors is re-

sumed, followed by chapters on Energy, Momentum, and Newton's Laws. The book does not appear to suffer on account of this deviation from the usual order of treatment, and even the subject of Work, Power and Energy is successfully negotiated in spite of the postponement of the velocity and acceleration section. There are very obvious advantages in the introduction of moments and leverage and machines at an early stage, and, since the ideas of velocity and force are commonplace ideas which scarcely need definition, there appears to be no reason why the old order should not give place to the new.

There are excellent chapters on Stress and Strain, Riveted Joints, Frames, Beams, and Girders. Chapter XIII is a somewhat belated treatment of Centres of Gravity, a subject that might well have made an earlier appearance in the book; and another section that seems somewhat out of place is a chapter on curvilinear motion inserted between "Friction and Lubrication" and "Mechanisms and Gearing." All these subjects are, however, treated with remarkable clearness and practical insight.

The book is well illustrated; worked examples and descriptions of laboratory experiments are frequent, and every chapter is carefully summarised; and there are sets of well-chosen exercises following every one of the 17 chapters. An appendix includes trigonometrical tables, weights and measures, and some useful constants. The book is well bound and printed, and is in every way likely to fulfil the hope of its author "that it may be found of value as a class-book in the junior classes of engineering colleges and in public schools that have an engineering side."—P. H. S. K.

Continuous and Alternating-current Machinery Problems. By W. T. RYAN. London: Chapman & Hall, Ltd. Price 2s. 6d. net.

The average technical student is apt to find general principles and mathematical theory rather vague, and to enable him to get a genuine grasp of a subject—particularly a subject like electrical engineering—considerable practice with numerical examples is essential. This small volume, emanating from America, has been designed for administering a short elementary course of such examples.

On the whole, the problems are well chosen, and bear a resemblance to those with which an engineer meets in practical work. They cover a wide ground, and occasionally notes and hints for their solution are given. By people trained in this country, problems involving "circular miles per ampere" will probably be ignored.

The answers are not given—thus making the book of little use to a private student—and considering that the total number of pages is only 37, the price appears to be on the high side.—H. G. S.

NOTES.

Electrical Machinery for China Stopped.—With reference to the proceedings before the Prize Court in London, reported on page 748 of our issue of December 10th, we have received a communication which makes it necessary to state that the concern for which Mr. Dunlop asked for the release of certain electrical machinery was the Peking Electric Co. and not the Peking Chinese Electric Light and Power Co., Ltd. We have also received a copy of the *Peking Gazette*, in which a letter appears amplifying the explanation which we have just given. Mr. A. O. Buckingham, engineer-in-chief to the Peking Chinese Electric Light and Power Co., Ltd., there writes as follows:—

In case there should be any misconception as to which is the Peking Electric Co., and which is the Peking Chinese Electric Light and Power Co., Ltd., I would point out that the former has an order, which it enjoys in common with the Peking Chinese Electric Light and Power Co., Ltd., to supply in the Legation Quarters, and in no other part of Peking, whereas the Peking Chinese Electric Light and Power Co., Ltd., has power to supply over the whole of Peking including the Legation Quarters.

It will, therefore, be clear that the function of the Peking Electric Co. is more specific than general, and such terms as "Chinese Public Lighting Installation," and "Electric Light Co. of Peking," could only in their common acceptance be taken to refer to the Peking Chinese Electric Light and Power Co., Ltd.

The reason I am compelled to deal with this matter is, that my company's business is being seriously handicapped, owing to its being confused with the Peking Electric Co.

Mr. Buckingham's company has placed in England considerable orders for goods of which it is in great need. These goods are already very much overdue, and any doubt as to the identity of his company would cause the goods to be further delayed.

Fatality.—SHEFFIELD.—An inquest has just been held on a 16-year-old boy named C. H. Roper, who met his death from electric shock while having a bath. His brother John had fixed an electric lamp in the bathroom with flexible wire secured by tacks. Owing to the blind falling, John endeavoured to remove the lamp bulb (on account of the lighting regulations), but it was too hot to hold, and fell, with the wire attached, into the bath. The lad in the bath got so severe an electric shock that he died almost immediately. The pressure was 200 volts.

The Future of Electric Steel.—An article in the *Tennenger* states that the number of electric furnaces in the United States has increased during the past 12 months by 32 to a total of 73, and the American total now exceeds by 20 that of Germany, which had previously occupied the first place in this branch of industry. Of the German furnaces 16 are melting ferro-manganese, and, consequently, are not a factor in the steel trade. The American development of electric melting has been mainly in the production of cast castings of ordinary analysis, but more solid and free from blowholes than can be obtained by the basic Bessemer or the open-hearth process, and of alloy steels ranging from the high-priced "quality" steels used for aeroplane and automobile construction up to tool steel itself.

Even in Sheffield electric melting is making rapid headway; 15 furnaces were installed last year, of which eight are employed in melting high-speed steel. There is great scope for the electric furnace outside the manufacture of tool steel. New kinds of steel are in demand which can be successfully made only in that furnace, and the call of the aeroplane, automobile, and other progressive industries for steels of higher quality is compelling recourse to the same system. Statistics indicate that progress is chiefly with the arc type of furnace, which is making rapid strides everywhere. In the United States there are 68 against two of the induction type, and in other countries the number is 179 against only 35 induction furnaces.

According to the *Iron Age*, the total number of furnaces in operation for electric melting of steel has increased from 213 to 303. Germany now takes second place with 53, an increase of only six. Progress was greater in England than in any other European country, our number of furnaces having gone up from 16 to 46, and there is every probability of the same rate of increase being maintained in the near future. A considerable number of contracts for new installations have been placed or are under consideration, and many more will be needed if steelmakers in the country lay themselves out (as is highly probable) to capture a share of the huge trade in small steel castings which in the past has been left largely in the hands of Continental firms. There is a decided opening for a small electric furnace of moderate first cost and simple design, both for the production of small castings and special steels for various purposes.

During the year Sheffield has installed or contracted for electric furnaces as follows:—Hedfields, Ltd., 5; Vickers, Ltd., Thos. Firth and Sons, Ltd., John Brown & Co., Ltd., and Brown, Bayley's Steelworks, Ltd., two each; Arthur Balfour & Co., Ltd., S. Osborn and Co., Ltd., and the University of Sheffield, one each. The whole of these furnaces are of the Héroult type, and range in capacity from 3 to 10 tons. Eight of them are producing tool steel and the remainder castings and war material. The following British firms have also installed or are installing electric furnaces: London Foundry Co., Ltd., Brimsdown; Daimler Motor Co., Ltd., Coventry; Twitales Bros., Ltd., Bradford; and T. Summerson and Sons, Ltd., Darlington.

As regards types, the Héroult furnace stands first with a world total of 115 out of 303, induction furnaces ranking second with 38, the Rönnefeldt third with 35, and the G. Sawall next with 15. The number of Héroult furnaces in the United States has increased from 19 to 43. Other figures for the same country are Snyder 14, Wile 7, and Rönnefeldt 2. There are also 4 Rönnefeldt installations in England at the following works:—Elgar Allen & Co., Ltd., Sheffield; A. Kenrick & Sons, Ltd., Birmingham; Steel Castings, Ltd., Birmingham; and Electro Flex Steel Co., Ltd., Dunston. There are 11 electric furnaces in Russia, 23 in Sweden, and 6 in Norway. In Canada the manufacture of steel by electric melting is carried on by Electric Steel and Metals, Ltd., Ontario; Armstrong, Whitworth, of Canada, Quebec; Thomas Davidson Manufacturing Co., Montreal; and the Canadian Brake and Shoe Co., Quebec, these firms having 8 furnaces among them.

In the foregoing extracts it is not made clear whether the considerable number of electric steel furnaces installed by Messrs. Electrometals, Ltd., in Sheffield and other English towns are included. These furnaces were described in our issue of October 8th, 1915.

Institution and Lecture Notes.—Insurance Institute of London.—On Monday afternoon last Mr. Alfred Hands, delivered the first of two lectures on "Storms, Lightning, and Lightning Conductors," at Gresham College, E.C. The second lecture will be given on Monday, February 28th, in the Hall of the Insurance Institute at 11 Queen Street, E.C.

Institution of Electrical Engineers.—A special general meeting of the corporate members of the Institution will be held on Wednesday, March 1st, at 5 p.m., for the purpose of considering and, if thought fit, of passing the following resolution as an extraordinary resolution with the view to its subsequent confirmation as a special resolution:—

"That the following words be added to Article 41 of the Articles of Association, namely:—(a) In the event of a state of war arising between the United Kingdom of Great Britain and Ireland and any other country or State, any member of any class who at any time during such war shall be a subject of such enemy country or State shall forthwith cease to be a member of the Institution, and in the case of the European War of 1914 all such members shall cease to be members of the Institution on and after the 16th day March, 1916."

Should the above resolution be passed by the requisite majority, a further special general meeting will be held on March 16th, when the said resolution will be submitted for confirmation as a special resolution.

The Committee of the Privy Council for Scientific and Industrial Research has made the following grants to the Institution for one year's research work:—H. Sating of buried cables, £810; properties of insulating oils, £250.

The provisional programme of the BIRMINGHAM LOCAL SECTION for the second half of this Session includes the following:—

February 23rd.—Dr. C. Chree—Kelvin Lecture on "Terrestrial Magnetism."

March 15th.—Mr. N. W. Storor—"The Possibilities in the Design of Continuous-Current Traction Motors."

April 14th.—To be arranged.

MR. C. P. SPARKS, president, accompanied by MR. P. F. ROWELL, secretary, was present at a meeting of the NEWCASTLE LOCAL SECTION on the 15th inst. Mr. P. V. Hunter presided, and there was a very good attendance, including many of the principal electrical engineers in the district, who offered the visitors a hearty welcome. The President addressed the meeting on the work of the Institution, and afterwards a paper, with lantern illustrations, was given by MR. R. W. GREGORY, dealing with the Roman Wall. The arrangements were admirably carried out by Mr. J. R. Andrews, the local secretary.

Birmingham Electric Club.—On Saturday last a paper was read by Mr. H. W. Wolton on "Electric Welding."

Electrolytic Copper in Germany.—According to *Industria e Invenienze*, a new factory is to be started in Germany for the refining of copper by electrolysis, at Bitterfeld, the owners being the Hüttenwerke, of Niederschöneweide. The energy required will be 2,000,000 kw.-hours yearly, which will be supplied by the power station at Glöps Jensenitz. This will make the third electrolytic copper works in the German Empire.

Electricity at Dublin Quays.—In the High Court, Dublin, Mr. Justice Pim made a consent rule of Court in a case by the Corporation against the Port and Docks Board and the Steam Packet Co., in regard to the opening-up of the quays for the laying of electric wires from the pathway. The settlement provides for notice of intention to open, the city engineer to require defendants to guard against the interruption of the city electricity supply and other utilities.

Volunteer Notes.—ENGINEERING INSTITUTIONS' VOLUNTEER ENGINEER CORPS.—Orders for week commencing February 21st, 1916.—By Lieut.-Col. C. B. Clay, V.D., Commandant.

Drills, 6.25 to 7.25; 7.25 to 8.25 p.m.

Monday, February 21st.—Sections 1 and 2, Technical; Sections 3 and 4, Lashings and Trestle Bridging, Signalling Class and Recruits.

Tuesday, February 22nd.—School of Arms, 6 to 7 p.m.

Thursday, February 24th.—Shooting for Sections 1 and 2, and Signalling Class.

Friday, February 25th.—Sections 3 and 4, Technical; Sections 1 and 2, Lashings and Trestle Bridging; Signalling Class and Recruits.

Saturday, February 26th.—Uniform Parade, 2.45 p.m.

E. G. FLEMING,

Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Colonel S. G. Grant (Officer Commanding), Thursday, February 17th, 1916:—

Week-end Parades.—**Saturday.**—The Battalion will parade at Wembley Park at 3.15 p.m. for drill under Company Officers. "Derby" recruits are invited to attend.

Sunday.—The Battalion will parade at Liverpool Street Station (low-level entrance, G.E.R.) at 9.30 a.m., and proceed by train for Eatreaching duties. Members will carry their own lunch. The Battalion will return to town about 6 p.m.

Winter Quarters.—The Fatigue Party, under Corporal Manning will parade, as usual, at Wembley Park, on Saturday and Sunday next.

Musketry.—There will be a Shooting Match at Bisleigh on Saturday next, the 19th inst. Parade in uniform at Waterloo Station, No. 9 Platform, at 12.45 p.m.

A. G. JOINER, Major and Adjutant, O.B.C.

For Sale.—The Stoke-on-Trent Electric Supply Committee has for disposal two Belliss and four Roworth engines, D.C. and A.C. generators. See our advertisement page to-day.

Rock Drills.—Replying to the discussion on a paper on "Compressed Air for Coal Cutters," which he read at a meeting of the Mining Institute of Scotland, in Edinburgh, on Saturday, Mr. Sam Mavor said the complaint that a satisfactory electric rock drill had not been produced was a valid one, but he now believed that the days of the compressed-air rock drill were numbered. He had recently seen in operation a rock drill constructed in accordance with a novel system of power transmission, which absorbed only one-fifth of the power required by a compressed-air drill, and could be used in association with any electrical plant. The system had features which differentiated it from any other attempts to compete with the compressed-air drill, and he believed it was destined to revolutionise all branches of civil engineering and mining which were based upon rock drilling.

Flood-lighting—a Contrast.—We reproduce herewith from the *Electrical World* a view of the "matchless Tower of Jewels" at the San Francisco Exposition, as it appeared at night. This will interest readers in this country, especially residents in

the city of —, and will assist their imaginations to conjure up some idea of what might be there were it not otherwise ordained. After the war, perhaps—

Farm Supply in Eastern Pennsylvania.—A recent issue of the *General Electric Review* contains an article by Mr. J. W. Price on the subject of rural development of transmission lines which details more particularly the experience of two companies in the supply of electricity to farms. The first company has acquired its rural consumers incidentally, but having been led to investigate matters is establishing a definite policy for acquiring farm consumers. It has at present 125 such consumers, and has put up 12 miles of special lines in quarter to half mile lengths, the majority of the farms being connected to lines put up for other purposes.

Of the 125 farmers mentioned, 30 are power consumers, and all are users of light. The 95 consumers using only light give an average revenue of £3 15s. a year: the average revenue per farm power consumer (including lighting) is £16 18s. a year. The supply is charged at 6½d. per unit for lighting, less 20 per cent. discount, and 2½d. per unit for power, less 10 per cent. discount, with a monthly minimum bill of 4s.

The total farm power load is 412 H.P., or 307·35 kW., and the total farm load (including lighting) 432·35 kW., representing 3·46 kW. per consumer, and a demand of 55,000 units, rather more than half being lighting units.

The second company adjoins the one just referred to, and has 32 miles of lines, much of which, however, is used jointly for telephone and power wires. Current is being supplied for street lighting, but the principal load consists of farms, to whom a special tariff is offered, one of the conditions of contract being that where the prospective load is not such as to warrant an extension at the company's expense, the extension will be installed if the consumer agrees to guarantee revenue within two years to cover the cost of the extension. The customer pays for and maintains his transformer and main switch, with the idea that he will switch off his transformer when not in use, and save core loss.

The lighting rate is 6½d. per unit, less 10 per cent., with minimum charges; cooking, heating, battery charging and motor service above 1 H.P. are classed as power, and supplied on a sliding scale varying from 4d. to 2½d. per unit, with 10 per cent. discount and minimum charges.

There are 40 farm customers, and 30 use both light and power, the total motor load being 325 H.P., of which 228 H.P. is distributed amongst the 30 consumers referred to, giving an average of 7½ H.P. each. The company has now adopted a standard 10-H.P. motor for its consumers.

Six consumers, representative of the whole, show an average yearly revenue for power and lighting of £15; for 40 farms the total is taken at £578. Three of the farms have their motors mounted on trucks, and it may be noted that vacuum cleaners, washing machines, sewing machines, irons, &c., have been adopted in considerable numbers.

It is mentioned that the tendency is to keep the H.P. rating down with a view to distributing the load throughout the day; also that experience shows that it is only a short time before the lighting consumer adopts electric power appliances.

None of the consumers above mentioned employ irrigation pumping.

Italian Progress in Electrochemistry.—The prizes awarded yearly by the Brambilla Foundation for inventions or processes calculated to be of advantage to the population of Lombardy, have, for 1915, been awarded, as regards the first prize, to the Società Anonima Ferriere di Voltri, of Voltri and Darfo, for alloys of iron produced in the electric furnace, &c., and for the impulse it has given to electrometallurgical production in Italy. The second prize is awarded to the Società Elettrica Electrochimica del Caffaro, of Milan and Brescia, for an electrolytic substance styled "Pasta Caffaro," for the prevention and combat of the vine disease termed peronospora.

Electricity Works as "Controlled Establishments."

—The Glasgow Electricity Committee has appointed a Special Sub-Committee to confer with representatives of the Gas Committee as to the question of making application to have the electricity department declared a "controlled establishment."

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—At the Electricity Works, Stamford, Mr. F. H. BRANDRETH, the resident engineer (Lieutenant, 67th Provisional Territorial Force), was presented by the staff with a pair of silver candlesticks on the occasion of his marriage. Mr. J. E. Edmundson made the presentation.

Mr. T. K. RICHARDSON, station superintendent at the Marylebone B.C. electricity works, who was granted three months' leave of absence on November 4th, owing to illness, has been granted a further three months' leave.

Mr. R. PARKER has retired from the position of foreman at the Bristol T.C. electricity works after 22 years' service, and Mr. J. STAPLETON has been appointed his successor at a salary of £169 per annum. Mr. Parker's health has broken down, and at the Council meeting the question of a pension was raised. Alderman Pearson replied that there was no scheme in existence under which Corporation workmen could receive a pension, the Council having refused to listen to his own proposals on the matter. Mr. Parker was entitled to every consideration. The Committee is to report upon his case. One member proposed that he be granted a year's salary.

The St. Marylebone B.C. has increased the salaries of the following members of the electricity supply staff:—Mr. W. HARPER, assistant accountant; Mr. W. H. SHORTER, chief assistant, sales department; and Mr. C. H. CAPE, shift engineer.

Mr. E. J. WALSH, chief assistant engineer to Kilmarnock Corporation, where he has been for the past four years, has been appointed resident engineer by the Musselburgh and District Electric Light & Traction Co., Ltd.

Petty Officer S. HANN, attached to the *Hawke* Battalion, R.N. Division (borough electrical engineer, Stoke Newington), received special mention in a dispatch by General Sir Ian Hamilton on September 22nd, 1915.

Mr. J. LEWIS, assistant engineer at the Sleaford Urban Council electricity works, has resigned.

General.—At a complimentary dinner, given on Saturday, 5th inst., at the Princess Restaurant, Newcastle-on-Tyne, Mr. J. SPENCE was presented, on the anniversary of his 21 years as district manager of the General Electric Co., Ltd., with a silver rose bowl by the staff.

The Committee of the Privy Council for Scientific and Industrial Research has appointed the Hon. Sir C. A. PARSONS, F.R.S., to be a member of the Advisory Council, in place of Prof. Bertram Hopkinson, F.R.S., who has been forced to resign by the pressure of duties connected with the war; and Prof. J. F. THORPE, F.R.S., to fill the vacancy caused by the death of Prof. R. Meldola, F.R.S.

Mr. T. G. TRAVIS has resigned his position as general sales manager with the Electrical Apparatus Co., Ltd., in order to join the sales organisation of the British Westinghouse Co., Ltd., at Trafford Park, and will commence his new duties on the 17th inst. Mr. Travis was previously with the British Westinghouse Co. for some years, subsequently joining the Electrical Apparatus Co. as Manchester representative.

The Illuminating Engineering Society (U.S.A.), on February 10th, gave a banquet in New York in honour of Mr. T. A. EDISON, who was made an honorary member.

Private M. F. BELLIVEAU, electrical engineer, of the 55th Canadian Infantry, was married last week at the Catholic Church of St. Lawrence, Petersfield, to Miss Ruth Maude Gibbins.

Roll of Honour.—Trooper JOSEPH WM. ODELL, of the Berkshire Yeomanry, who was on the staff of the Pulometer Engineering Co., Ltd., of Reading, and had served with the regiment in Egypt, has died from consumption.

The D.C.M. has been awarded to Sergeant COLIN MORRELL, of the 21st West Riding (Sheffield) Royal Engineers, who was, before enlistment, underground electrician at the Hickenham Main Gallery.

Private DAVID QUINN, of the 7th Battalion Lancashire Fusiliers, formerly employed by Messrs. W. T. Glover & Co., Ltd., at Trafford Park, has been wounded, and is in hospital at Cairo.

The D.C.M. has been awarded to Private F. MOTTERSHED, of the 7th Battalion Lancashire Fusiliers, formerly employed by the British Westinghouse Works, Trafford Park.

We are sure that our readers will join with us in congratulations to the President of the Institution of Electrical Engineers, Mr. C. P. STARKS, upon the honours gained by two of his sons who are with the Forces. Reference was made to the matter at last week's meeting of the Institution. The facts are these:—Lieutenant A. C. STARKS, R.E., received the ribbon of the Military Cross from his Corps Commander in France on February 5th. This was awarded him following the night attack on January 11th-12th, 1916. Captain HARRY STARKS, Suffolk Regiment, was decorated by the King at the Investiture on January 15th, 1916, with the Military Cross, awarded February, 1915.

Obituary.—SIR C. RIVERS WILSON.—We regret to record the death, which occurred on February 9th in London, at the age of 85 years, of Sir Chas. Rivers Wilson. The deceased gentleman was for some years chairman of the British Electric Traction Co., Ltd., also of the Rand Central Electric Works, Ltd., which was taken over by the Victoria Falls Power Co.

MR. HERBERT KINGSFORD.—Mr. Herbert Kingsford, whose death was announced here last week, was chief of the staff of the Central and South American and Mexican Telegraph Companies. Mr. Kingsford began his career with the Telegraph Construction & Maintenance Co., and took part in some of the Atlantic cable-laying expeditions of the *Great Eastern*. He afterwards joined the Commercial Cable Co., and sailed in the ill-fated *Minia*, but later was for many years in Peru with the companies first named. He was patentee of a bell-ringing grapple used by cable-laying concerns.

MR. BELVEDERE BROOKS.—The *Daily News* reports the death of Mr. Belvedere Brooks, of the Western Union Telegraph Co., who began as a messenger boy in 1870 and worked his way up to the top.

MR. JOHN WOOD.—We regret to record the death, in his 65th year, of Mr. John Wood, which occurred on 14th inst. at his residence at Forest Hill. The deceased gentleman was senior partner in the firm of Mosses & Mitchell, of Chiswell Works, Golden Lane, E.C., and a director of several London firms.

NEW COMPANIES REGISTERED.

Scott Electrical Co., Ltd. (142,870).—Registered February 9th, by Pepper, Tongue & Winterton, 34, Waterloo Street, Birmingham. Capital, £100,000 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in lighting sets and starting apparatus, lamps, dynamos, magnets, and electrical and other apparatus, and accessories of all kinds, and parts thereof, for use in connection with motor vehicles, airships, aeroplanes, seaplanes, boats, and ships, manufacturers of and dealers in such vehicles, and cycles, carriages and other conveyances for use on the road, in the air, or on the sea, electrical, mechanical, hydraulic, automobile and general engineers, etc., and to adopt agreements with the Elandom Co., Ltd., and Jesse Vardon, Ltd. The subscribers (with one share each) are: J. Varley, Elmside, Wightwick, Wolverhampton, accountant; R. H. Johnston, 49, Queen Street, Wolverhampton, chartered accountant; P. Smith, Ravensholt, Sunnelfield, Wolverhampton, secretary; F. H. Pepper, 34, Waterloo Street, Birmingham, solicitor; H. Walker, 117, Poplar Avenue, Edgbaston, Birmingham, managing clerk; J. E. Smith, 78, Springfield Road, King's Heath, Birmingham, hatter; J. W. Harvey, 38, Algenon Road, Birmingham, accountant. Minimum cash subscription, 25,000 shares. The first directors (to number not less than three or more than ten) are: J. Varley, E. J. Hardy, Alverstone, Park Road, Coventry, and G. R. Cornwallis, Roseland, Albemarle Road, Norwich. Until otherwise determined the said directors shall form a committee of management of the board of directors. The Elandom Co., Ltd., shall, for a period of ten years have the right to nominate a director, so long as they hold 500 shares. Qualification (except such nominal), £500. Remuneration (except managing director), £50 each per annum (chairman £100). Each member of the management committee of the board shall receive a further £200 per annum as remuneration. Registered office: National Provincial Bank Chambers, Queen's Square, Wolverhampton.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Bullers, Ltd. (62,020).—Capital, £400,000 in £10 shares (20,000 paid). Return dated December 21st, 1915: 15,000 ord. and 15,000 pref. shares taken up; 15,000 pref. shares called up on 7 ord. and 15,000 pref.; £21,070 paid; £11,750 received as paid on 14,993 ord. shares. Mortgages and charges: Nil.

Gambrell Bros., Ltd.—Land Registry Charge on the company's "Electrical Laboratories" in Meeson Road, Southfields, dated January 12th, 1916, to secure all moneys due or to become due from company to National Provincial Bank of England, Ltd., 150, High Street, Putney, S.W.

Osram-Robertson Lamp Works, Ltd. (formerly Osram Lamp Works, Ltd.) (35,312).—Capital, £250,000 in 7,500 "A" and 2,500 "B" shares of £10 each and 150,000 pref. shares of £1 each. Return dated December 9th, 1915 (filed January 7th, 1916): 7,500 "A," 2,500 "B," and 125,250 pref. shares taken up; £10 per share called up on 5,000 "A," £50,000 paid; £178,250 considered as paid on 2,500 "A," 2,500 "B," and 128,250 pref. shares. Mortgages and charges: £24,000.

Kingolite Co., Ltd.—A memorandum of satisfaction to the extent of £50 on January 6th, 1916, of debenture dated July 9th, 1914, securing £400, has been filed.

John Spencer, Ltd. (56,764).—Capital, £75,000 in £5 shares (10,000 paid). Return dated December 21st, 1915 (filed January 5th, 1916): 10,000 ord. and 1,027 ord. shares taken up; £55,135 considered as paid on 11,027 shares. Mortgages and charges: £25,000.

Robert W. Blackwell and Co., Ltd.—Capital, £250,000 in £1 shares. Return dated January 14th, 1916 (filed January 27th): All shares taken up; £1 per share called up on 100,000, £100,000 paid; £149,993 considered as paid on 149,993 shares. Mortgages and charges: Nil.

Aluminium Foil Co., Ltd.—Mortgage dated December 8th, 1914, to secure £15,000, charged on the Bridge Road Engineering Works, Harlesden, Holders: International Foil Co., Ltd., 135, Strand, W.C. (Registered February 2nd, 1916, pursuant to Order of Court).

Pernambuco Tramways and Power Co., Ltd.—Issue on January 11th, 1916, of £100,000 debentures, part of a series of which particulars have already been filed.

Enfield Electric Cable Manufacturing Co., Ltd.—Deed of further charge on certain hereditaments and premises dated January 27th, 1916 (supplemental to mortgage dated November 5th, 1914), to secure £2,750. Holders: Viscount Grimston, The Camp, St. Albans, Co. J. Andrews, 140, West Campbell Street, Glasgow; and F. Platts, Fountainbleau, Dares Road, Forest Hill, S.E.

Bourne End Electric Installation Co., Ltd. (98,428).—Capital, £5,000 in £1 shares. Return dated December 30th, 1915: 1,000 shares taken up; £7 paid; £993 considered as paid. Mortgages and charges: £200.

Westinghouse Cooper Hewitt Co., Ltd. (89,947).—Capital, £300,000 in £1 shares. Return dated December 17th, 1915: All shares taken up; 9s. 6d. per share called up; £14,250 paid. Mortgages and charges: Nil.

CITY NOTES.

St. James' and Pall Mall Electric Light Co., Ltd.

MR. WALTER LEAF, presiding at the annual meeting on Tuesday, said that they had to recognise that their industry had yet to suffer for an indefinite time under conditions which were wholly adverse and brought no war profits. Last year they set aside £4,500 to be used this year for the equalisation of dividends, hoping to maintain the rate at 10 per cent., but conditions had been worse than they anticipated. Their estimate of reduced revenue was correct, but expenses had exceeded the estimate by £3,000. The loss of profit due to the war was, therefore, about £12,000 additional, and they were only able to pay 8 per cent. The increased expenditure showed itself chiefly in the accounts of the Central Co., on which they relied more and more for their supply. The cost of the unit for electricity purchased had risen materially, and it had been thought desirable by the two companies concerned that, in order to keep down the cost, the Central Co. should not declare a dividend for 1915; they would thus be that amount short in next year's revenue. They had had to renovate the plant at Grove Road Works, and had added a large new turbo-generator and boiler plant. A large reserve of coal had had to be held. These two causes involved considerable capital expenditure, which must be provided by the companies until it could be made up out of the large provision for depreciation. For this reason they were proposing to extend the borrowing powers. They had entered into an arrangement with their neighbours, the Marylebone Borough, for mutual support in the event of certain emergencies. 61 of their men had joined the Colours, and six had been killed. Theirs was accepted as a public utility undertaking, and a number of their skilled staff were to receive war service badges. Their investments, which cost just over £55,000, stood at £15,716 at December last. They were not ear-marked for any special purpose, and, unless some unforeseen necessity arose they intended to hold them until the liquidation of the business. If at that time there was depreciation, it would be a capital depreciation, and would have to be met out of the capital reserve fund. It was not a depreciation that must be made good out of revenue. In regard to the future, if the war stopped tomorrow they would at once step back into their previous prosperity, but while the war continued profits could not improve. The revenue showed unexpected elasticity in the second half of 1915, and there was a real growth due to extended electrical power and heating business, and to somewhat increased charges to consumers. That increase had been well received, and they would profit more by it in 1916 than in 1915, but it was not a resource upon which they could largely depend. There came a point at which any increase of charge simply meant that the demand was cut down. They looked to increased heating and power demand to make up for the shop lighting loss. The report was adopted, and a resolution increasing the borrowing powers to the extent of £50,000 was also carried.

Westminster Electric Supply Corporation, Ltd.

Lamps, motors, &c., connected increased during 1915 from 41,201 kw. to 42,355 kw. Out of profits £2,000 has been set aside, together with £500 received for founders' shares cancelled in 1897, to the reserve fund; these sums more than cover the loss on investments realised during 1915. After allowing for depreciation, sinking fund and other charges, and paying 8 per cent. final on the ordinary shares, making 7 per cent. for the year, £1,518 is carried forward. Units sold 22,435,878 (including a.c. supply of 1,267,258); used on works 325,690. Annual meeting: February 23rd.

Mr. JOHN BOOTH, at the annual meeting on February 9th, said that the company had had to face the loss of many reliable men, increasing expenses for fuel, rates and taxes, and for the greater part of the year a falling revenue; but new consumers had enabled them to end the year with a record output for December. They had had to pay more for loans, and had now raised the rate of interest to 4½ per cent. and 5 per cent. Older machinery had been taken out, allowing for the installation of one of the latest and most efficient turbine sets, by which substantial saving would be effected in the fuel account. The balance on the net revenue was £13,353, against £15,240 a year ago. With an increased output and new machinery, the company was in an excellent position.

The net profit for 1915, including £15,334 brought forward, after allowing for depreciation and manager's commission, was £61,555. After putting £5,000 to general reserve, to income-tax account £2,600, to depreciation on investments £152, paying 6 per cent. on the preference shares, and 8 per cent. on the ordinary, plus a bonus of 15 per cent. free of tax, £39,092 is carried forward subject to the special taxation of the year, the amount of which is at present unascertained. For 1914 the dividend was 8 per cent. and the bonus 15 per cent. Annual meeting: February 24th.

The net profit for 1915 was £3,634 (1914, £2,964; 1913, £2,569). Steady progress is again reported, and in view of the increased expenditure, the lighting restrictions, and other difficulties occasioned by the war, the results are very satisfactory. After including £602 brought forward, £1,000 is put to reserve, 6 per cent. is paid on the ordinary shares, and £1,031 is carried forward subject to directors' remuneration. The company's strong position is largely due to its close association with the Yorkshire Electric Power Co., and to the benefits of agreements with that company for bulk supply and management. These have enabled the year's difficulties to be met in a manner and at a cost which would not have been possible with separate generating stations and a separate organisation. The Selby and Stanley Provisional Orders have been granted, but they will not come into force until after the war, nor will further applications be considered by the Board of Trade during the war, save under exceptional circumstances. Annual meeting: February 29th.

Smithfield Markets Electric Supply Co., Ltd.—The gross profit for 1915 was £4,250 (£4,576 for 1914), and the net profit £2,816 (£3,139 for 1914). £400 has been put to debenture stock redemption, and £1,250 to depreciation. After paying the dividend of 2 per cent., £1,296 is carried forward. The output was maintained, but costs increased. Matters in dispute re existing oil plant have been settled on favourable terms and the cost charged to capital. An improved design oil generating set, to replace the last remaining steam set, will be ready for working in the early spring.

Cambridge Electric Supply Co., Ltd.—During 1915, 99 additional consumers were connected and 1,067,081 units were supplied, an increase of 55,246. The profit was £9,359, plus £2,647 brought forward. Debenture and other interest absorbed £1,793, £3,000 is put to depreciation fund, and, after paying 5 per cent. for the year on the ordinary shares, £2,753 is to be carried forward. The 1914 dividend was 6 per cent. Annual meeting: February 23rd.

Crossley Bros., Ltd.—Final dividend 3 per cent., making 5 per cent. for the year. The amount to credit of revenue account for 1915 was £99,015. £20,000 has been placed to reserve and £30,330 is being carried forward. Capt. Eric Crossley has been elected to the board in place of the late Mr. Brian Crossley (killed in action).

Central London Railway Co.—A dividend of 1½ per cent. is declared on the undivided stock for the past half-year, making 3 per cent. for the year; one of 2 per cent. on the preferred ordinary, making 4 per cent. for the year; and one of 2 per cent. for the year on the deferred ordinary, carrying forward £16,685.

Metropolitan District Railway Co.—After paying the dividend on the 4 per cent. guaranteed stock, and 4½ per cent. on the 4½ pref. stock, a dividend of 1½ per cent. is paid for the last half-year on the 5 per cent. second pref. stock, making 3 per cent. for the year, carrying forward £13,952.

Chelsea Electricity Supply Co., Ltd.—For the last half of 1915 the ordinary dividend is to be at the rate of 4 per cent. per annum, making 4 per cent. for the year, carrying forward about £3,260. The dividend for 1914 was 5 per cent.

London Electric Railway Co.—After paying the full dividend on the 5 per cent. pref. stock, a final dividend of ¾ per cent. is to be paid on the ordinary shares, making 1¼ per cent. for the year, carrying forward £12,303.

Telegraph Construction and Maintenance Co., Ltd.—In addition to the interim dividend of 5 per cent. a further dividend of 10 per cent., together with a bonus of 12s. per share, are now announced. The 1914 distribution was at the same rate.

National Boiler and General Insurance Co., Ltd.—Total dividend for 1915, 30 per cent., less tax.

Underground Electric Railways Co. of London, Ltd.—After paying the full interest on the 6th per cent. first cumulative income debenture stock, and on the 6 per cent. income bonds, £38,500 is to be carried forward.

Liverpool Overhead Railway Co.—For 1915 the gross receipts were £95,232, and the working expenses, including appropriation to reserve funds, were £64,435. Passengers carried 15,082,502, as against 13,361,944 in 1914. After paying 5 per cent. on both classes of preference, and 3½ per cent. on the ordinary shares for the year, £6,373 is carried forward. Annual meeting: February 22nd.

London Electric Wire Co. and Smiths, Ltd.—Distribution on the ordinary shares for 1915: 12½ per cent. (7½ per cent. dividend and 2s. 6d. bonus). £50,000 is put to reserve and £28,559 is carried forward. For 1914 the dividend was 10 per cent.

Mather and Platt, Ltd.—Ordinary share dividend for 1915, 12½ per cent., less tax.

Fredk. Braby and Co., Ltd.—Interim dividend on the ordinary shares: 5s. per share, free of tax.

STOCKS AND SHARES.

TUESDAY EVENING.

Alteration in the form of this Stock and Shares article and price lists is rendered necessary, of course, by the Government's action with regard to the supply of paper. Journals have to make the best of it they can, without raising unnecessary fuss; and so, far as this particular section of the ELECTRICAL REVIEW is concerned, we say no more than to hope that the excision of various quotations from our lists of securities will not be a matter of noticeable inconvenience to any of our readers. From time to time, it is proposed to add to the accompanying tables others of securities such as those which we are taking out this week; and, as it has been said on former occasions, if there are prices which friends of ours find it difficult to obtain, we shall be always very pleased to do our best to get them.

Round the Stock Exchange markets are generally hard. There is a slight yielding in the prices of Consols and some of the other gilt-edged stocks, thanks to the permission just given by the Treasury to the French holder of British stocks and shares that he may sell in London markets, under stated restrictions. This has dislodged a certain amount of stock which was held on French account, seeking opportunity for some time past to be allowed to sell. Moreover, the shadow of the next War Loan once more drags across the investment markets. It was driven away in the early winter by the issue of Exchequer Bonds; but its advent cannot be delayed much longer, and the probable date assigned to it at present is somewhere in April.

The electric lighting markets are somewhat inclined to heaviness. Chelseas eased off to 3½ on the reduction in the dividend from 5 per cent. to 4 per cent., but otherwise the list of West End shares is unchanged. South Londons maintain their rise of 3½, thanks to the repetition of the 5 per cent. dividend. There is a little doing in Westminsters, the price keeping hard at £6; while in the preference also there is an occasional bargain marked in the neighbourhood of £4.

City of London ordinary slipped back to 12, and the preference to 10½, showing falls of 5s. in each case. The declines were associated with fears as to the ability of the company to continue the dividend of 9 per cent. paid a year ago on the ordinary shares. Counties are keeping very steady, and at 10 the price is full of dividend, showing a yield, therefore, of over 7 per cent. on the money, provided the distribution of last year is repeated.

Smithfield Markets Electric Supply Co. shows a net profit of £2,816—a decline of £323 as compared with last year. The dividend is maintained at 2 per cent. The shares have not changed hands since last October, when a bargain was marked at 17s. 1½d. For 1913, by the way, the dividend was 2½ per cent.

British Westinghouse preference have eased off to 44s. 6d. British Aluminium fell sixpence to 22s.; there are some 6 per cent. preference on offer about 18s., which are cheap as compared with a good many other of the 11 preference shares so popular at the present time. Why there should be a run after this particular class of shares it is difficult to see, but, in point of fact, the preference issue of any sound industrial company is readily taken nowadays, and at a price which looks extravagant when it is compared with the quotations for trustee securities.

The Home Railway market is quiet, with Underground Electric incomes once more the principal feature of strength. The price has risen another ½ upon the declaration of the full £3 per cent. interest on the bonds. The other dividends from the Associated Electric Railway companies are in accordance with general expectation, but it must be confessed, now that the dividend is out, that none too much certainty was felt about the before-mentioned coupon for £3 being paid in full next month, although the odds were strongly in favour of it. Metropolitan ordinary stock is a dull market at 24, as which

price it still looks too high. Districts loiter about 15, and there is no alteration in Central London stocks.

Brazil Tractions have risen to 5½, thanks to a recovery in the Rio exchange to 1s., a subsequent reaction to 11 15/16d. being regarded as negligible. The rally wipes out the greater part of last week's fall. Anglo-Argentine Trams are wanted, and most of the other securities associated with the Argentine Republic have come into request, from the National bonds downwards. Mexicans are very weak. No quotable changes are marked in the prices, but the feeling of disappointment deepens—disappointment mainly concerned with the failure of the United States to take any real steps towards the settlement of the country.

The Telegraph market is scarcely so firm. Eastern ordinary has recovered 10s., after its fall of last week; but the Anglo-American group is a little easier, and Globe preference went back to their par value of 10. West India and Panama shares are 1/16 lower. New York Telephone bonds keep at 10½, the Government price. More business in Marconis has resulted in the quotation improving to 1 31/32; but the subsidiaries are dullish in tone, Americans, for instance, being 16s. 3d. and Canadians about 6s. 6d.

Telegraph Constructions, in the manufacturing group, are £1 up at 37; and at 10½ British Insulated ordinary show a 5s. rise. Babcock & Wilcox keep steady. The armament group is dull, though the Webley & Scott Co. shows its profits quadrupled, as compared with those of a year ago. The rubber market is active and strong, the raw material having risen to 3s. 7d. per lb., which brought in a fresh accession of buyers for all the popular shares.

City and South London Railway Co.—Final dividend 2½ per cent., making 5 per cent. for the year on the 5 per cent. pref. stocks, carrying forward £9,027.

Kensington and Knightsbridge Electric Lighting Co., Ltd.—Final dividend on the ordinary shares 4 per cent., making 7 per cent. for 1915, as compared with 9 per cent. for 1914.

Newcastle and District Electric Lighting Co., Ltd.—Owing to war conditions no dividend is recommended for 1915. For 1914 3 per cent. was paid.

London Electric Supply Corporation, Ltd.—Dividend on the ordinary shares 3 per cent. for 1915, as compared with 4 per cent. for 1914.

Tottenham District Light, Heat and Power Co.—The electricity department receipts for 1915 were £574, and the expenditure was £547; balance £27.

NOTES ON ELECTRIC WELDING PRACTICE.

(Concluded from page 184)

As a final example, fig. 27 shows the Clarkson system of building up steel wheels for automobiles by butt welding. Radial bosses on the drop-forged nave *a* are drilled and machined externally to form a short tubular section of diameter and area equal to that of the tubular spoke *b*, which is then welded in place. At the outer end a rim attachment, consisting of a tubular section (equal to that of the spoke) expanding in the form of an elliptical "bell" to the curved flange plate, is welded to the spoke, and the rim is then shrunk on after machining the periphery of the attachment plates. An exceptionally strong and neat construction results.

"After-working."—After completing an electric weld, and usually whilst the metal is still hot, a thermal or mechanical treatment may be given with a view to relieving possible internal stresses, hardening or softening, or to remove or re-fashion extruded material. In arc welding the arc may be "played" by a skilled workman so as to prevent severe contraction stresses being set up, and it is common to hammer the joint by hand whilst it is cooling. Percussive welding does not heat the work appreciably; no thermal after-treatment is required, and the only mechanical finishing necessary is to grind off the fin which is quite thin but usually sharp.

If it is required to anneal a butt welded joint, it is only necessary to increase the jaw separation somewhat and pass a gradually decreasing current (considerably less than the welding current) through the

27

28

29

30

FIGS. 27-30.

joint. If the material has to be hardened it can be heated to any desired degree electrically and then quenched. Opening and closing the switch so as to pass the full welding current intermittently is a possible means of causing moderate heating, but is not recommended for regular practice. Incidentally, it may be noted that "resistance heating" in a butt

31

32

FIGS. 31-32.

or spot welder can often be used very advantageously to heat parts for bending, forging, hardening or annealing, whether or not welding is actually performed. Annealing is essential at welded joints in

high carbon and certain other alloy steels. On the other hand, a weld in copper is soft, so that if the joint is in wire which has to be redrawn, the whole should be annealed.

FIG. 33.

Often it is desired to leave a welded joint of the same size as stock in which it is made. This is practically the case if sheets are chamfered and arc

FIG. 34.

welded, but in butt-welding a burr is necessarily formed, which may be swaged down by hand or automatically by hammering or pressure. Fig. 28 shows in principle a means of overcoming the difficulty of true edge-to-edge butt welding between thin sheets and also of reducing and smoothing the burr formed.

To form a smooth joint between two bars the end of one may be split and played as in fig. 29, or shaped as in fig. 30, so that when welding heat is reached, and the jaws *JJ* and swaging blocks *SS* are all moved inwards, practically a cylindrical joint remains. There is obviously a risk that full welding heat will not be reached all over the section and that foreign material may be included in the joint. For most purposes a plain butt joint is simplest and best, the burr being ground off if necessary. The object of the special arrangements shown in figs. 29 and 30 is not so much to avoid a burr (which could be ground off) as to prevent shortening the stock whilst still permitting that displacement of metal at the moment of welding which is necessary for satisfactory union. A method serving the same end and tending to greater reliability in the body of the weld is to force in a "filling" pellet or strip of metal at the joint, subsequently grinding off surplus material.

Current Supply, Regulation and Consumption.—Generally welding equipments are sold complete and installed under expert supervision so that arrangements for current supply are generally suited to the

work to be done. Though well known to every electrical engineer, it is not so generally appreciated amongst those using or interested in welders that only 50 or 60 volts is needed or can be used effectively by a carbon arc (less by metal arcs), so that a low voltage motor generator is generally good business. A constant current generator overcomes much of the difficulty of drawing a steady arc of suitable intensity on the work itself. Connections for the Kramer constant current, commutating pole dynamo are shown in fig. 31, where *c* represents the commutating pole winding, *se* a differential series field winding, *sh* a shunt field system, and *ex* a separately excited fine wire field winding. By adjusting the regulator *R1*, the dynamo voltage is controlled whilst the regulator *R2* adjusts the welding current. Once adjusted, the latter remains constant over a considerable range of weld resistance (e.g., 150 amps. from 0 to 0.5 ohm weld resistance, falling to 100 amps. at 1.1 ohms). Since a single arc welder is rarely employed, and since some hundreds of amperes each is a reasonable average, supply has to be taken from power or traction mains, and this renders a low voltage set commercially essential. The latter should be used with a switchboard containing voltmeter and ammeters, controllers for the motor and compound generator, and an automatic short circuiting switch. Alternating current is not suitable for arc welding.

FIG. 35.

Percussive welding needs only a large electrolytic condenser and charging motor generator, the general arrangement of the circuit being as in fig. 32, where *G* is a c.c. dynamo charging a discharge circuit *R1*, *K*, *L* through a variable high resistance *R2*. The switch *s* short circuits the lines *MM* whilst work is being inserted in the welding jaws *AB*. By a suitable mechanical device, the switch *s* is opened (permitting *K* to become charged), and the falling jaw *A* is released practically simultaneously. The welding action which occurs directly the piece *A* reaches *B* has been described already.

The current consumption in a butt weld is reckoned by thousands or ten thousands of amperes, though the p.d. required across the weld is only a few volts. Obviously alternating current supply is the only practicable solution, primary supply at 100 to 500 volts, single phase, 50 cycles being convenient. Regulation of the secondary current may be by reactance in the primary, by varying the primary turns or by varying the supply generator excitation if a special generator be used. Varying the effective primary turns, say to 75%, 50%, and 25% maximum, by a plug switch (this eliminating the risk of short-circuiting turns), gives coarse control which can be amplified by finer sub-division, by reactance, or, to some extent, by varying contact pressure between the pieces

heated. The circuit is naturally opened in the primary to save damage to switches, jaws or work, by attempting to interrupt the heavy secondary current directly. If considered necessary, a choker with rising and falling core can be used to smooth out the current demand. All but very heavy welders can be run unbalanced on one phase of a 3-phase power network.

As regards actual energy consumption, this has formed the subject of a number of special papers and articles, and really demands detailed treatment since the mechanical form of the work modifies considerably the energy consumption for a weld of given area (an extreme case, for example, being the difference in consumption for a weld between two bars and a weld in a small ring of the same sectional area). Within comparatively wide limits, and particularly in the case of butt welding, a satisfactory joint can be made with a certain current for a certain time, or with a less current for a longer time. Naturally the energy consumption is greater in the second case, owing to the greater heat losses, and for every piece of work there is a best all-round current and time. The permissible range of current is much greater with wrought iron or mild steel than with brass or aluminium.

A collection of curves based on data from a variety of sources is presented graphically in figs. 33-35; figs. 33 and 34, referring to butt welding, and fig. 35 to spot and lap welds: the curves can only be accepted as a general guide, since the number of variables is great and their effect complicated. Somewhere about $\frac{3}{8}$ in. of metal per kw.-hour can be filled into blow-holes, etc., using a metal electrode arc process, and from 10 to 20 ft. per hour of seam can be arc welded in steel plate according as the latter is $\frac{1}{4}$ to $\frac{1}{8}$ in. thick. On repetition work surprising outputs can be attained in butt and spot welding machines, though the actual figures depend largely on the exact mechanical form of the work. Hoops and tires from 2 to 9 inches in width can be welded at the rate of 10-15 per hour; 600 to 1,000 or more spot welds, each equivalent to at least one rivet, can easily be made per hour, and chain links can be welded at a similar rate.

An immense variety of electric machines are now available to meet practically any needs. One or other of the basic systems, arc, resistance or percussive welding, is employed in each case, the distinction between the innumerable machines operating on each system lying in such important mechanical details as jaw opening and closing gear, upsetting mechanism, contact cooling, and general arrangement of controls. The art and science of electric welding have been brought to such perfection that there are few metal-using industries in which electric welding does not or could not find very advantageous application.

BRITISH TRADE AFTER THE WAR.

(Concluded from page 165.)

On the subject of trade exhibitions, the Sub-Committee says:—

Trade Exhibitions.

"It was the general opinion that the organisation by private enterprise of exhibitions for financial profit, including and encouraging retail stalls, entertainments and side shows, is of no substantial benefit to traders; on the other hand, the highest appreciation was expressed of the British Industries Fair organised by the Board of Trade, and it was urged upon us that the Fair should be repeated and, if possible, made an annual institution. Emphasis was laid on the necessity of maintaining the Board of Trade control, and of stringently enforcing the rules as to exhibition by manufacturers only, and the exclusion of the general public. It was also suggested that the longest possible notice should be given, so as to give over-sea buyers ample opportunity to attend. The B.E.A.M.A. represented that in their opinion the expenditure of Government money on British participation in recent international exhibitions abroad had not greatly benefited British industry."

The Committee recommends that the following broad principles should be adopted in respect of future trade exhibitions:—

(a) Trade exhibitions should be held under the control of the Board of Trade.

(b) Exhibitions should be exhibitions of manufacturers' wares for traders, and should not be organised with a view to attracting the general public.

(c) Exhibitions should not be too general in scope, but should be for a limited number of branches of industry at a time, according to the importance and dimensions of each particular industry in this country.

(d) At least one year's notice of the intention to hold any particular exhibition should be given to manufacturers.

As regards the Merchandise Marks Act, practically all the witnesses urged that the provisions of the Act should be strengthened so as to require compulsory marking indicative of foreign origin, that such marking should be on every imported article to which the requirement extends, and that mere marking of the wrapper or other packing should not be sufficient. In the case of glassware it was suggested that the marking should be in the glass itself. A number of witnesses expressed strongly the opinion that goods of enemy origin should be marked distinctly with the name of the country of manufacture, and not with some less definite indication, such as "foreign made," or "not British."

"Some of the witnesses urged that the Customs should prevent the entry into this country of goods which bear infringing trade marks, but it would appear that the existing arrangements in this respect are not fully known or understood. We understand that the Customs have at present a system of registration of trade marks, the property of manufacturers, dealers, or traders in this country. Under this system a manufacturer who has reason to believe that his name or trade mark is one not unlikely to be imitated so as to constitute a forgery may apply for registration for his name or mark. On such registration being completed the Customs officers are apprised, and in the event of any goods bearing such name or trade mark being observed by them in the course of their examinations, the firms registering are immediately informed, and on their statement that the marks are infringements, the detention of the goods is continued. A bond is entered into by the firm to cover this detention, and unless some satisfactory arrangement is concluded between the importer and the possessor of the infringing mark the goods are in due course confiscated."

The Committee received various representations respecting the protection of British trade marks abroad. Its recommendations are as follow:—

(a) All German and Austrian goods imported into the United Kingdom should be required to be marked with an indelible mark "Made in Germany," or "Made in Austria-Hungary," and goods imported from other foreign countries should be similarly marked either with the country of origin or with the words "Foreign made" or "Not British." Such marking should be in all cases on the actual goods, and not merely on the package.

(b) Alien firms and alien-owned companies should be prohibited from registering in the United Kingdom trade marks containing English words.

(c) The Government of India should be urged to reconsider the question of the establishment of trade mark registration in India.

(d) As regards the entry into this country of goods bearing infringing trade marks, there seems nothing to complain of in the Customs practice set out in the above quotation, as a public department cannot be called upon to undertake actions for the protection of private rights, and we endorse it, but there is an additional requirement which should be put into force, viz:—

"As a part of the information to the firm affected by the infringement, there should be supplied as a matter of course, the names of the consignee and consignee, which have hitherto been withheld on the ground that the Customs have no power to give the required information, which is in many cases actually in their possession. In cases where shippers, or brokers, are alone concerned in the importation, the Customs should be enabled to require full information as to the original consignee, and the actual consignee, as a condition of entry of the goods, and this should be effected by legislation, or by regulation, as may be found necessary. In support of this view it is only necessary to point out that the first step in any action for infringement is to ascertain the identity of the infringer, and that this should be withheld by a British department, when in its possession, is wrong as a question of policy, and really amounts to a screening of the offending foreigner, and the confederate recipient in this country, who is often a mere agent of the consignee, occupying a small office. The Customs should, therefore, in our opinion, be furnished with necessary powers and required to use them when granted."

"His Majesty's Consular Officers should be directed, so far as practicable, to watch for, and report immediately with the fullest details obtainable, cases of the apparent infringement of British trade marks, or attempts to pass off foreign-made goods as British."

The B.E.A.M.A. and the Paper Makers' Association made suggestions on this subject. The Committee says that the suggestion is believed to be due "to a feeling in trade circles that the great variety of duties which the Board

of Trade has to discharge unavoidably prevent that concentration of attention on commercial and trade matters which is desirable." The B.E.A.M.A. further urged that it should be the duty of the Ministry of Commerce not only to promote trade but "to champion its cause against any other Department which seeks to impose restrictive conditions." The Association's witnesses took exception to the connection of a Ministry concerned in the development of trade with a Department which issues "regulations as to public safety and all the numerous regulations which emanate from the Board of Trade."

On this point the Committee recommends:—

"H.M. Government should be urged to consider anew the advisability of establishing a separate Ministry charged solely with the safeguarding and extension of British industry and trade, and freed from the regulative duties in respect of Railways, Shipping, and Harbours, and the duties in respect of Labour, which at present devolve upon the Board of Trade."

Trade Commissioners and Consuls.

It was suggested to the Committee that the system of Trade Commissionerships under the Board of Trade, which has proved so successful in the Self-Governing Dominions, should be extended to the principal foreign countries. "We heard a certain amount of criticism of the Consular Service. Whilst no doubt there has been justification in the past for some of the complaints as to the inattention of Consular Officers to commercial matters, and their inexperience in regard to them, and weak spots are still to be found in the existing organisation, we think that the general level of the Consular Service in this respect has risen appreciably in recent years. We are of opinion that more weight should be attached to commercial knowledge and experience in the appointment of Consular Officers, though we recognise that other considerations must be taken into account; but in regard to both Trade Commissioners and Consular Officers we may point out that we are informed by the Board of Trade that numerous complaints are received from both classes of officials that British traders and their travelling representatives do not make sufficient use of them, and that the officials are thereby deprived of the opportunities which they desire to have of obtaining at first hand practical information as to the particular ways in which they might be of service to British manufacturers and merchants."

The Committee recommends on these points:—

"The appointment of Trade Commissioners responsible, and reporting directly, to the Board of Trade, should be extended to the principal foreign countries."

"The organisation of the Consular Service should be dealt with as soon as possible after the completion of the Report of the Royal Commission on the Civil Service, with a view to the increase of its commercial utility."

The Metric System.

The B.E.A.M.A. urged that a Government inquiry should be instituted into the desirability of adopting decimal coinage and the metric system both for this country and in the Dominions. "The use of the metric system is, of course, already permissible; as to any Government action beyond that we are aware that opinion is divided, and we content ourselves with recording these suggestions."

Travellers and Catalogues.

The Committee recommends:—"Representations should be made to the Governments of the Self-Governing Dominions and of the Colonies with a view to the preferential treatment of British commercial travellers in respect of licence fees."

"Representations should be made to the Governments of such British possessions as levy import duties on imported catalogues and trade circulars, with a view to the substantial reduction of such duties in respect of the catalogues and circulars of British manufacturers."

Technical Training.

The Committee refers briefly to the "insufficient importance attached in this country to technical training, in spite of the progress made in some directions, and the advantages which the manufacturers of Germany have derived from the more developed and systematic schemes in operation there. Suggestions as to the failure by employers and employed alike to appreciate the full importance of technical training were made in several instances. "We were glad to learn, however, that in the glass industry there are signs of a marked improvement in this respect."

Those Continental Tours.

We can almost hear the smile of some of our readers as they remember some electrical excursions which may not have been in the mind of the Committee when it penned the following:—

"The other matter to which we would direct attention is the attraction which Continental buying exercises upon British distributing houses. The periodical visit to the Continent, combining a business tour with a pleasant holiday, and the entertainment provided by German manufacturers, presents strong attractions to the representatives of British distributing firms, and is not likely to be given up by them unless there are very strong motives for such action. The cumulative effect of this particular consideration on a large number of firms in leading them to prefer to deal with Continental makers, even when British firms are offering goods of similar quality at competitive prices is, we think, very considerable."

The Committee says that the preceding matters were, in the representations made to it, of secondary importance in comparison with the question of the possibility or otherwise of tariff protection after the war. Practically all the representative firms and associations consulted asked for a measure of Protection. The reasons advanced were as follows:—

"There is a general fear that, immediately after the war, this country will be flooded with German and Austro-Hungarian goods, sold at almost any price, and that the competition in price which was going on before the war will be accentuated, with resultant serious difficulty to all manufacturers of goods of kinds exposed to this competition, and positive disaster to those manufacturers who have been encouraged to extend their operations, or engage in new branches of industry, with a view to capturing trade hitherto carried on by enemy countries."

"The causes of the ability of German firms in the past to undersell their British competitors, on which most emphasis has been laid in the representations made to us, are:—

"(a) The low railway rates charged in Germany on goods for export, and other transport advantages.

"(b) The industrial combinations in Germany, which, with a large home market secured to them by the tariff, were able to produce on a large scale and to dispose of their surplus product abroad at very low prices.

"(c) The low rates of wages prevailing in certain industries in Germany."

"In some cases it was admitted that lower wages are not the cause of the lower prices at which German goods are offered. Thus we were informed as regards paper-making that 'the labour bill, for the same class of output, is much the same in Germany as in Bury'; that in the electrical industries 'in 1913 hours of labour were slightly longer in Germany than in England, wages were about the same in the two countries, and the standard of labour was better in Germany.'"

"The conviction that the prices at which German goods will be offered in the British and neutral markets after the war will be even lower than the pre-war quotations is based on two assumptions—first, that in some branches of industry at least Germany has been accumulating large stocks during the war, and secondly, that immediately upon the conclusion of peace she will make every effort to recover her position in the world's markets, and to crush nascent competition, and that in carrying out that policy cheapness will be a potent weapon. Whatever may be the truth as to the accumulation of stocks, we do not think the validity of this second assumption is open to doubt."

The Committee directs special attention to magnets, to magnetos, and to magnetos.

Prior to the outbreak of the war the trade in magnets, which are of great importance for all forms of motor-cars and aircraft, as well as for other purposes, was virtually monopolised by the Bosch Co., of Stuttgart, a very powerful organisation with great resources. The result was that the sudden commencement of the war, and the consequent restriction of imports of goods from Germany, placed manufacturers in this country, where the normal demand was about 5,000 magnets per week; since then it has substantially increased, especially for military and naval purposes. A number of British firms took up the manufacture, and while the assistance of the Government in the production of magnet steel, they have succeeded in making magnets which have passed the Government tests and are asserted to be as good as the Bosch products. The firms are receiving large Government contracts, and there seems to be no doubt that this industry (which is specially important as being one of a "key" industry) a considerable British manufacture could be built up which, *inter alia*, would guard against a repetition of the serious difficulties caused in the early stages of the war by our dependence on foreign supplies. The one obstacle is the fact that the firms concerned are not committing themselves to further capital outlay, and the unwillingness of outside capital to come to their assistance, unless assured of some security against the strenuous efforts which the powerful Bosch concern will undoubtedly make after the war to break down the new British enterprise. The representatives of this industry asked that Government assistance might be rendered them in the shape of (1) an undertaking that the Government Departments concerned in motor transport and the air services would undertake to make use only of British magnetos made so far as practicable only of British parts; such undertaking to be for a term of years after the conclusion of the war; and (2) the extension to all magnets of the import duty of 33½ per cent. imposed upon magnets imported as parts of motor cars. We reported to the President of the Board of Trade that, in view of the importance of the manufacture of magnets for military and naval purposes, its position as a "key industry," the efforts which the manufacturers have made, and the undoubtedly severe competition from the powerful Bosch interests which they will have to encounter after the war, we were unanimously of opinion that Government assistance might be given in the form of the measures proposed by the industry.

The amount of the tariff duties which it was suggested should be imposed naturally varied with the different branches of industry.

The following resolution, recently passed by the Council of the British Electrical and B.E.A.M.A. Allied Manufacturers' Association, was communicated to the Committee:—

Protection Proposals. "Resolved, that it is the considered opinion of the Council of this Association that the Government should, as soon as possible, proceed to formulate a tariff scheme, embodying:—

1. An Imperial Customs Union between Great Britain and her overseas Colonies, Dominions, and Dependencies, with a view to the adoption at some later period of free trade within the British Empire.

2. A tariff on all goods imported into this country which are such as can be efficiently and economically manufactured in British workshops.

3. That a substantial preference should be given to all goods, whether manufactured or otherwise, imported from any of our overseas Empire.

4. That a smaller preference than the foregoing be given to those countries which are now allied with us in defeating the right of national existence against the dominating influence of the Central European Powers.

5. That such preference as may be possible be given in view of the balance of trade between nations, be given to neutral countries.

6. That the duty imposed on goods of Austrian and German manufacture should be of a highly protective character, not only in Great Britain, but also in the overseas parts of the Empire."

Some other suggestions were put forward for the protection of British manufacturers in other ways. These are:—

(a) The confederation, or imposition of a substantial duty on, imported goods unaccompanied by a British Consular certificate to the effect that the goods are not imported to this country at a lower price than would be obtained for them in the domestic market of the country of manufacture (i.e., "anti-dumping" legislation).

(b) Restriction of British Government contracts to British goods, or a preference to such goods in respect of price. The reasonableness of this claim was strongly urged upon us by representatives of the new magneto industry, and also in the case of table glassware.

The British Science Guild reported that a large number of educational institutions and authorities had already undertaken not to purchase any chemical glassware of foreign manufacture for a period of three years after the war, provided that an adequate supply of British manufacture is forthcoming.

(c) That in respect of the raising of loans or the levying of taxes by municipalities or public bodies for carrying out works of public utility, it should be a condition imposed by the Central Government that preference be given to British manufacturers. Such preference might, it was suggested, be limited to 10 per cent., as a check upon trade combines.

On this matter the Committee recommends:—

The Committee Recommends. "Tariff Protection.—Where the national supply of certain manufactured articles, which are of vital importance to the national safety, or are essential to other industries, has fallen into the hands of manufacturers and traders outside this country, British manufacturers ready to undertake the manufacture of such articles in this country should be afforded sufficient tariff protection to enable them to maintain such production after the war. With reference to the strongly-expressed opinion of many of the witnesses that the enactment of protective duties on the industries other than those referred to in the preceding paragraph, which have formed the subject of our inquiry, is essential to their maintenance, we wish to report that in view of the following considerations:—

(a) That there exists a strong desire to respond to the feeling in our Dominions in favour of an Imperial preference in trade, and that there is also a strong desire to arrange preferential trading with those who are our Allies in the present war, and

(b) That the present high direct taxation tends to raise the rate of interest on money, and cheap and abundant capital for the employment of their labour is of the greatest importance to the working classes,

it will be necessary to impose some widely-spread import duties, and we are therefore prepared to recommend that a larger proportion of the revenue should be raised by reasonable import duties. We are of opinion that such import duties would go a long way towards satisfying the requests for special protective treatment for the industries which we have had under consideration. We would only add that in view of the threatened dumping of stocks which may be accumulated in enemy countries, the Government should take such steps as would prevent the position of industries, likely to be affected, being endangered after the war or during the period required for a wider consideration of the whole question."

The recommendations of the Committee are subject to this consideration:—

Cold Water and a Reservation. "We are fully conscious of the limited range of the inquiry, and that the particular branches . . . cannot well be singled out for special Government action; our investigations have been devoted only to a comparatively small portion of the immense field of British industry, and the conclusions at which we have arrived might consequently be modified in some respects were the range of inquiry to be extended."

The signatories to the report are:—Algernon F. Firth; A. J. Hobson; Stanley Machin; E. Parkes; and Albert Spicer. (Percy Ashley, Secretary.)

Sir Albert Spicer adds a reservation in respect to the immediate enactment of protective duties, which concludes as follows:—

"In view of these recommendations, which are all protective in effect, and of the fact that during the continuance of the war manufacturers are automatically protected, and that for some years after the war protection, equivalent to import duties, is likely to be afforded by the prejudice against German and Austrian goods, I feel that the consideration of a tariff for these special industries should wait until after the war, unless it can be undertaken earlier, when the whole issue can be again considered in the light of what, I hope, will be an agreed policy with our Dominions overseas and our present Allies."

Electrolytic Disinfectant.—Our contemporary, *Nature*, in a note on new antiseptics refers to the use of electrolysed sea-water for the disinfection of hospital ships, remarking that though the production of hypochlorite by the electrolysis of salt solution for bleaching purposes, and the powerful antiseptic properties of hypochlorite so produced, have long been known, the idea of electrolysing sea-water on the vessel which is to be disinfected is a novel one. It is due to Dr. H. D. Dikin, whose apparatus consists of an electrolytic cell, which, with a current of 65-75 amperes at 110 volts, yields a solution of two parts per 1,000 of hypochlorite at a cost of about 3d. per 100 gallons. This solution, diluted with an equal volume of sea-water, is sufficiently strong to sterilise floors, decks, latrines, &c. It has been used on the *Aguizania* on her last two voyages, with excellent results.

THE ELECTRIC ARC IN VAPOURS AND GASES AT REDUCED PRESSURES.*

By W. A. DARRAH.

A study of the light efficiency of an arc from a chemical standpoint, shows that there is a certain rather limited class of substances which, when introduced into the arc in small quantities, produce a very great increase in luminosity. Thus the addition of small quantities of cerium or calcium compounds to the carbon arc may increase its efficiency over 300 per cent. and the addition of titanium (preferably as an oxide) to the magnetite arc similarly produces an increased luminosity without a corresponding increase in energy consumption.

A study of these facts led to the conception that perhaps an arc could be maintained in a closed vessel and supplied with these light-producing elements in the vapour form. Titanium, tungsten, and other elements which increase the luminous efficiency of an arc, may readily be secured in the form of volatile liquids.

Preliminary tests having indicated the possibilities, as well as the difficulties to be overcome, lamps were constructed and a detailed study was made of the effects of the various available electrode materials, the different vapours, and different designs of lamp. A hard glass was employed, which allowed of the sealing of tungsten wires and rods directly into the globe with the aid of a flux of potassium nitrate and borax. This enabled heavy seals to be used. Figs. 1 and 2 show designs which were found fairly satisfactory.

The lamp consists essentially of a chamber at the centre of which an arc is drawn between tungsten electrodes about $\frac{1}{16}$ in.

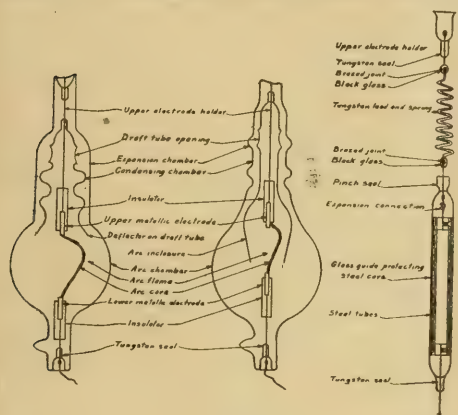

FIG. 1.

FIG. 2.

FIG. 3.

in diameter. The electrodes are partly surrounded with a refractory insulator, intended to keep the arc from moving far from the ends of the electrodes, as this allows the arc to extend and ultimately to rupture. The refractory insulator, also assists in keeping the electrodes at a high temperature, thus increasing the efficiency of the lamp and the stability of the arc.

The upper electrode is fastened by means of a tungsten rod to an iron core, which is surrounded by a glass shell to protect the iron from corrosion, as the vapours used readily attack nearly all metal except tungsten, platinum, gold, and a few other inert materials. A flexible tungsten spiral serves to conduct the current from the upper movable electrode to the upper seal, fig. 3.

It was found, after a number of trials, that a certain combination of gases gave a minimum amount of decomposition products, which gradually collected upon the globe, thus reducing the amount of light radiated. In order to overcome this difficulty, the arc chamber was extended above the upper electrode, thus forming a condensing chamber in which the soot could collect, allowing the walls to remain clean. A draught tube was placed around the upper electrode in such a position that the heated gases from the arc would pass upward through the draught tube out into the condensing chamber, and then back downward into the arc chamber for use again. The corrugations shown on the draught tube and condensing chamber were found to aid the condensation of the suspended matter.

The search for a satisfactory electrode material showed that carbon was unsatisfactory. Tungsten proved to be practically inert, even at a white heat, in the presence of the various vapours used. The tungsten terminals, moreover, did not melt or evaporate in the arc except at a very slow rate, which seemed to be comparable to the evaporation of the filament in an incandescent lamp.

The arc in this lamp is quite different from that of other commercial arc lamps (see fig. 4). It is usually very stable, about $\frac{1}{16}$ in. in diameter, tubular in form, and varies from 2 to 5 in. in length

with 110 volts direct current, the variations being due to differences in pressure, nature of the gases supplied, &c. A high pressure increases the intrinsic brilliancy of the arc, but makes it necessary to operate at a shorter length, as the gas currents due to temperature differences and arc reaction are correspondingly more violent. The diameter of the central luminous tube is also reduced with an increase in pressure.

The general appearance is that of a thick intensely white incandescent filament slightly bent at the upper end. With some of the vapours, as, for example, the metaloid halogen compounds, antimony, phosphorus, and arsenic chlorides, the central tubular portion is surrounded by a ragged flame, which is light pink in the case of arsenic and pale green in the case of phosphorus.

The flame portion acts somewhat as an absorbing screen, thus reducing the total useful radiation. It is a curious fact that this flame may exist for a short but appreciable time after the circuit has been interrupted, thus indicating that it probably does not have a part in the conduction of electricity through the vapour, but appears to be a zone in which the vapours, after being dissociated by the heat and electrical effects of the arc, recombine. The spectrum of the flame is usually quite different from the arc spectrum, and is characteristic of the elements involved, while the spectrum of the arc is independent of the ends of the electrodes (which, of course, give a hot-body spectrum) is usually a band spectrum, and is practically continuous except for a few absorption lines.

The electrical characteristics of the antimony pentachloride lamp are shown in fig. 5, plotted between arc length and voltage. The curve indicates that a 4 in. arc at 10 amperes requires no more voltage than a 1-in. arc at 2 amperes. A 10-ampere arc is four times as long as a 2-ampere arc, and its intrinsic brilliancy is

FIG. 4.

FIG. 5.

about five times as great; accordingly, the light emitted by it under these conditions is 20 times, and the efficiency approximately four times that of the 2-ampere arc.

The efficiency ranges from 1 watt per mean spherical candlepower to less than one-quarter of the value. This performance may be secured with a white light which closely resembles afternoon daylight (north sky).

While the results set forth in the paper offer considerable promise from a practical standpoint, they are not presented for consideration as representing a finished device, but merely a research in what seems to be a new and interesting field.

Science and Industry.—On January 5th a conference was held in Melbourne to consider the Federal Government's proposal for the establishment of a national laboratory. The Prime Minister has stated that the Government intends to secure the services of the best scientific men available, and that the resources of Australia are to be systematically developed on scientific lines.

X-Ray Dangers.—Although the dangers attending the irradiation by X-rays are now generally recognised, risks are often taken unnecessarily, through want of thought or knowledge of danger on the part of operators. The rapidly increasing number of radiographic laboratories and installations have brought into the field many workers of limited experience and there is fear that in the near future cases of X-ray dermatitis may develop among operators, nurses, and those working with X-rays generally, that would have been avoided by taking proper precautions. The Council of the Röntgen Society has, therefore, formulated an excellent card set of recommendations which, if followed, will give a large measure of protection from the known dangers attending the use of X-rays, and it is suggested that the card, which is now ready, should be affixed in a prominent place in all departments where X-rays are generated.

* Abstract of a paper read before the American Electrochemical Society, in joint session with the Illuminating Engineering Society, on November 11th, 1915.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

BRITISH DOMINIONS AND POSSESSIONS.—A Supplement to the *Board of Trade Journal* of January 13th contains lists of prohibited exports, classified under their respective headings in alphabetical order, from British India, the Self-Governing Dominions (other than Australian), Egypt, and certain other British Possessions. The information in the present Supplement supersedes that given in the Supplement dated October 14th last, and the lists have been amplified by the inclusion of particulars for Malta, Mauritius, Jamaica, Barbados, and British Guiana. Copies of the Supplement may be obtained, price 3d., from the usual sale agents for Government publications.

FRANCE.—In virtue of a Decree of the French Minister of Finance, dated December 10th, certain goods whose exportation and re-exportation had been prohibited by a Presidential Decree dated December 7th, are allowed to be exported or re-exported from France, without special authorisation, when consigned to the United Kingdom, the British Dominions, Colonies, and Protectorates, Belgium, Japan, Montenegro, Russia, Serbia, or American countries. The list of articles includes the following:—Accumulators and accumulator plates; manufactures of aluminium and oxides; antifriction metal; copper, pure or alloyed, in all forms; electrodes, electric batteries and their elements; tin, pure or alloyed, in all forms; engine and boiler packing, including slag wool; manganese (metal) in all forms; mercury (compounds and preparations of); molybdenum (salts of); worked mica; nickel, pure or alloyed, in all forms; salts of copper, chromium, tin and mercury; silicon; sulphates of soda and zinc; titanium (salts); tungsten (metal) in all forms; vanadium salts; zinc manufactures.

BRITISH INDIA.—The exportation of mica has been prohibited from British India to all countries except the United Kingdom and British Possessions, as from November 19th last. The prohibition does not, however, apply to goods shipped by or for the use of the Crown.

SOUTH AFRICA.—Customs decisions have recently been issued in the Union of South Africa and also in Southern Rhodesia in virtue of which the rate of import duty on concentrated accumulator acid (consolidated sulphuric acid) is to be 20 per cent. *ad valorem* under the general tariff. In the Union of South Africa the rebate allowed to the product of the United Kingdom or of reciprocating British Possessions is 3 per cent. *ad valorem*; in Southern Rhodesia, however, the rebate is fixed at 9 per cent. *ad valorem*, and is allowed to all British Possessions, whether reciprocating or not.

By a further decision of the Union of South Africa Customs Authorities the duty leviable on commercial silica under the general tariff is 20 per cent. *ad valorem*, with a rebate of 3 per cent. *ad valorem* to the product of the United Kingdom or reciprocating British Possessions.

NETHERLANDS.—A Dutch Royal Decree dated December 10th prohibits the exportation of graphite and articles made therefrom, whether as raw material or manufactured, unless forming parts of manufactured articles of which graphite is not the main component part.

FRENCH COLONIES.—A French decree dated December 27th provides that mica in sheets or leaves, and micantite (the exportation of which was prohibited by a decree of December 9th) may be exported and re-exported, without special authorisation, when consigned to the United Kingdom, the British Dominions, &c., Belgium, Japan, Montenegro, Russia, Serbia, or American countries.

SWITZERLAND.—By a Swiss Federal decree of December 30th, the exportation from Switzerland of asbestos, mica and micantite—in sheets, even if combined with tissues; and in pipes and other specially-shaped articles, even if combined with other materials—is prohibited as from January 3rd.

STATE OF BRUNEL.—Revised import and export duties have recently been announced in the State of Brunei, among which may be noted an export duty on Para and other cultivated rubbers of 24 per cent. *ad valorem*. Formerly, rubber was not specifically tariffed.

PORTUGAL.—A Portuguese decree dated December 27th prohibits, as from the date of the decree, the exportation of certain articles from Portugal and the adjacent islands. By way of exception, the Minister of Finance may permit, in certain circumstances, the exportation of these articles on payment of special export surtaxes in addition to the ordinary export duty. Among the articles included in this restriction are the following:—

	Rate of surtax.
Tin or tin ore	1½ per cent. <i>ad valorem</i> .
Copper ore or cement	1 per cent. <i>ad valorem</i> .
Wolfram	30 escudos per metric ton.
Other ores not specified	1½ per cent. <i>ad valorem</i> .
Articles of copper, brass and tin	8½ per cent. <i>ad valorem</i> .

SPAIN.—An export duty on zinc in bars, lumps, cake, and scrap of 100 pesetas per 100 kilograms, net came into force in Spain on January 3rd, in virtue of a Spanish Royal Order.

EAST AFRICA PROTECTORATE.—New regulations dated November 10th, 1915, have been issued in the East

Africa Protectorate amending the requirements as to Certificates of Origin for goods imported from certain foreign countries. Certificates in the prescribed form must be presented to the Chief of Customs in respect of all goods imported into the Protectorate in trade with any foreign port, other than British ports, with the exception of those of Russia, Belgium, France, Italy, Spain, and Portugal, provided, however, that in respect of goods transhipped in the United Kingdom a duplicate of the "Specification for Foreign and Colonial Merchandise" (Form 30) or the Shipping Bill (Form 64), signed and stamped by the proper Officers of Customs in the United Kingdom, may be accepted in lieu of the Certificate of Origin. For the present, however, such Certificates will not be required in respect of individual consignments not exceeding £25.

BRITISH GUIANA.—The "Customs Duties Ordinance, 1916," provides for the imposition of duties on goods imported into and exported from British Guiana, with effect to December 31st, 1916, unless otherwise enacted. The rates of duty leviable under the new Ordinance are practically the same as those previously in operation.

A NUMBER of our manufacturers are at present making laudable efforts to secure a share in the large electrical trade that will be done with Russia after the war. Their immediate ability to meet the requirements of the market is restricted for various reasons, but for those who are not pre-occupied with other concerns the market presents great opportunities for them to assist our Ally. Everybody electrical now knows that Russia's electrical manufacturing capacity has been very small indeed, and nobody has known it better than German firms, who have done their best to keep it so. Russia has been in the past far too dependent upon those who wished to add Imperial domination to commercial conquest, and her statesmen and her business people too must recognise by now that, if the way had been less easy for that commercial success, the possibilities of the present lamentable state of war ever occurring would have been much reduced. With a manufacturing capacity and a modernised industrial organisation such as her national position and wealth called for, there might have been no shortage of munitions last year giving the enemy an opportunity to demonstrate the superiority of her industrial facilities. The same thing applies in regard to other countries as well, and there may be much heart-searching on this point in all of them before the conditions of a permanent peace are laid down.
